(S. John Cookson).—The leaves and berries you send are those of Berberis Aquifolium (Oregon Grape), a native of western North America, and therefore very hardy. The berries should, when ripe, be mixed with sand, either in the open or under cover, and allowed to remain until spring, when the pulp will have decayed, and about the end of March they should be sown in sandy soil, either in boxes or in warm borders, over which a glass light should be placed, although we have raised them by sowing in shallow drills in the open. This fine shrub may be used as a hedge, for it will reach a height of 6 feet when permitted to do so. It is not, however, used for this purpose generally, its great value being seen when used as an undergrowth beneath deciduous trees. The plants should be put out at 2 feet 6 inches apart.

Pruning shrubs

Is it a good thing to prune shrubs now, such as Prunus, Crabs, Lilacs, Syringas, Maples, Berberis, or to wait till autumn? Shall I cut them hard back, taking out all old wood, or shall I only cut the tips off? My soil is so poor and dry that they make very poor growth.

L. N.

[As your shrubs make such poor growth, why prune them at all? The main object in pruning flowering shrubs is the removal of old and exhausted wood, in order to allow the young and vigorous shoots (upon which so much of the future display of bloom depends) ample space for their development. This should be done immediately after flowering. No purpose is served by cutting off the tips, the result being simply to arrest the development of good, clean shoots, which in their turn will produce a crop of blossom. The thin shoots crowded towards the centre of the plants should be cut out in their entirety, but you must not remove enough to spoil the appearance of the specimen. If cut back now or in the autumn, this will be done at the expense of blossoms, and a season will be completely lost. That pruning is not needed to ensure plenty of flower is shown by the profusion with which many subjects bloom when growing wild, yet the removal of exhausted shoots ensures finer blossoms. We should advise you to leave your shrubs till the next flowering season, and then limit the pruning to the old shoots, as above detailed.]

Erica carnea

(S. W.).—The true species is a deep rosy-red. There is also a very pretty variety called rosea. The best pink we know is the one called Pink Pearl, a really lovely plant. W. H. Backhouse, King George, Winter Beauty, and præcox rubra are beautiful in every way, the two latter being the earliest of this fine group to bloom. Any of the above could be obtained from Mr. H. White, Sunningdale Nurseries, Windlesham, Surrey, or Mr. James Smith, Darley Dale Nurseries, Matlock, Derbyshire.

FRUIT

Pear Scab

(G. W. B., Northampton).—The specimen fruits Doyenne du Comice and Santa Claus are affected with Pear Scab, which is caused by the fungus Venturia pirina. The fungus attacks in turn the foliage, fruits, and young wood of the Pear. If the wood of the trees is affected, such portions should be cut away and burned. When the leaves have fallen in autumn they, too, should be raked up and burned. During the growing season three sprayings with Bordeaux Mixture should be given, using for the first a 4 : 4 : 50 formula, *i.e.*, 4 lbs. of copper sulphate, 4 lbs. of quicklime, and 50 gallons of water, while for the second and third sprayings 12½ lbs. of quicklime should be used instead of 4 lbs. The first spraying should be given when the flowers are in the "pink bud" stage, the second when the majority of the petals have fallen, and the third three weeks later. The "pink bud" stage is that at which the flowers are showing colour, but the petals are not unfolded. If the fungus is to be prevented from marking the fruit, it is important that the second spraying be not delayed beyond the time stated above. A few days' delay often means that the majority of fruits are badly marked instead of a few fruits being slightly scabbed. The fungus on Pear foliage is mainly confined to the undersides of the leaves; it is therefore important that the spray fluid is driven well under the leaves.

Vine failing

(Gardener).—From the specimens sent we can gather no information as to the cause of your trouble, but from your letter we gather that defective root action is the sole cause of the trouble. The Vine foliage sent shows no sign of disease, and we do not think the rod is likely to cause any trouble to the rest of the Vines, and you could cut away the rod at pruning time. Does the root of the plant get sufficient water, or, alternatively, does it get too much? Either condition could cause the trouble. You should examine the condition of the border and root system this winter, and if you care to send us along your observations afterwards, perhaps we could advise. A dressing of sulphate of potash at the rate of 1 oz. per square yard applied and well watered in would help the Vine if the border is not water-logged.

White Currant scale

(Gardener).—The specimens you have sent for examination are those of the Currant Brown Scale, Lecanium ribis. The young females begin to lay their eggs while the body is still soft and distended. As the egg laying proceeds, the insect develops a cavity beneath it, and the eggs are contained within the cavity. In the end the insect dies and her body forms a scale over the eggs. Later the eggs hatch, and the young leave the original scale and establish themselves on other parts of the host. The woolly material is exuded from the old scale as the young hatch. As a matter of fact, the specimens you sent were in the process of hatching, and the whole parcel was alive with hundreds of young lice, and our office table is covered with them at the time of writing. If you have cut away the affected branches, you should have removed the greater part of the pest, but it would be wise to spray the trees and walls with a solution of lime-sulphur 1-100. You do not say what winter wash was used, but you should continue to use a winter wash, and that wash should be a tar oil at 5 per cent. Drive this wash well under the branches of the trees growing on the wall.

Diseased Plum

(R. Dodgson).—Your Plum specimen sent for examination appears to be attacked by the die-back disease of fruit trees, which is caused by a fungus named Cytospora. The only control is to cut out and burn all the portions attacked. Spores are liberated in great numbers from all the dead tissue, and the disease soon becomes rampant. You will notice that in the attacked portions the wood is stained brown. This discoloration is due to the fungus running in the wood. All this brown stained wood must be cut away, and as this frequently runs into the main stem the destruction of the entire tree is often the only remedy. It appears to us that the land you are trying to grow the Plums on is badly drained, and, if so, this condition would make your Plums very easy victims of the fungus concerned. Drainage would greatly improve your land and the Plums. The only way to deal with Marestail is to drain the land and to hoe off the aerial portions so soon as they appear. Marestail is never troublesome on really well drained land.

VEGETABLES

Diseased Potatoes

(M. H.).—The piece of Potato sent for examination is insufficient for the purpose. If you can send us one or two complete tubers we should be pleased to examine them for you. The piece of tuber sent is so contaminated with bacteria and fungi that it is impossible to separate out any one organism as being responsible. It is possible that some cultural detail is at fault. Have you given any manures? If so, state the kind and quantity used.

Sowing Asparagus

(Miss Burt).—The seeds should remain on the plants until they are ripe, after which they should be gathered, spread out on a sunny shelf in the greenhouse, until quite dry. They are then stored in a dry but cool place until April, when they can either be sown where they are to remain permanently or else on well-prepared ground in another part of the garden, there to remain for a year or two to gather strength. The seeds are sown thinly in shallow drills, about 15 inches or 18 inches apart. To give full directions on the cultivation of Asparagus would take up far too much space, but we have seasonable articles on this, as on all other vegetables, in these pages; so you will get all necessary information if you keep an eye on the paper from week to week.

MISCELLANEOUS

Capsid Bugs

(A. H.).—There are many kinds of Capsid Bugs, and you do not state which Capsid you have in mind. The species found on Apples and Currants are Plesiocoris rugicollis, Lygus pabulinus, Psallus ambiguus, Orthotylus marginalis, Atractotomus mali, and Calocoris fulvomaculatus. Of these Plesiocoris rugicollis, the Apple Capsid, and Lygus pabulinus, the Currant Capsid, are most common, and serious damage is largely confined to these species. All species may be controlled by using a good nicotine wash early in May. The spray should be repeated if necessary.

Caterpillars

(S. W.).—If you spray your plants with quassia and nicotine you will render the plants distasteful to the caterpillars which the spraying does not hit direct. Those which are reached by the spray will be killed, and if you give the plants a second spraying in a week following the first application you should have them under control. Obtain the quassia and nicotine from a reliable house such as Messrs. Bentley and Sons, Barrow-on-Humber, Hull, or from Messrs. Willis Bros., Harpenden, Herts., both of whom will give printed instructions for its use.

Weed in lawn and grass turning brown

(Duffer).—The weed is the Common Yarrow (Achillea millefolium), which revels in poor, barren land. This weed will continue to trouble you until you have enriched the soil of that part of the lawn in which it is growing. A dressing of lawn sand applied towards the end of September, at the rate of 3 ozs. to each square yard, will kill a certain amount of it, and a further application in March will so encourage the grasses that the Yarrow will practically disappear. The real cure, however, rests with the soil, and if you require a good sward of grass which will not seriously brown during spells of drought, then you must proceed as follows :—Lift the turf from that part of the lawn showing distress and place on one side, then remove the soil to a depth of 6 inches to 9 inches, as this is useless for growing good grass. Now replace the latter with good top spit from a pasture, adding a little bonemeal as the filling in proceeds, make the whole firm by rolling, and relay the turf. This will effect a vast improvement and give you a lawn worthy of the name. Unfortunately, too many so-called lawns are made in the manner you describe, only to become a permanent nuisance to their possessor. Levelling a stretch of ground and making a lawn are very different matters. All turf should have at least 9 inches to 1 foot of good loam beneath it.

Cheshunt Compound

(K. Hely-Hutchinson).—Cheshunt Compound should be mixed to the proportion of 1 oz. to 2 gallons of water.

SHORT REPLY

M. B.—Emilia flammea is a half hardy annual, with showy orange-scarlet flowers. Statice Suworowii is also a half hardy annual.

NAMES OF PLANTS

A. R. Hallett.—The yellow flower is Alstromeria aurantiaca. The shrub is one of the Robinias, probably R. hispida (Rose Acacia). A flower is, however, ne
before naming with certainty.

S. H. B.—Physostegia virginicum.

Ernest Roshard, Rotherham.—1,

A BURNING QUESTION

Do not burn your garden refuse; it is wasteful. Ensure a supply of excellent organic manure by treating lawn mowings, leaves, weeds, and general vegetable refuse with ADCO. Results prove that Synthetic Farmyard Manure made by the ADCO PROCESS is the most effective substitute for animal dung. The manure shortage is a serious question, but

ADCO WILL ANSWER IT

ADCO and water added to refuse as it accumulates will produce a rich clean manure in from two to six months; thousands of tons are made annually by gardeners, farmers, fruit growers, nurserymen, schools, and institutions.

One cwt. of ADCO makes 2 to 3 Tons of Manure

ADCO ACCELERATOR

The "LEFCO" ANIMAL ORNAMEN
will be happy tenants of your garden.

"Lefco" Animals are made for the wanton, informal garden. As you stroll along the winding paths a glimpse is caught of a rabbit in a tangle of fern and flowers, so alert, so realistic that your dog makes for it with a joyous bark; to tumble to an amazed halt at the immobility of this fearless creature. The Owl broods with wise, unblinking eyes beside the lily-pool and the tortoise by the garden seat is symbolic of the unhurried dalliance a garden provokes.

All "Lefco" Garden Ornaments are imperishable. Made in a matt-glazed, brown-speckled biscuit fireclay, they neither rust, crumble nor corrode. Send for Free Booklet illustrating the complete range of over fifty "Lefco" Garden Ornaments, Bird Baths, Sundials, Vases, Fountains, etc., at prices that make it possible for everyone to beautify the garden.

me reader who has been suc-
h these gay flowers will tell
us how best to organise the jazz orchestra! And of all Tulips, to me the noblest is the old T. Gesneriana spathulata, by tradition carpeted with Forget-me-not, although blue does not go with flaming scarlet, and a white carpeter were better. Before we consider Daffodils, let us look at the Lachenalias. The Cape Cowslip is ideal as a pot plant, inasmuch as it forces easily and increases rapidly. The forms of L. pendula are amongst the earliest to flower, and the hybrid L. Boundii, raised by Mr. Bound, of Redhill, is in flower by Christmas, and bright red. The varieties raised by the Rev. J. Jacob from L. Nelsoni and others are very good; L. Siam is perhaps the best. A stock of any can be worked up rapidly.

In my case, if I go to the Daffodil Show it means I do not get any Daffodils at all because I invariably select those sold per bulb by the pound sterling, and compared with these incomparable flowers the cheaper varieties seem unprofitable. So I order a few of the well known forcing varieties, Glory of Noordwijk, Golden Spur, King Alfred, Van Waveren's Giant (rather dear, but a good pot plant), and my old favourite Van Sion. Irene Copeland I shall like when its price drops. Most of all I prize Venetia, which was given me by the generous raiser, Mr. Cranfield. Nearly all the small-flowered Narcissi lend themselves to pot culture, notably N. Bulbocodium, N. cyclamineus, N. triandrus, and their forms and hybrids. Of Freesias I prefer F. refracta Excelsior, cream with orange blotch, to the white form of F. refracta. Of the coloured Freesias Buttercup and, though still a little expensive, Wisteria are very good.

Venetia, a triandrus hybrid raised by Mr. W. B. Cranfield

With the exception of the ordinary form of I. reticulata and of I. tuberosa, bulbous Irises require individual attention if they are not to disappear. I. reticulata Cantab, unlike the type, seems to want a heavy soil. It does well and increases in my sister's garden at Cambridge. I. Danfordiæ I thought I had lost, but after many blank years two bulbs flowered this spring, doubtless seedlings. I. Vartani, white and blue, flowers well in pots and is early; I. Heldreichi, I. Tauri, I. Histrio, and I. Histrioides are all good for pot work, and can be established out-of-doors where they require watching.

There are one or two Colchicums which flower early, C. montana, small white blooms with black anthers, listed by Mrs. Dykes, C. hydrophyllum, with mauve flowers, a good doer, and C. luteum, only to be obtained by favour!

It is dinner time, and though beef and mutton are as tough as the mountains on which they live, the Cantaloupes, Peaches, Nectarines, Greengages—nothing approaches a good Reine Claude—golden Muscats and golden Pears are luscious and comforting. WILLIAM LAWRENCE.

The Royal Caledonian Horticultural Society

The Autumn Show of this Society will be held on September 11th and 12th In the Waverley Market, Edinburgh. In addition to increased cash prizes there is the John Phillips Memorial Challenge Trophy, valued at 60 guineas, presented by Mrs. Phillips in memory of her husband, who died in 1917 while President of the Scottish Horticultural As-

Mrs. Dykes' new white Tulip

The flowers, which are very fragrant, are cream white, slightly deeper at the base, and with yellow anthers

sociation, which is now incorporated with this Society. The trophy is for six bowls of Roses, not more than 12 blooms in each bowl, and not less than six varieties. In addition, there is the Thomson Challenge Trophy for Grapes, the first prize being the Challenge Trophy (to be won three times) and £5 in cash and a gold badge.

A special feature of this year's Show is the "Abol" Challenge Trophy for plant breeding. This 75-guinea Trophy is offered for the exhibit which demonstrates the greatest advancement since the war in any one family or kind of flower, fruit, vegetable, tree, shrub, or foliage plant. The trophy has previously been awarded to Harkness's Regal strain of Lupins and Hemsley's strain of Sidalceas. This is the principal Show in Scotland and is well supported by the trade. From the number of entries already received it is assured that the Show this year will be a record one. Prize schedules may be obtained from the Secretary of the Society, 4a, St. Andrew Square, Edinburgh.

The Wood Lilies (Trillium)

These have bloomed profusely beneath large Magnolias, which provide the light shade essential to the successful culture of the beautiful plants. Their stations were prepared some years ago by taking out the natural sticky soil to a depth of 18 inches, and this was made good with a lighter soil, peat, sand, and leafy material, in order to secure the most natural conditions possible. This treatment has been quite a success, the plants annually producing luxuriant foliage and flowers. Seen at their best amid semi-wild surroundings, the Trilliums (Trinity Flowers) owe their name to the threefold arrangement of their parts, leaves, sepals, and petals. They love the shady, moist conditions usually associated with thin woodland, but care should be taken that the roots of trees do not rob them severely. A generous top-dressing of leafy and sandy material should be given them each year to maintain and encourage vigorous growth. Once they becom
lished under these conditions, very li
ther attention is required. There a
a dozen wild kinds, some of which a
in Japan, through Northern Asia
Himalayas, but the majority inha
peaty forests of North America.

After the first year or two th
become more vigorous, and, as a
consequence, the flowers are improv
in size and depth of colour.

T. grandiflorum and its beautiful
var. (T. g. roseum) are, perhaps, t
and most easily grown of this ren
genus, often succeeding where oth

candid criticisms of the egregious n Mr. Blair's article last year have me" is abundantly clear from his e issue for August 17th. In this, is former "replies" to my critic- ole defence or refutation of my es in the utter evasion of the real d, far worse be it said, in the re- f a gross misstatement of my nd further letters on the subject. er, page 559, Mr. Blair repeats his ong attribution to me of a state- h I never made, or even suggested. *id* say, as I have had to remind e, was that most of the "faults ncies he mentioned were 'consti- nd not 'seasonal,' and in an alto- erent category from lack of colour . . ., etc., which soil, locality, or season may and do exaggerate and show up."

In his article of August 25th, 1928, Mr. Blair set out to discuss "seasonal" failings in some Roses he has. What he really did was to become utterly confused between "seasonal" and "constitutional" failings to such a degree as to make his opening paragraph or two a futile absurdity! It was upon this that I chiefly criticised him, and, amongst other examples, cited the case of the hanging of their heads by Geo. Dickson and Los Angeles, which habit he deplored in an article purporting to discuss the effects of the season! I asked Mr. Blair plain questions, such as "What had last season in particular to do with G. Dickson or Los Angeles hanging their heads?" and "Was this the first and only time these Roses had displayed this fault?" To not one of my questions has he ever replied. The fact is, and he evidently does not relish it, he cannot do so without acknowledging his error and confusion in his article.

Blue Comfrey, much beloved of bumble bees

I note that in order to alleviate his injured feelings at being in a hole Mr. Blair commits himself to a still further repetition of his misassertions! "It will be interesting to know," he says, "how it is possible to say that a Rose is either good or bad, let the season be what it likes!" His interest is easily satisfied! All he needs to learn is the difference between Los Angeles hanging its head every year and Betty Uprichard being variable in colour, between "constitutional" and "seasonal" failings!

Skipton, Yorks. J. R. K.

Dianthus Atkinsoni

This, as I recently saw it, is an exquisitely lovely plant, quite one of the aristocrats of a large, varied, and beautiful family. The silver-grey Carnation-like leaves are in lovely contrast with the large single rosy-crimson, almost scarlet, flowers, and a few plants will provide a feature rich in beauty and full of interest. This very fine and rather scarce hybrid will enjoy a position in full sunshine and a root-run of gritty loam. Another Pink of merit is Dianthus x Spark, a few inches in height, with green foliage and large single blossoms coloured a full, rich crimson. It is not as yet very plentiful, but when better known should be assured of more than an ordinary measure of popularity, as it is a "good doer" and free-flowering.

Dianthus barbatus magnificus is in reality a dwarf, compact Sweet William, carrying a profusion of small, double crimson flowers. It is, I believe, a true perennial, but my own experience is that a batch of cuttings rooted annually will give the best results. This is a first-rate plant for providing a drift of bright and vivid colour upon the rock garden, and like its ubiquitous relative, it grows and flowers freely in any ordinarily good soil. A soil not too rich is, perhaps, preferable for this interesting Dianthus. Cuttings root with great rapidity and much ease, so that a considerable stock is easily acquired. It is a pity that the old favourite, Napoleon III., is not more frequently encountered, but it was ever a rather difficult matter to maintain a stock of it; its tireless flowering militated against the production of growths suitable for cuttings, so that the brilliant double flowers carried upon the neat plants are not so often seen as one would like. I used to obtain a fair number of cuttings by assiduously removing the flower-buds from a plant or two, and even then a great proportion of the resultant growths "showed for flower" immediately.

Yet another hybrid Pink brought to my notice this summer is Dianthus x Chelsea, of upright growth, 6 inches or 7 inches high, the flowers a somewhat strident shade of rosy-red, with a suspicion of magenta. It is, however, a brilliant plant of free growth, and one easily capable of some fine colour effects in the rock garden, providing its neighbours are chosen with care.

RALPH E. ARNOLD.

Cirencester, Glos.

Mechanical cultivation

I regret that pressure of work in other directions has prevented my replying to the remarks of "A Scottish Gardener" on page 511 of the issue of "GARDENING ILLUSTRATED" for July 27th.

"A Scottish Gardener" states that "I fear he" (Jack) "cannot have read carefully the question raised by 'A. D. D. G.' My recollection is that specifically he desired information not for the commercial gardens to which 'Jack' refers, but for a private garden in order that the latter may 'pay its way.'" I fail to see any great distinction between a commercial garden and a private garden that is made to "pay its way." Surely a commercial one has to do that? I know that if a commercial garden does not pay its way the owner very soon goes out of business, and also that sometimes a gardener in a private place that is supposed to pay its way fails to achieve that object.

"A Scottish Gardener," of course, has not used mechanical cultivation sufficiently to test it, or he would not fail to see the need sometimes of going over the work twice. Going over the work twice allows the mechanical cultivator to go over the hard places twice, and after the second time over the whole area is cultivated evenly to the required depth.

May I with all seriousness assure the critic of mechanical cultivation that garden boys are using mechanical cultivators, and that it is customary, both in commercial gardens and in private gardens which do pay their way, to use the cheapest labour to do any given job, provided the said work is done efficiently.

Finally, I had no axe to grind. I have never sold a mechanical cultivator in my

The pool in the rock garden

Canterbury Bells in many colours

IN A COLCHESTER GARDEN

life, but my object was to pass on my experience of mechanical cultivators which seemed to differ somewhat to that of "A Scottish Gardener." JACK.

Yucca recurva

The noble Yucca which you figured (issue August 3rd, page 535) in fine flower, under the name of Yucca gloriosa, is in reality Y. recurva, as may be seen by the leaves, which reflex elegantly, which is not the case with the stiff, bayonet-like leaves of Yucca gloriosa. Moreover, Y. gloriosa is a late autumn flower. Yucca recurva is by far the best plant for most English gardens. It is the hardiest and also the freest in flower.

EDWARD H. WOODALL.

Scarborough.

Fritillaria imperialis

The praise bestowed on the Crown Imperials by Mr. H. Stevens (page 563) is well deserved. Their rapid development in the spring is always a delight and their fresh foliage and flowers are very welcome. It is indeed fortunate that the disagreeable smell of the bulb—very similar to that emitted by bruised leaves of some species of Codonopsis—is not noticeable in other parts of the plant.

The reason for the present note is that the writer's experience with Crown Imperials is very different, in some respects, from that of Mr. Stevens. The idea that they strongly object to being lifted and replanted frequently is a common one, but the fact that the bulb has a short period of complete dormancy, during which the flowering stem and all the roots decay, suggests that lifting may not be harmful if carried out at the right time. The practice adopted by the writer is to lift the bulbs annually as soon as the foliage has withered and to lay them out in a light, airy shed. The white skin rapidly assumes a bright purple colour, and after a few days the old stem may be pulled out of the bulb, bringing with it the few remaining dead roots, and thus leaving a circular hole through the bulb and not merely the cavity to which Mr. Stevens refers. The bulb is in no way injured by this treatment. Replanting must take place before new roots appear—the first or second week in August is an appropriate time—and providing the bulbs are well surrounded by sand, there should be no necessity to plant them on their sides. So treated, the flowering and rate of increase leave nothing to be desired. N. K. G.

Wisley, Surrey.

A Colchester garden

I ENCLOSE two photographs of my garden. The pool in the rock garden has been made by my gardener. It is 10 feet long and from 4½ feet to 5 feet wide, depth at one end 4 feet and 18 inches. It is surrounded by a bank on one side of various Ferns and Primroses and on the other side with Rhododendrons. The other picture is of Canterbury Bells, double or Cup-and-saucer. This bed, about 50 plants, was a beautiful show of colour, pale pink, salmon, white, pale cream, cream, mauve, pale mauve, and one plant in mauve almost black. These plants were grown by R. Rogers, gardener at Eastwell House, Colchester, and the seeds supplied from Sutton and Sons, Reading. MRS. DES BARRES.

Colchester.

Lilium philippinense formosanum Price's Variety

It is gratifying to find that this beautiful Lily has proved so generally hardy. Unfortunately, in the south it makes its growth too early, and may be injured by late frosts, but in the greater part of Scotland, where it has been tried, it does not suffer in this way, and is becoming more and more appreciated by those who have seen it. It may interest growers or would-be growers of this Lily to learn that it does very well in the south-west of Scotland, not only in mild places, such as Logan, but even in the Dumfriesshire hills some 350 feet above sea level. For three or four years I have observed a colony of Price's Variety of this Lily in the latter place, and it does not appear to have suffered at all, although it has been unprotected during even the past winter. It is exceedingly fine, growing from 2 feet to 3 feet high, and bearing large trumpet-shaped flowers with prettily reflexed tips, and shaded externally with crimson-brown. It has
also the merit of fragrance. It sh
planted about 6 inches deep and th
covered with sand. S. A

Saxifraga signata

pardalinum giganteum, a superior
orm in colour and stature

Lilium pardalinum giganteum, 9 feet tall, over-topping all else in the flower border

This Lily, which is much superior to the ordinary L. pardalinum, both in colour and stature, has but recently been commercially grown. It has been flourishing in a country home garden near Portland for 40 years, according to the family who have lived there during that time. They did not plant it, and do not know its origin. Dr. David Griffiths, senior horticulturist of the U.S. Bureau of Plant Industry, thinks it may contain blood of Lilium Humboldtii, being possibly a natural hybrid. The bulb grows to enormous size, retaining the rhizomatious character common to Bog Lilies.

Illustrative of the great vigour of this variety is the fact that when the old bulbs were dug, about five years ago, they were found to be approximately 3 feet deep, having sent up their spikes through that depth of soil annually. Apparently they had been gradually covered in the course of years by soil from an overhanging bank.

The natural range of Lilium pardalinum lies west of the Cascades and Sierras, as far north as the Umpqua Valley in Oregon, and southward to Monterey County, California.

CARLETON YEREX.

Tigard, Oregon, U.S.A.

Bulbs direct from Holland

The above phrase seems to lure many of our amateur growers into sending their orders to Holland instead of giving them to an English retailing firm. As a member of one of the latter, I would like to point out some of the reasons for giving the Englishman the first chance.

The matter of price is probably the first thing which tempts the buyer. I have carefully studied the lists of many retailing Dutch firms, and find that the best of these, who really cultivate a large area of land and are able to offer bulbs of their own growing, are little, if any, cheaper than progressive English firms.

There is another class of Dutch grower who floods us with bulb lists, whose prices are ridiculously low, but what kind of bulbs do these men send out? Answer, any kind of stuff they can pick up at sales, which may be true to name, but very often is not. I have seen bulbs sent from one of these firms. They were Hyacinths still in their babyhood which might have made saleable bulbs in another year or two, but as sent out were absolutely useless. The man who bought them brought flowers to show me, and the spikes had about three or four miserable blooms on them. He was so disgusted that he pulled them up and threw them on the rubbish heap!

Again, last year, a Dutch firm was advertising Tulips at very low rates. A Dutch friend of mine asked me to buy a few and test them. I did so. Results: Narcissus Victoria turned out to be princeps, and not very good. Some Polyanthus Narcissi were very poor; and of some seven varieties of bedding Tulips, not one was true to name, and most of them not even the same class of colour. Bright red for purple, white for pink, etc., was the order of the day! Further, we hear so much about Dutch bulbs that some get to think that every bulb in creation is grown to perfection in Holland; but this is not so. The Dutch are wonderful growers, and I would be the last to say otherwise, but their soil and climate are not suitable for all bulbous subjects. Freesias, Paper-white Narcissi, and many Lilies are grown in France and Japan, while Daffodils and May-flowering Tulips can be grown quite as well and even better on British soil. I claim, therefore, that the English retailer, having the pick of the whole of Holland, France, Guernsey, Japan, and England to select from, is in as good a position, or even better, to sell the best of bulbs as is any Dutchman. Again, have the people who send their orders "direct to Holland" ever thought how many trades are affected in addition to the bulb merchant? Boxmakers, bag and papermakers, spring makers, printers, and last, but not least, the British working man, are all losers by this rush to deal with the foreigner rather than the home firm.

I would, therefore, urge that the amateur who intends to send an order to Holland for his bulbs should, first, carefully consider if he is really going to benefit by doing so, and, secondly, how much good money he will be

Othonnopsis cheirifolia on stone wall at Munstead Wood

sending abroad which might be shared by his own countrymen in various walks of life.

Support home industries!

An English Grower and Retailer of Bulbs.

Polygonum campanulatum

In reply to A. M. D. H. Rogers, *re* Polygonum campanulatum (page 543), I am able to say that a plant growing on the top of the rock garden here came through the winter quite unharmed, and without protection.

Southwell, Notts. H. J.

Rock gardens at Chelsea

Mr. Wood's "short" reply to my recent letter seems to me to be an agglomeration of evasions, misunderstandings, and contradictions. He says I compare the "majestic" with the "pretty" style, and that a good critic must not compare instances of unlike styles. I do not accept the classification, and I say here and now that he is guilty of infringing his own dictum. In a previous letter he says of these same two styles: "I preferred the 'severity' and 'imitation' of the one to the flat and rather monotonous prettiness of the other." That is a rather good instance of Mr. Wood's controversial methods. Here is another.

He perverts my words to make it seem that I took the opinion on this matter of "lesser lights" only, and suggests that I was too much afraid of what their answer would be to seek that of "greater lights." My actual words were "verdicts from leading exhibitors, lesser lights, and private persons"—three distinct categories, thus ensuring a fairly representative consensus of opinion. I suggest that my opponent should at least do me the justice of reading my letters carefully before answering them.

I have to thank Mr. Wood for his lesson in the technique of painting. I confess quite freely that in common with most other exponents of rock work I know little or nothing of that branch of art, and less of the technical terms used. I confess, too, that because of that I did misunderstand Mr. Wood's use of "flat." But I fail to see that a knowledge of technical terms is necessary to a right appreciation of art. Even with Mr. Wood's elucidation of the term, I cannot agree that De Smet's work was "flat."

Further, Mr. Wood knows, as well as I do, that, as my photograph of the show will make plain, the viewpoint at Chelsea is strictly limited. What with crowds of people and crowded exhibits, one has at most times to stand right in front of a garden before one can obtain a good view of it. A distant view is more or less of an impossibility.

To conclude, I admit the charge of youth, and glory in it. Mr. De Smet is about my own age, and has already won for his work a silver-gilt and two gold medals, a silver cup, and the Sherwood Cup. Of course, Mr. Wood's notable contempt for awards will enable him to overlook this otherwise clear testimony to the value of De Smet's work.

Taplow. P. Penrose.

Exhibition Gladioli

I most cordially agree with "H." (page 574) in his outspoken criticism of the Gladioli which came under his notice at the "fortnightly" of the Royal Horticultural Society. Although I did not see the exhibits, I have not the least difficulty in visualising them in my mind's eye—I am too familiar with these heavy and over-grown spikes. Size—size—size. Such appears to be the aim of exhibitors of Gladioli, not only at the R.H.S. show but at every little village exhibition. For real beauty the Primulinus section is far and away superior to the florid bloom and the stiff spikes of the florist's (or exhibitor's) Gladiolus. No doubt "H." will suffer for his temerity, but he is right. I envy him his droll gift of description: "A bunch of Gladiolus primulinus type, which looked like the timid author of a successful musical comedy taking his call in the middle of an exuberant beauty chorus." "H.," in addition to his gift of shrewd criticism, has also the gift of humour. More power to him.

A Scottish Gardener.

Asarum europæum

I was interested in a note in a recent issue in connection with this little-known plant. The writer tells us that this Asarum is useful for dry situations. No doubt it is;
also found it very useful indeed in dam
semi-boggy, places in which nothing el
satisfactory. The leaves, to some exte
semble those of the Cyclamen—they a
dark green colour and very glossy.

Wood Gardens, Basingstoke.

Begonia Gloire de Lorraine and its different forms

Few plants have attained such a hold on popular favour as Begonia Gloire de Lorraine, for it is still largely grown both in private gardens and in nurseries where flowering plants of a decorative character are cultivated, while the amateur with but a single glass structure finds it equally useful, supplying as it does a bit of bright colour in early winter. It was raised by M. Lemoine, of Nancy, in 1891, and distributed two years later. The parents were B. socotrana (which has since given us many beautiful winter-flowering hybrids) and B. Dregei, an old species native of South Africa. It is questionable if the raiser ever anticipated the great popularity that B. Gloire de Lorraine would attain; indeed, it was, I believe, very scarce in France till one or two of our large market growers took it in hand and turned out model little specimens full of flower, which gained the admiration of everyone. From that time its culture extended, till now there is no other variety of Begonia grown to anything like the same extent as this is. The typical form, with its bright rosy-pink blossoms, remained for some time the only representative of this section, till in 1889 two sports therefrom were brought before the public. They were Mrs. Leopold de Rothschild and Caledonia. The first-named is a good deal in the way of the type, but differs therefrom in its rather more compact habit and larger flowers, but particularly in its colour, which is of a clear pink, and affords a pleasing variety to the commoner kind.

Caledonia was, when first distributed, spoken of as a pure white Gloire de Lorraine, but the older flowers are tinged on the exterior with a dull pink, a shade that finds favour with very few people, hence it never became popular, for it proved to be a weak, unsatisfactory grower and very liable to die off. This objection cannot, however, be urged against the later sport, Turnford Hall, which was first shown at a meeting of the Royal Horticultural Society in October, 1901. It differs from the typical Gloire de Lorraine in being more vigorous, and with somewhat larger blossoms, which are in colour white, tinged with rose.

Cultivation.—The culture of the Gloire de Lorraine race of Begonias is not at all exacting, the principal difficulty being to obtain good cuttings in the spring, as the plant is so free-flowering that it will continue to bloom instead of growing, and it is useless to propagate from cuttings of the flowering shoots, as they will not branch out, but continue to produce blossoms. The best cuttings are obtained from old plants that have done flowering, and if they are shortened back about February they will in time push out young shoots from the base. When these shoots are from $1\frac{1}{2}$ inches to 2 inches long they make the best of cuttings, particularly if taken off close to the old stem. Put into well-drained pots of light, sandy soil, pressed down only moderately firm, they will soon root if placed in a close propagating case in a gentle heat. Care must be taken not to over-water, otherwise the cuttings are liable to damp off. Directly they are rooted more air must be given, and though the young plants succeed best in a gentle heat early in the year, later on they may be grown in a greenhouse or frame, though when the nights get cold in autumn a little heat is again necessary. A mixture of loam and leaf-mould, with a sprinkling of sand, will suit this Begonia, but when the pots get full of roots an occasional dose of liquid manure is of great service.

White-fruited Billardiera fruticosa

We have long been acquainted with the beautiful dark blue fruits of B. longiflora from Tasmania, and now, thanks to a friend, I have a fine plant of the white-fruited kind, which in its way is equally attractive. As the blue-fruited kind is liable to get touched with frost during severe weather, I decided to grow the white one in a large jar, keeping it in a cool house during the winter and until part of its fruits had set, when it was stood out in the open. This has proved very successful, the plant having set a large quantity of handsome white fruits which are slightly stained with blue. The plant is about 3 feet in height and 2 feet through, the fruits being suspended in an airy and very beautiful manner.

A window box at Walworth and a back garden near Southwark Bridge

Gardening in the East End

We publish this article with the express object of calling attention to the good work done by the London Children's Gardens Fund. The Secretary is Lady Lyons, 4, Adelaide Mansions, Queen's Gate, S.W. 7

Cinders and brickbats, gravel and soot!
Poor soil for gardening, do you say?
Not a bit of it! Come along to the East End and see how we do it.
Your chauffeur won't mind? I'll show him the way.

" Commercial Road. The name seems familiar. Oh, yes! Thomas Burke, ' Limehouse Nights,' etc. Yes! It's always rather crowded in the day time. Horse traffic, you see."

We creep past the shops.

Apfelbaum — Krilowsky — Screzeny — Bluthmann—Abrahamovitch . . . .

" Oh to be in England! "

" First to the left—now right—we'll stop here; you can't turn at the bottom."

A passage dives under the houses and we mount the steps to a solid and well-locked door.

A knock brings the lady guardian who inspires and directs this hallowed acre.

" The children will be here soon; they spend most of the evening here. There's nowhere else for them to play, except in the streets."

Small, grave-like plots extend over the whole area and are edged around with bricks set at an angle to give a serrated edging, and in each a small peg proclaims the owner's name. Vegetables, of course, come first: Onions, Spinach, Lettuce, Parsnips, and Radishes, of course, their quick maturity endearing them to youthful gardeners.

Turnips—here they are. No signs of flea; strong vigorous leaves!

" No manure except soot, which costs us nothing."

" Our worst pests are thieves and cats—live cats, that is. Our local knowledge enables us to return the dead ones."

And after the vegetables—the Marigolds. Marigolds everywhere lifting their courageous gold above the grime.

Virginian Stock fills the borders with its cheery stars. Runner beans mount the walls hopefully, giving a welcome note of colour.

A rush of feet and a sound of shrill voices. Through the gate they come, clean and dirty, small and smaller, elder sisters, grave with the responsibility of families.

Like exhibitors at the country show when judging is done, they spread out and rush, each to his own plot.

Has that Marigold bud opened yet?

Will those Radishes have attained a size which will gain consent for their gathering?

All gardeners know this dear, familiar thrill after a short absence!

Then to watering! Now this is what we really like. From the shed we take our numbered cans and join the queue at the water tap. And when we water, we do it well.

Not merely is the dry earth well soaked, but each leaf must glisten with refreshing drops and take on a richer green for our trouble. And then the paths, too! Why should they be dry and dusty? Back to the tap again!

But we must leave the busy clamour; there is our newest plot to be seen. You will then know with what sort of material we start.

And so, to the streets again. Past the small two-storied houses which stretch interminably, it seem, on right and left. We turn down a side street, and, after an amicable discussion as to priority with a lorry driver in a narrow turning, we stop at a newly-fenced corner site—" our recreation ground " —soon to be a garden.

A wilderness of bricks and rubble, all that
was not worth taking away after t
struction of buildings which, for perh
century or more, have kept the light
Mother Earth.

Poor, starved soil, what can we
from you after these years; a cent
darkness and neglect?

" Remove the bricks," says Mother
" dig me over, and in a year I shal
regained my fertility."

And so the incredible happens, witho
well-rotted manure and humus whic
spoiled countrymen consider indispe
this marvellous regeneration begins.

Though on this present plot, starte
in the spring, there are but six newly-p
Marigolds, drooping to earth in the
heat, yet these are enough to encoura
army of eager enthusiasts. Spades and
are wielded with fury, water-cans con
to lay the dust, and those weaker br
whose faith does not carry them to the
of next year's hope, may build the hou
their dreams in a secluded corner.

Such is the good work of the London
dren's Gardens and Recreation Fund,
limited income is spent in rent, rates
expenses of the garden supervisors.

More power to their civilising efforts
we hope that in the clearing of the
now proceeding a thought will be gi
such gardens. Let us not give up to a
the entire playing spaces, but prese
small area of open soil for such activ
enthusiastic gardeners.

But our time is up, and we make f
car which now stands with its bonnet
westward, and a visible hope of deliv
on the chauffeur's face.

As we pass the gate we are stopped.
is it? Something we have missed?

Towards us comes an elder sister su
ing a small and rather grubby young
man whose newly-acquired art of w
has not yet the finish which comes f
year's practice.

With the grim concentration, chara
tic of his years, he clutches an old t

doing them harm. Early autumn is
planting season for the dry roots,
time should now be lost in conclud-
important work. The following are
nore deserving of general cultiva-

RENAICA.—If of a rather dull purple
colour externally, there is an elegant
about this good hardy kind, and the
is relieved by the beauty of the inside
lower. The perianth, too, is finely
at the mouth, and this, in greater
reveals the fine reticulations within.
nt grows 15 inches high, and some
inches through at base, in a stony
r well-drained soil, have remained
ears without disturbance. The in-
not rapid, but steady. Pyrenees.

CURVA.—A well-grown spike of this
e or well-nigh unique species is hard
to beat. Unique in rich scarlet of the perianth, which is finely recurved at the point of the segments, it is also remarkable for the minor markings of yellow with which it is endowed. Rising to 12 inches, and sometimes as many as 18 inches, the spikes will bear three, or possibly three times this number, of its lovely flowers. It is a Californian species, and, therefore, delights in a warm position. At the same time a good depth of soil should be given it, and a soil mixture of peat, loam, and leaf-soil about equally, with a liberal addition of sharp sand. As a pot plant, or a plant to grow among rare things whose hardiness may leave room for doubt, this has much to commend it. In the open only the sunniest spot should be given it.

F. VERTICILLATA THUNBERGI, from China and Japan, is a neat plant whose long, narrow lineal leaves, each of which terminates with a recurved-like tendril, always attracts attention. The solitary pendent bell-shaped flowers are mottled with pale purple on a greenish ground.

F. WALUJEWI.—A handsome species from Central Asia, the exterior of the perianth silvery-grey and internally nearly blood-red. The flowers are large and handsome, and the colour distinct and good. It is not lacking either in beauty or novelty of colouring. The plant is about 1 foot high.

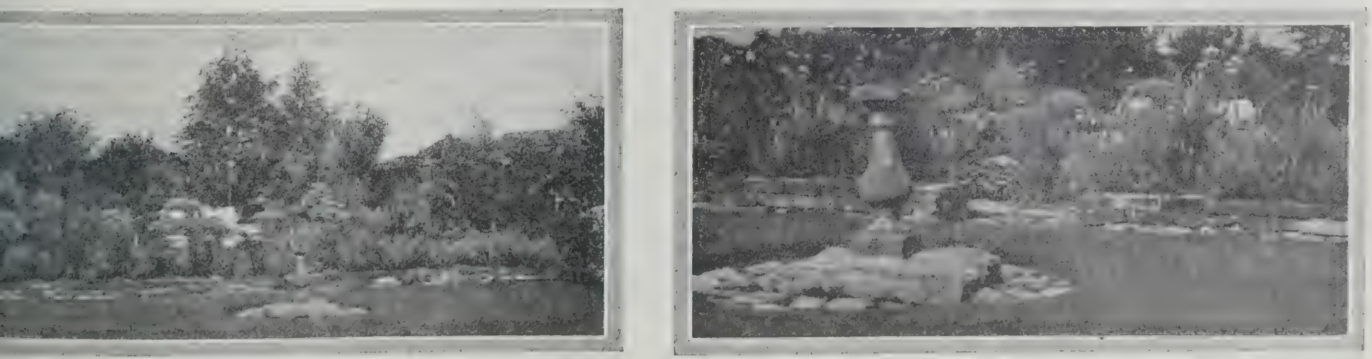
F. WHITTALLI is a beautiful kind worthy of association with the last-named. Its flowers are beautifully tesselated, both inside and outside, with reddish-crimson on a greenish yellow ground.

The above by no means exhaust the list of the curious and beautiful forms of this genus, but a pleasing selection may be obtained therefrom, giving flowers for quite a lengthened period in the spring months of the year.

Scabiosa pterocephala

This charming little plant is a native of Greece. It is a dwarf, tufted perennial, and a most desirable and worthy subject, well adapted for growing in the rock garden, dry wall, or even in the flower border; it may also be employed successfully as an edging plant in some situations where conditions prevail necessitating the use of a rather uncommon plant which possesses the characteristic qualities of being both neat and ornamental. Undoubtedly a good place for this plant is a sunny wall, or a warm position on rock work, growing the plants in groups with a view to producing a massed effect. It is an ideal subject for growing in association with other grey foliage plants, such as Achillea umbellata, Artemisia sericea, Nepeta Mussini, dwarf Lavender, Santolina incana, the Lavender Cotton, and others. The plant forms a dense mass of somewhat greyish foliage which in summer is surmounted by numerous fairly large mauve-purple flower-heads from 1 inch to 1½ inches in diameter, supported on short, stout stems about 3 inches to 4 inches long. Although a comparatively easy plant to cultivate in ordinary garden soil, it succeeds best in a light, warm soil in an open, sunny position. This plant is also known and goes occasionally under the name of Pterocephalus parnassi.

J. L.



vell-planned London back garden, with lawn, sundial, low stone wall, and rock garden. Nepeta Messini, Lavatera, and Antirrhinums make a fine show in this garden

THE CHEDDAR GORGE

This fine view is worthy of careful study. It has been an inspiration to the builders of rock gardens on bold and natural lines

Delphinium Cultivation

THE Delphinium is every year being more grown, and some amazing effects are to be seen in a variety of positions; in fact, there is no part of the garden where the plant is out of place. When we come to the question of its culture the first point to be considered is the preparation of the soil. The Delphinium in this respect displays a truly wonderful adaptability, for it will thrive just as well on heavy soil as on a light and warm one, provided it is well prepared and planting carried out at the best time. There are two distinct periods for planting, according to the nature of the soil. The month of September is the best time for planting on light, warm soils, as the roots then get a good hold in their new position and fine spikes are secured the first season after planting. To plant at such a time upon a cold, heavy soil would spell disaster, and the end of March or early April is the best time. At this period there is a gradual but steady warming of the soil, which provides just the conditions for the plants to re-establish themselves, even though there is something lost in stature and quality of the flowers the first year.

To plant a Delphinium properly entails as much care as does a choice Rose or fruit tree, therefore a really large hole should be taken out so that the roots may be spread out to their full length. There must be deep digging of the soil, at the same time working in a generous supply of good, well-decayed manure, for the clumps will not be disturbed again for some years. Directly planting is finished cover the crowns with sharp sand or ashes, or the slugs and snails will soon commit havoc with the young shoots, which they regard as a great dainty. If their attacks are not frustrated the plants will be absolutely ruined. Those who have an eye for the exhibition stage will require extra large spikes, therefore there must be thinning out of the stems in early spring to three or four of the strongest on each plant, and during the time the flower-spikes are growing there must be generous supplies of liquid-manure. The bearing of seed makes a very great demand on the roots, therefore unless these are really required the faded flower-spikes should be removed directly they are past their best. If the plants are cut down to within 6 inches of the ground immediately the first spikes are faded a second flowering is obtained in autumn. This treatment means the starting of the dormant eyes at the base, and growth quickly follows. The fact must not be lost sight of, however, that this practice places a great strain on the plants, and in the long-run will tell, no matter how you may try to compensate by extra supplies of food. The raising of plants from seed is a most interesting method of increasing one's collection, but it is as well to remember that the plant is so sportive that very few of the seedlings will bear any resemblance to the parents. A border or bed should be devoted to them for their first flowering—which is about 15 months after sowing—so that all the inferior ones are weeded out and only the very best retained for the garden borders. Choice named varieties are propagated by division, which requires care. The best plan I have found is to cut the plants down to within 6 inches of the soil when flowering is over, and then to pile over the crowns some light, rich soil about 18 inches high. The dormant buds start up from the base, and the growths coming up through the mound of soil emit roots on their way, and so division is greatly facilitated. Named varieties are literally legion, and some are very expensive, but in the following list I shall only name good forms which may be recommended with every confidence and can be obtained at a
moderate price:—Eva, pale blue,

ter than usual with me. Farrer tells
t is a dwarf G. septemfida, and one
lisposed to dispute his opinion, at
ing the point of view of a gardener.
It has much the same habit as that valuable Gentian, with the advantage for the small rock garden of a dwarfer and neater habit. It has the same deep blue flowers, and at this season its flowers are highly acceptable. To add to this, it is exceedingly easy to grow. It is thriving well here in rather heavy loam and sand and on a level at the base of the rock garden. It does not appear to have any penchant for peat, leaf-soil, or lime.

S. ARNOTT.

Polygonum affine

A pretty, dwarf species from the Himalayas, P. affine is a most interesting and useful plant, providing a beautiful touch of colour from late summer onwards throughout autumn, and in favourable seasons well into the winter. The rosy-red flowers are produced in dense spikes on erect stems less than a foot high with the greatest freedom. These flowers rise from a dense mass of rich foliage, aptly described by one writer as lamb-tail-shaped, soft as down, and smell like heather. During the summer and early autumn the leaves are a pleasing bright green, which later in the season turn to a rich brick-red, and being persistent, the plant continues to be ornamental until the winter is well advanced. It is a rampant grower, with a natural creeping habit, rooting as it goes. On this account it is as well to plant it in a position where it can grow unrestricted without encroaching on other dwarf and less robust subjects. It is an easy plant to cultivate, and may be grown in any kind of soil, and almost any position, but it delights in a situation exposed to full sunshine. For growing on shelving portions on the upper parts of rock work, where the clumps can spread and overhang, it forms an ideal subject, with its fine flowers and beautiful lasting autumnal tints.

J. L.

The Loosestrifes (Lysimachia)

The value of the Loosestrifes is considerable, especially in damp places, such as by the side of a pond or stream. They vary much in height and appearance, from the tall, 3 feet L. vulgaris to the old plant known to many as the Moneywort, or Creeping Jenny (L. Nummularia).

A handsome June and July flower is L. barystachys, with spikes, some 18 inches high, of waving white Veronica-like flowers. L. clethroides is of about the same height and has curling spikes of white flowers. It is rather bolder than the foregoing, and is a good border plant for the same season. L. dahurica, 2 feet high, with sulphur-yellow flowers in pyramidal spikes, is a rare species of considerable beauty in summer, when it blooms. A little known Loosestrife, L. Henryi, which hails from China, is about 9 inches high, and is a welcome addition to the yellow species. It is suited to the damper parts of the rock garden or the border, and has clusters of good-sized yellow flowers in summer. L. Fortunei, 2 feet or so high, has drooping spikes of white in August and September. The fact of its foliage assuming a scarlet tint in autumn gives it additional value. It is almost unnecessary to say anything about L. Nummularia, the Moneywort, or Creeping Jenny, an old and popular trailing plant with rounded leaves and yellow flowers. The variety aurea has charming yellow foliage. That called minor is a miniature of the type, both leaves and flowers being only about half the size of those of the type. L. thyrsiflora, with close, small yellow flowers, is not one we care much for. It is 2 feet high and flowers in May and June. L. velutina, yellow, 2 feet high, blooming in summer, and the tall yellow L. vulgaris, flowering in July, are both suitable for the wild garden.

Roses from cuttings

Many of the climbing and rambling Roses, and also a few of the dwarfs, succeed admirably on their own roots. The present time is very suitable for securing cuttings. Shoots of moderate strength, secured with a " heel," are most certain to root. They may be inserted in pots of very sandy compost and set in a cold frame or else in a sheltered corner out-of-doors. In the latter case, see that the soil is pressed very firmly round each. When the cuttings are planted in the open it is necessary to insert a much larger number, as the percentage that will root is sometimes not very high.

Gentiana septemfida flowering in the corner of an old stone trough in a small enclosed garden

This good-natured Gentian is free flowering and the most amenable to cultivation

REMINDERS FOR THE WEEK

Southern and Midland

Begonia Gloire de Lorraine

The time has arrived for the final potting of this fine winter-flowering plant, a few of the strongest being selected to form extra large specimens. The compost should consist of three parts fine turfy loam, with the remainder made up of leaf-mould, a little peat and sand, and a little bone-meal. Pot moderately firm and take the utmost care to see that drainage is good. Continue to grow on in a brisk temperature, removing all flowers as they appear, and applying light stakes if necessary.

Gloxinias, Achimenes

These and similar subjects should, as they pass out of flower, be transferred to cool frames. Water, however, must be given as required until the plants develop signs of their foliage ripening, when it must be gradually withheld.

Cyclamens

Cyclamens now making robust growth should be assisted with an occasional weak stimulant and free syringing among their foliage following hot days. On no account should their foliage be allowed to wilt as the result of exposing them to hot sunshine and dry conditions.

Pelargoniums

Those prepared for blooming indoors during the winter months should now be housed, either in a cool greenhouse or frame to which air may be freely admitted. A little soot-water applied from time to time will improve both the health and colour of the plants.

Schizanthus, Mignonette, and Clarkia

Make a further sowing of these annual flowers for blooming in the New Year. The most satisfactory method is that of sowing about five or six seeds in a 3-inch pot and reducing them later to the required number before potting on into larger sizes. In the case of Mignonette it is, perhaps, preferable to sow direct into 5-inch and 6-inch pots filled with a good, rich, open compost. As Mignonette does not transplant well, the seeds should be raised in a cool frame.

Chrysanthemums

Pay strict attention to the stopping, disbudding, and tying, and do not fail to syringe the plants vigorously once daily. Should the weather continue hot and dry, the final result will depend to a large extent upon present treatment, therefore feed the plants twice weekly in order that a fine, strong and clean, but not coarse, growth may be developed.

Grapes

The later varieties are now colouring, and this colouring will improve if a little sulphate of iron is added to the water occasionally. Air should be freely given when the outside temperature admits of this being done, although it would be unwise to allow the thermometer to drop below 60 degs. until the Grapes are three parts coloured, as a sudden fall in temperature will cause shanking to set in.

Melons, Cucumbers, and Tomatoes

These are all carrying heavy crops and should be fed liberally. The temperature in Melon houses should not fall below 65 degs., and ripening fruits must be removed when three parts coloured and smelling freely. Gather the Cucumbers daily, also Tomatoes as they colour, and thus throw the whole strength of the plants into oncoming fruits. Too much moisture, coupled with low temperatures, will cause splitting among ripening Tomatoes and Melons.

Strawberries

Remove the newly-rooted runners from the parent plants and place them in rows close together, preferably on a bed of ashes, until required for potting on in readiness for forcing or for planting in the open. Water freely, and do not overlook the requirements of the old plants in this respect, otherwise they will exhibit signs of distress.

Early Pears and Apples

Generally best when gathered direct from the trees for the table are these fruits, but as this is not always possible, remove a few fruits each day a little in advance of ripening and allow them to finish in a cool, clean storeroom.

Corn Salad

A sowing must now be made, either in shallow drills at 9 inches apart or broadcast in 4-feet wide beds so that it may be conveniently cut during the winter months. A last sowing of Spinach should also be made.

Autumn sown annuals

Ground in readiness for these must now be prepared and should be sown before the 15th of the month. Over-rich ground is neither necessary nor desirable, providing it is of fair substance. Many and varied are the beautiful things at our disposal, and all should be sown thinly, and, for picturesque effects, broadcast. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Figs under glass

Any fruits that show now should be immediately rubbed off, as they have not the slightest chance of developing. In houses where the fruits are ripening, a dry, buoyant atmosphere should be maintained. Plants in pots that may require a shift into a larger size should now have attention. A very moderate shift should be given, however, so as not to encourage too rampant growth.

Orchard-house trees

Any re-potting necessary should be carried out before the leaves fall, the presence of these being a great aid to the roots in taking possession of the new compost. This should consist mainly of the best, fresh, fibrous loam, and used in a rough state, especially for the "stone" fruits. The addition of a good quantity of mortar rubbish from an old building is very desirable. Bone-meal, too, can be freely used, but animal manures should be avoided. Ram the soil very firmly and afterwards give water with great care.

Late Melons

Much care is necessary with the late batch, especially in the way of watering, for any carelessness in this respect will almost certainly be followed by canker at the necks of the plants. Water should not be allowed to touch the stems near the ground, and yet the roots must not suffer from dryness. Maintain a fairly high temperature or the quality of the fruits will suffer.

Tomatoes

It is a mistake to keep the house close shut at any time while this crop is ripening, for it is almost certain that such treatment will cause numbers of the fruits to drop before they are anything like ripe. A gentle warmth in the pipes and plenty of air will, as a rule, ensure perfect ripening, and course, good flavour.

Propagating Pelargoniums

This dry season has been favourable to old-fashioned, yet useful, subject, and t is likely to be a considerable increase in number of plants raised this autumn. earlier now that cuttings can be secured better is likely to be the percentage that root. Set the pots or boxes in full sunsh but provide something for placing over t during heavy rains.

Other tender plants

All the more tender plants used in sum bedding that are raised by means of cutt should be propagated now. These shoul inserted firmly in boxes of very sandy set in a cold frame, and carefully sh from the sun for a few weeks. While soil must never get really dry, too freq applications of water will do even more h than dryness.

Pentstemons

Very shortly full stocks of cutting these must be secured, and in the mean every available shoot suitable for the pur should be taken of any scarce or espec fine variety, as by so doing the plants be induced to throw out other fresh gro that may later also be secured. While cuttings, if well cared for, will succee placed in boxes, best results are usually when a bed of sweet, sandy compost is n up for them under a cold frame.

Pansies and Violas

Cuttings of these are to be very scarc many gardens this autumn owing to the longed drought of the summer. It be well, therefore, to start at once and all the available cuttings, which will the plants to produce further growths t or four weeks hence,

Nepeta Mussini

This is one of the indispensable sum flowering plants nowadays. Plants always at their best the second year, an it is a good plan to raise a number of ones each year. Cuttings taken within next two or three weeks root freely quickly if inserted in boxes of sandy com and set in a cold frame. One-year-old pl are seldom killed in winter, whereas o specimens are frequently wiped out, o best considerably damaged, damp b apparently their chief enemy.

Strawberries

In many of our northern districts it is possible to have well-rooted "runne ready in time for autumn planting, so only thing to do is carefully to lift t "runners" which are well rooted before middle of September and lay them in clo together on a nice sunny border, transfer them to their permanent quarters in M or early April. In this way, of course fruit should be allowed the first year, fine plants will be built up for future c ping.

Feeding Chrysanthemums

The pots are now quite full of roots judicious feeding of the plants is desir "Little and often" is always the safe in the end the most satisfactory met Soot-water, liquid made from sheep or c droppings, and Ichthemic Guano are all g and may be used on alternate weeks. C results are had and much labour saved using Thomson's Top-dressing Manure.

The best six distinct sorts of Sweet Peas were put up by Mr. S. J. Haycocks, Wrexham, who showed Magnet, Powerscourt, Gorgeous, Royal Mauve, Jessie, and Mrs. Searles; second, Mr. A. Smith, Crewe.

From Gardening Illustrated

Fifty Years Ago

A cure for rheumatism

NUMEROUS cures of rheumatism by the use of Celery have recently been announced in English papers, but the following, more in detail, is given on the authority of the *New York Times:* "New discoveries or what claim to be discoveries—of the healing virtues of plants are continually making. One of the latest is that Celery is a cure for rheumatism; indeed, it is asserted that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is always put on the table raw prevents its therapeutic powers from becoming known. The Celery should be cut into bits, boiled in water until soft, and the water drunk by the patient. Put new milk, with a little flour and nutmeg, into a saucepan with the boiled Celery, serve it warm with pieces of toast, eat it with Potatoes, and the painful ailment will soon yield. Such is the declaration of a physician who has again and again tried the experiment and with uniform success. He adds that cold and damp never produce, but develop the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism nor gout. . . . Smallpox, so much dreaded, is not half so destructive as rheumatism, which, it is maintained by many physicians, can be prevented by obeying Nature's laws in diet. But if you have incurred it, boiled Celery is pronounced unhesitatingly to be a specific."—*August 30th, 1879.*

Perpetual-flowering Carnations were well represented. Mr. C. Engelmann had the field to himself in the class for a collection staged on the ground, in a space of 18 feet by 5 feet, with a first prize of £25. Mr. Engelmann was at his best, which means that the exhibit was as near perfection as possible. Altogether he put up 3,000 blooms in 75 varieties, which shows how comprehensive the collection was. The apricot-coloured Madge was shown in grand form. There was better competition in the class for a group 10 feet by 5 feet, in which Mr. Chas. Wall, Bath, was first, Messrs. Stuart Low and Co. second, and Mr. William Chandler, Rolvenden, third.

The best group of hardy herbaceous flowers was staged by Mr. H. Clarke, Taunton, a local exhibitor, Mr. E. J. Bayley, Shrewsbury, being second, and Mr. J. R. Sands, Wem, third. Mr. Clarke had excellent Zinnias, fine Clarkias, beautiful Larkspurs, choice Lavatera rosea splendens, and other showy border flowers.

Grand Phloxes were shown by Mr. A. D. Pitcairn-Campbell, Bangor-on-Dee, in a class for 12 varieties. The heads of blooms were of very large size and the individual pips equally substantial; indeed, they were some of the finest Phloxes we have seen for several seasons. His sorts included Aviator Bleriot, Ethel Prichard, Olive P. Campbell, Ian Pitcairn-Campbell, G. R. Stronlein, Deedside, and Saladin.

The 15 guinea trophy and money prize of £25 for a collection of herbaceous plants, flowers, foliage, etc., arranged in a space of 25 square feet, was won by Messrs. Bees, Ltd.

There was a new class for a miniature rock garden arranged on tabling 8 feet by 3 feet in which the three prizes amounted to £32, the first being £15. The judges awarded the premier prize to Mr. T. R. Hayes, Ambleside, who made the most of the small space by piling the rock work at the back and making it fall naturally to the foreground; second, Messrs. Maurice Prichard and Sons, Ltd.; third, Messrs. Bakers.

The standard in all the other flower classes was high generally. Limitations of space prevent reference to them in detail.

Shrewsbury has always attracted the best fruit-growers, and whilst we think indoor fruits have been shown better at some previous exhibitions, there were, nevertheless, many collections of great merit. The decorated fruit tables were, as usual, a feature of the show, and the high value of the prizes make it worth while to compete, for in addition to a trophy valued at 15 guineas, the first prize in money was £30 and the second £25, there being four prizes in all. Chief honours fell to the Earl of Rosebery, Leighton Buzzard, who showed, amongst other fruits, splendid Sea Eagle and Gros Mignonne Peaches, Humboldt and Pineapple Nectarines, Brown Turkey Figs, Muscat of Alexandria and Chasselas Napoleon Grapes, Melon Universal, and Souvenir du Congres Pears; second, Lady Kathleen Curzon Herrick, Loughborough; third, Lord Belper.

Mr. R. J. Corbett, Towyn, was first in the class for 12 bunches of Grapes in four or more varieties, with Messrs. J. Webber and Son second. The "GARDENING ILLUSTRATED" Medal, offered for four bunches of Grapes, two of black and two of white sorts, was won by Lord Swathling (gardener, Mr. F. J. Rose), who also showed the best two bunches of Madresfield Court.

The vegetables, as already stated, were splendid throughout. Seed firms offered valuable money prizes for collections of nine kinds, and some of the exhibits in these classes reached the highest exhibition standard. First prizes were won as follows:—Sutton and Sons' class, Lord Riddell (gardener, Mr. A. Payne); James Carter and Co.'s, Mr. T. M. Jones, Llandilo; Clibrans, Ltd., class, Mr. W. Robinson, Garstang; Dickson and Robinson's class, Mrs. F. Emmott, Lancaster; Messrs. John Peed and Sons' class, Mr. Jno. Evans, Llandilo.

In the Society's class for a collection of 12 distinct kinds, Messrs. J. Jones and Son, Ammanford, were the winners of the first prize with Ailsa Craig Onions, V.C. Peas, Prizewinner Beans, Summer Delicacy Cucumbers, Student Parsnips, Acquisition Leeks, Superb Pink Celery, and Scarlet Intermediate Carrots.

Whilst the competitive classes to which we have referred briefly were of great interest and importance, the non-competitive displays also helped largely to make the show such a success. The President, Sir George Holcroft, Bart., offered a special trophy, valued at £25, for the finest exhibit in the show. With Mr. Edwin Beckett, V.M.H., exhibiting one of his unsurpassable collections of vegetables, no one was surprised to find that the judges had singled this out for the honour, especially as it was Beckett at his best. Quite near was another grand exhibit of vegetables by Sutton and Sons, to which was awarded a special trophy, and another outstanding non-competitive exhibit of a rock garden, stream and heather-thatched summer-house likewise received a special trophy. Other awards were made to non-competitive exhibits as follows :—

Large Gold Medals.—Blackmore and Langdon, Bath, group of Begonias, Phlox, Delphiniums, etc. ; Dickson and Sons, Marks Tey, group of Roses ; Dickson and Robinson, Manchester, Dahlias, Stocks, etc. ; Dobbie and Co., Ltd., Edinburgh, Dahlias and Roses ; Kelway and Son, Langport, Gladioli ; King's Acre Nurseries, Ltd., Hereford, fruit trees, Roses, Chrysanthemums ; John Peed and Sons, London, stove and greenhouse plants ; Thomas Robinson, Nottingham, cut Roses ; W. J. Unwin, Ltd., Histon, Gladioli ; E. Webb and Sons (Stourbridge), Ltd., annual flowers and Gladioli.

Gold Medals.—Allwood Brothers, Haywards Heath, Carnations and Pinks ; Daniels Brothers, Ltd., Norwich, vegetables, etc. ; Dickson's Nurseries, Ltd., Chester, fruit trees and hardy flowers ; Jarman and Co., Chard, hardy flowers, etc. ; John Klinkert, Richmond, topiary ; W. Lowe and Son, Beeston, Roses ; McGredy and Son, Portadown, Roses ; Edwin Murrell, Shrewsbury, Roses ; F. Rich, collection of Phlox, etc. ; W. H. Simpson and Sons, Birmingham, Antirrhinums, etc.

Silver-gilt Medals.—William Chandler, Rolvenden, for Statice, Profusa, Variety Superba in pots ; H. Clarke, Taunton, Dahlias ; Eames and Sons, Peterborough, Gladioli and other hardy flowers ; Ellisons, West Bromwich, Ferns ; Hewett and Co., Ltd., Solihull, Roses ; Prichard and Sons, Shrewsbury, Alpines, etc. ; Rich and Cooling, Ltd., Bath, hardy flowers, chiefly Phlox ; C. Vickers, Leicester, floral designs ; W. Wells, junior, Merstham, hardy flowers ; H. Woolman, Birmingham, topiary.

Sweet Peas at Utley Show

The striking progress made by Utley (Keighley) Annual Flower Show since its institution 10 years ago was demonstrated by the fine display of blooms and vegetables on Saturday, August 10th.

The entries numbered close upon 400, considerably more than last year, and prizes to the value of £70 were offered.

Mr. M. Stansfield (Cononley) followed up previous successes by carrying off for the third time in succession the J. W. Dunderdale (President) cup and gold medal for most points in the open classes. The cup thus became his own property.

The Mrs. Craven Laycock cup and medal for most points in the local classes went to Mr. H. Keighley, of Utley. In the seven open Sweet Pea classes Mr. W. A. Weston (Cononley) had remarkable success, carrying off the first prize in each class. Mr. Weston's Sweet Peas were remarkably fine, and constituted an attractive feature of the Show. He showed the varieties Gleneagles, Mary Pickford, Patience, and Blue Bird to great advantage.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plan be named should send fair examples of eac stem, leaf, flower, or fruit. (Snippets of and points of shoots are useless.) Not more four plants should be sent in any one week same correspondent. Where more than one is sent they should be numbered. Of conife cones should always be sent.*

Naming fruit—*Several specimens in dif stages of colour and size of the same kind g assist in its determination. Single, unrip deformed specimens are difficult to name do not undertake to name more than varieties at one time.*

FLOWER GARDEN

Definition of herbaceous plants

I should be grateful if you would give a definition of " herbaceous " which can be quoted as authoritative. At a recent local show in a class for herbaceous blooms, six vases, the first prize was given to a collection which included one vase each of Lilium regale, Lilium candidum, and Gladioli. Was the award of the judges correct? OUTIS.

[Herbaceous plants are perennials whose stems die back to the ground each year after flowering. Strictly speaking, bulbs such as Lilies and Gladioli are herbaceous. Many schedules contain the words " bulbous flowers excluded." In the absence of such wording it is probable the judges might be wrong in disqualifying. Many of the schedules are worded in such a way that judges find it difficult to decide as to what the local committee intended. It is quite possible in the case in point that the local society intended to exclude bulbous plants and the judges may have been so informed. It would be a good plan if local Horticultural Societies would insert in their schedules a small paragraph calling the attention to the herbaceous classes where bulbous plants are to be included.]

Meconopsis Wallichii in Scotland

Does this Blue Himalayan Poppy flower out-of-doors in Scotland? Here, in East Lothian, the plants come up year by year and look healthy, but have no blooms.

G. W. H.

[This Blue Himalayan Poppy flowers well in several parts of Scotland, but appears to bloom best in the districts which have a fairly heavy rainfall. It should flower with you, but probably requires more moisture than it receives in an ordinary season in your district. If you cannot give the plants a moister and richer soil, give them a little shade and occasional soakings of water in spring.]

Pentstemon

(Reginald J. Hope).—We do not know Pentstemon Cyanea, but your description answers to that of P. cyanthus, a beautiful plant from the Rocky Mountains, which bears dense clusters of blue flowers. This plant is closely related to P. Glaber.

Iris Kæmpferi

I shall be obliged if you will tell me when the water should be withdrawn from the Iris Kæmpferi—now that they have finished flowering or not till later in the autumn? A neighbour of mine leaves his in the water all through the winter, and they seem to do equally well, although I have always understood that they need to be dried off for some months. H. L. GAYE.

Seaton, Devon.

[The water should be withdrawn about the end of October and brought on again about the first week in April. This Iris is not always happy with its toes in water winter, and we think your suggestion one.]

Rose of Jericho

I should be much obliged if you wo me know the botanical name and order Rose of Jericho? I bought a specimen the other day, and now that expanded and turned green in water.

E. R

[The Rose of Jericho, otherwise kno Resurrection Plant, is Anastatica chuntica. It is an annual indigenous Egyptian deserts, and belongs to the order Cruciferæ. When full grown thi contracts its rigid branches into a rou and is then tossed about by the wind sands. When it alights in water or on ground the branches relax and open if its life was renewed, hence the nam surrection Plant. It is increased by see this country it requires protection durin months. Selaginella lepidophylla is known as the Resurrection Plant.]

Diseased Iris

(Ruth Skelton).—It is difficult at this to account for the death of your Iris. formalin treatment should not have kil rhizomes if they had been unaffecte the disease. Naturally, the drastic tre recommended for the cases of Soft Rot you quote were only recommended persons who had actually sent us in ma and from this we were able to judge th only chance of saving the stock was to and attempt to find some healthy par off any bacteria adhering to these h parts, and replanting them in fresh so the cases quoted there was just a chan the treatment might save the vari taken in time. If they had been left to plete their growth the rhizomes woul all gone. Another time do please se specimens before adopting treatment mended to someone else. Formalin at cent. is now recommended for the tre of various bulbs, corms, and rhizomes a with various diseases, and provided th is carried out well no harm results. is, of course, no control for either or the bacteria rots if the organis actually got into the whole of the h pieces of healthy material can be sterilised and replanted, then it is pos save the variety. Let us examine diseased Phlox ; it may not be eelw there are other causes of failure.

Trillium seed

I had a fine display of Trillium American Wood Lily) this year, and th pods have ripened nicely. Should the be sown now, or when, and at what Is any special treatment necessary?

RENFREWSH

[It is usual to sow seeds of the Trilli soon as ripe, but if you have a quan seed we would advise retaining part of i nd sowing this in a frame. There is t difficulty in raising these plants. efer light soil, which should be well ip, and a little leaf mould mixed with v thinly, and cover just slightly han the depth of the seed itself. ff separately after growth starts in

Helichrysums

M. Talbot).—Cut the flowers on a ay when perfectly dry. Tie them in ndles near the base of the stems and m heads downwards in a cool, dry, until the leaves have quite withered.

of Dahlia "stools" during winter

either (after drying) place these in in a box in a dry, frost-proof shed same up in a dry cellar. Can you lvise me which is the better and ethod to adopt? I find that amped like Potatoes under straw with soil so many stools are be rotten in the spring.

"ANERAWD."

roots are properly dry and the soil perfectly dry also, we favour the of the Dahlia roots in the box, good results are had by laying them out covering of any kind, in a dry, f shed or cellar, and in such a posi- are easily examined during the ason.]

cuttings

u kindly tell me the best time to ngs of Calceolarias, Salvias, and tes? Will they do all right if I put oxes in a cold frame and just give pe heat to keep out frost at night so, should they be put into small they are rooted, or left till spring? and they do not require to be put greenhouse at all, but simply left me all the winter. Is this correct? ill you please advise me the best al with the matter right through? ter should be given these things nter? NOVICE.

cuttings of the Marguerite at once, those of the Calceolaria until the ptember. You do not say which refer to. The blue variety, S. best cultivated by lifting and pot- oxing the old plants in September ng them in a cool, yet frost-proof e or frame and securing cuttings e in spring. It can also be easily m seeds sown in the greenhouse The red, S. splendens, is best a half-hardy annual, the seeds in March in the greenhouse. The alceolaria should be given a cold. artificial warmth of any kind essary. Given water when in- se latter should require no more h. The others should only have n the soil is approaching dryness. Marguerites in spring.]

GREENHOUSE

um cuttings

o my Geraniums (Paul Crampel, naking much growth this year, I t present I cannot take any cut- out cutting the plants right down and and spoiling the nice show of ave. Will you please tell me if I until the end of September (when all) and take the cuttings then and oxes of soil and put in the heated , should they root all right then? ot up what is left of the old plants hem in 5-inch pots in a heated , will they give good blooms next What water is required by these plants, also the newly-rotted cuttings during winter, and when should I start to encourage new growth to get them ready to bloom from the end of May. NOVICE.

[You can easily root your Geranium (Zonal Pelargonium) cuttings at the end of September if frost has not damaged them by inserting in boxes of very sandy compost and setting them in a slightly heated greenhouse. Do not shade these cuttings, and be very sparing with water all autumn and winter, always allowing the soil to be pretty dry before giving more, but when it is necessary to do so, enough thoroughly to moisten the whole of the soil must be given. The old plants can be potted up, using soil similar to that in which the cuttings are inserted, and, as with the cuttings, giving water sparingly. In February you can begin to encourage growth, so as to have good plants for setting out at end of May. Do not, however, employ too much heat.]

TREES AND SHRUBS

Pruning Lavender

Could you tell me the best time to prune Lavender hedges? The last two years I have had hardly any bloom. I have pruned it after flowering. Could you also tell me the best time to prune Veronica bushes? Should the old wood be cut out or the bush shortened? I find mine hardly flower at all if I cut them back. ROSEWARNE.

Mawnan.

[Lavender requires no actual pruning, but after flowering the old flower stalks should be trimmed off with shears, and any unruly branch cut right back. Unfortunately, you do not state the species or varieties of Veronica you wish to prune. Some require very little pruning, while others should be well cut back after flowering. If you will acquaint us with the names of the varieties we will do our best to assist you in this matter.]

Lavender bushes unhealthy

(Scot).—We advise you to cut hard back all the plants affected, as this will encourage fresh, healthy young growth to develop from the base, unless the roots have been too seriously damaged. We can give no reason for the plants' behaviour unless the roots have come into contact with some deadly substance in the soil, such as weed-killer, etc. A chalky sub-soil should be all in their favour.

FRUIT

Diseased Cherries

(Puzzled).—Your Cherries are affected with a fungus called Sclerotinia cinerea, which affects Plums and Cherries. In turn it attacks the flowers, fruit, and wood of both its hosts. When attacking the flowers the disease is called Blossom Wilt; fruit, Brown Rot; while the attacked wood is called Wither Tip. There are two specialised varieties of the fungus concerned, because one type attacks Apples in all three stages and the other Plums and Cherries; thus the Apple form will not affect Plum or Cherry, and the Plum and Cherry form cannot attack Apple. The control for the disease is to remove and burn all affected portions, paying attention to dead spurs as well as the affected fruits and dead tips of the young wood. The cutting out can best be done during the growing season. The fungus over-winters in all the portions attacked, but especially in the mummified fruit on the ground or still attached to the tree. The spraying to be carried out consists in applying a winter wash immediately before the swelling of the buds. The formula for the wash is :—Soft soap 1 lb., caustic soda 1 lb., water 10 gallons. Lime sulphur applied from time to time at summer strength helps to keep the disease in check in bad cases. Usually the fungus can be kept under control by "cutting out," if the work is well done.

Mildew on Grapes

(H. J. M.).—You are probably aware that dryness at the roots will sometimes predispose a Vine to an attack of Mildew, whether growing indoors or out, and it has occurred to the writer that such conditions may have had something to do with your trouble. However, we strongly suspect that it is a case of management, especially during the early stages, as the berries appear to have set very freely. We advise you to call in a professional gardener who is successful in the culture of Grapes before another season, as such advice as he would be able to give—seeing the local surroundings—would prove valuable to you and worth your while. This season dust all the foliage and fruits with green sulphur, keep the house drier, but not the roots, avoid draughty conditions at all times, and dress the surface of the inside of the house with sulphur, even pointing it into the border. All other conditions correct, the early closing and spraying of the Vines, also the dripping water from the leaves when tapping the rods early in the morning is what good growers like to see, certainly the writer of these notes; but the spraying should always be done early enough to admit of the Vines drying before night. The drops you refer to are gathered from the atmosphere later. You must air the house on the sheltered side only at all times. Spray the structure with potassium sulphide.

Diseased Melons

(Perplexed).—Your Melons are not affected by canker, but by a fungus called Verticillium albo-atrum, which produces the well-known Verticillium Wilt of Melon, Cucumber, Tomato, and many other plants. The fungus concerned makes most headway under low temperature conditions, and therefore is troublesome in spring and autumn. We do not quite understand from whence your plants became infected, because you state that you used sterilised soil. It may be that the cause of infection was the water supply. It is important when growing Melons thoroughly to clean down the houses at least once a year, and all water tanks should be cleaned out and sterilised at the same time, because Verticillium is able to over-winter on rotting wood and organic remains of all descriptions. It is sometimes possible to save an infected crop if control measures are undertaken in time. So soon as Verticillium Wilt appears the average temperature of the house should be raised to 77 degs. F. This can be done by boiler-heat and by closing down the houses earlier in the day. A light dressing of whitewash should be applied to the glass, and, if possible, no water should be given to the roots. The plants should be lightly sprayed overhead and encouraged to make fresh roots above the diseased portion by placing new soil around the collars of the plants. We expect that your plants have gone too far for you to adopt these controls with success, but they are useful if taken in time. Watering with Cheshunt Compound from time to time as a preventative helps to keep the fungus down in places when it is troublesome. This disease is quite distinct from Melon Canker.

Diseased Pear

(G. G.).—Your Pear foliage is affected with Pear Scab. Please see reply to "G. W. B.," Northampton, on page 587 of our issue for August 24th. With such a bad attack, it would be advisable to spray the tree at once, if it is not carrying any fruits or immediately the fruit is picked, with a solution of lime sulphur, using 1 gallon of concentrated wash in 29 gallons of water. Rake up and burn all the diseased foliage as it falls, and cut away the attacked wood. Spraying as advised to "G. W. B.," Northampton, will control the trouble, but do not be too disappointed if the control is only partial the first season; you have a bad attack.

Pear Scab

(E. Shaw).—The disease on your Beurre Superfin Pears is due to Pear Scab. Please see replies as above.

Nectarines

Will you be kind enough to give me the name of a Nectarine that would come in about the same time as Elruge, or perhaps a little later? I am not particular about the size of the fruit if it is a good flavour.

MAC.

[A first-rate Nectarine, ripening about the same time as Elruge, is Lord Napier, while Humboldt is also very reliable.]

Old Gooseberry bushes

("Deanyers").—Without seeing these old Gooseberry bushes it is impossible to say whether it would be worth while retaining them. Seeing they are so old, however, we would be inclined to grub them up and burn them. In making a new plantation, select a spot where Gooseberries have not been grown for some years, if ever, and dig it well, but unless the soil is very poor, give no manure, as this material causes rank, unfruitful growth. Good varieties are numerous, but Whinham's Industry, Crown Bob, Whitesmith, Warrington Red, Hedgehog, and Early Sulphur are all reliable and early croppers. Plant in November or February.

MISCELLANEOUS

Converting gravel to grass path

("Deanyers").—You must first remove the gravel, stones, etc., which are usually employed for making a walk, the cavity thus made being filled with not too rich soil, but quite free from weeds. This soil must be made very firm and the surface level. The turves from the meadow may, or may not, be suitable for this purpose; it all depends on the nature of the grasses. Some are so coarse growing that no amount of mowing and rolling will ever bring them to form a nice sward, while others in time turn out quite satisfactory.

Potting soil

("Gardener").—We have examined your sample of soil, and find that it does not contain a trace of lime (calcium). It appears to us likely that the lime shortage is the cause of your failure, with the material as a potting medium. Soil which "greens" very readily is nearly always short of lime, even under outside conditions, and when used for pot work the trouble is worse. The hard water could not have the effect of turning your soil green. Very hard water is, of course, bad for pot plants, and where such is the only source of supply the water should be run into tanks and allowed to stand for a period before being used. Write us again if we can assist you further. Please see reply to "Anxious."

(Anxious).—We have examined the sample of soil and specimens of Gloxinia, Begonias, etc. We find that the soil is slightly on the acid side, and although this would account for some plants doing badly when potted in it, we do not think that the acidity would affect the plants you have sent. As a matter of fact, we find that all the roots of the plants sent are dead, and in the case of the Begonia Lorraine the stem is decayed an inch or so above ground level. It appears to us that perhaps something was put into the potting mixture, which has burnt the roots. Is it possible to shake out the plants and repot them in a fresh mixture? You will appreciate the fact that all the roots are in a bad way, and that little water is required beyond lightly syringing the plants until a new root system is formed. If all your Lorraine Begonias are like the one sent we fear there is little hope for them. When turf from old pasture is taken for potting purposes, it is wise to give a dressing of quicklime before the turf is lifted, or the turf should be well sprinkled with lime when it is stacked to rot. As stated above, we do not think the acidity of the turf has had much to do with these plants going wrong. We are arranging for an article to appear shortly on the cultivation of Begonia Gloire de Lorraine.

Bare patches on lawns

(Montague Bethune).—Any good seed merchant will supply you with a suitable mixture of grass seeds for making good the bare patches in your tennis court, but if you have any difficulty, write to Messrs. Sutton and Sons, Reading, who specialise in lawn grasses, and who also supply an anti-Clover dressing that would greatly reduce the Clover you complain of. The last half of September would be a suitable time for sowing the seeds, or else about mid-April if the former is unsuitable. It is much more difficult to deal with the Couch grass. Should it only be encroaching on one side it would be advisable to lift the turf and 9 inches or 12 inches of the soil underneath, as far as the roots of this grass extends, making up with fresh, clean soil and turf. Otherwise there is no cure for this trouble.

Various questions

(L. T. Handsworth).—(1) Just make the measure full without any pressing down. (2) You can mix the materials named by weight. (3) No; bone-meal and dissolved bones are quite differently prepared. If you cannot get the latter, use superphosphate of lime for the same purpose and at the same rate. (4) Yes; 4 inches of ashes, if well firmed, should prevent worms entering the pots placed on them. (5) Half an ounce of potassium sulphide to 3 gallons of water is safe while the foliage is tender. Later, this may be increased to nearly double that amount. We would not care to risk spraying while the plants were in flower. (6) To make paraffin jelly, the proper proportions are:—1 gallon paraffin oil, $1\frac{3}{4}$ lbs. soft soap, 2 gallons water. This jelly can be used at the rate of about 1 lb. to 4 gallons of water, applied as a fine spray.

An unsatisfactory lawn

(M. A.).—It appears to us that the work of laying out your garden, more especially the lawn part, has been mismanaged. The main reason for the grass failing is that the more fertile portions, viz., the surface soil removed with the turf, has left nothing for the roots of the young grass to feed on, the hard, inert, clayey soil being quite unfit for the purpose. Before sowing the seeds, an inch or two of fine, fresh soil ought to have been spread evenly all over the surface, as in this the young grass plants would have rooted freely, and as they gained strength the said roots would have been able to penetrate the hard surface underneath and so got well established. As the ground has sunk so much in parts, the workmanship has been at fault, or, more likely, the want of experience in such work of the labour employed is responsible. The laying down of a lawn requires more than a little knowledge of such work, but as we have no idea as to the terms of the contract you had with the firm who carried out the work, we are not
in a position to advise as to whether
compel the firm to put the thing right,
are afraid that you will have to dig
whole of the ground, levelling it
and then firming it uniformly. It
the ground, instead of being all
dug, as it ought to have been at
simply been levelled, with the
sult, the spots merely filled up have
while the portions undug are naturally
and so have retained their original
Merely to spread fresh soil all over th
face might do some good, but it is
possible by this means to properly
the low portions, so that there would
be the chance of such spots again
The ground should be moist, but not
wet, when this work is being carried

LEGAL POINT

Gardener's notice

(W. A.).—We are afraid you are

forcing. A warm greenhouse, with shelves near the glass, is the place for these most useful winter-flowering plants.

Sparmannia africana is one of those good old-fashioned plants that ought to be found in every greenhouse. I give the plants of it a good shift after they have done flowering in spring, and return them to the greenhouse until the summer is fairly advanced, when they are set out-of-doors and kept well watered until September; then they will be covered with flower-buds and must be returned to the conservatory, where they will flower all through the winter.

The white Abutilon Boule de Neige I treat in the same way, and it is never out of bloom, every leaf having a bunch of pure white flowers at its axil. C. S.

Sweet Peas in readers' gardens

YOU may possibly think the enclosed photograph worthy of a place in your paper. Unfortunately, owing to a fruit cage close by it was not possible to get a very satisfactory photograph. These Sweet Peas were grown in my garden this year and produced some very fine blooms. The seeds were obtained from Messrs. Dobbie and Co.

(REV.) C. H. WILSON.

Swanmore Vicarage,
Bishop's Waltham, Hants.

For a prolonged display of good Sweet Peas I find that rows of spring-sown plants are valuable to succeed the autumn-sown. The ground is prepared in the winter by deep trenching, adding some well-rotted manure, with a sprinkle of bone-meal, and if available a dressing of lime rubble all well worked into the soil during the digging. Seed is sown in early February in pots or boxes, placed in a greenhouse with slight heat. The seeds soon germinate, and when the plants are nicely through they are taken out and placed in a cold frame. They are potted up singly when well rooted and grown along in frames with abundance of air, the lights taken off on every occasion during mild weather. I find the following a good dozen:—Model, What Joy, Pinkie, Charming, Grenadier, Powerscourt, Susan, Youth, Jack Hobbs, Royal Purple, Mrs. A. Searles, and Magnet.

Roses of 1929 in a Scottish garden

"J. R. K.," when defeated in argument, endeavours to cover up his discomfiture by accusing his opponent of the very fault into which he himself has fallen. He states that I have never replied to certain questions he propounded last autumn, but as I certainly did, to the best of my recollection, answer such of his points as emerged from the labyrinth of high-sounding phrases with which he was pleased to clothe them, this somewhat hackneyed method of trying to get himself out of his difficulties does not "cut much ice."

At the very first, "J. R. K.," if not in so many words, certainly by inference, wished me to believe that a Rose was either good or bad, no matter what the season happened to be. He may not, as he now asserts, have meant to convey this impression of his meaning, but if, instead of going "miles around" the matter, he had simply stated what he did mean, then there would have been no confusion. For I simply stated, and emphatically repeat, that the season has a good deal to do with the behaviour of the great majority of Roses. Even the last paragraph (page 591) of "J. R. K.'s" latest effusion is by no means so terribly conclusive, as our friend fondly imagines. Los Angeles does not always hang its head. We have had some lovely blooms of this variety this season, while the weather was dry, that stood up beautifully, so what about "constitutional" and "seasonal" failings now? A plain statement of one's experience ought not to throw "J. R. K." into a state whereby he must arise and, figuratively speaking, wipe out the one with whom he disagrees.

Bulbs direct from Holland

The late William Bateson called in some years ago at Stevens' Auction Rooms in King Street, Covent Garden, to look at a sale of Japanese prints. In another room a sale of bulbs "direct from Holland" was in progress, and Bateson thought he might buy a few bulbs to plant round the lawn at the back of "The Manor House." He selected some lots of pink and white Tulips which were knocked down to him, much to his surprise, for a few pence. The explanation of the price was clear when the bulbs bloomed in the spring—the Tulips were all double green with a few flakes of white and pink. Fortunately they had come into the hands of the one man in the world who enjoyed both the Tulips and the adventure.

People who buy bulbs are quite safe when they deal with firms of good repute, whether in Holland or England, and as the "English Retailer," issue August 31st, page 593, rightly says, the decision is generally influenced by the question of price. This, however, varies most unreasonably. Take the common pink Hyacinth, Countess of Derby, I have looked through some 15 English and Dutch lists and find this Hyacinth quoted, first size, at prices varying from a ma
of 1s. 3d. a bulb, or 12s. a dozen, t
bulb, or 5s. a dozen.

Sweet Peas, spring sown, at Bl
House Gardens, Oxted

I occasionally find myself in hot w
trade horticultural papers—by the

Primula pulverulenta Bartley Strain

When I offered to give plants of Primula pulverulenta Bartley Strain away, I did not expect such a response. I cannot possibly answer each applicant. Several applicants were considerate enough to pay postage. I naturally gave them preference, for the expense of lifting, packing, and posting several dozen parcels is considerable. I hope to have a good report of the plants in the early summer of next year.

G. H. DALRYMPLE.

Bartley, near Southampton.

Tropæolum speciosum

This plant does extraordinarily well with me, planted among Rhododendrons in a heavy soil made up with plenty of leaf-mould. Five small groups were planted 18 months ago, each group had about six or seven pieces of root in it. The plant has spread all over the bed, smothered the Rhododendrons, covered Pea-sticks at least 7 feet high, and spread in every direction far away from the original groups, and all this in spite of a continuous drought. It has been in flower for many weeks, and the berries are now beginning to colour. I am often asked what I do to make the wonderful growth. I do nothing. I just leave it alone.

Sweet Peas of recent introduction in a Wigtownshire garden

The Sweet Pea has long been recognised by floral experts as the finest of all annuals and the most floriferous. From the confines of July till the end of November—at least in this peninsular region of Scotland—its flowering is continuous. It now embraces a great variety of charming and exquisite colours, ranging from the purest white to the deepest purple, as in the striking example of Baron Hulot, and brightest orange-scarlet, as in the notable instances of Royal Scot and Flamingo, both of which were raised by Messrs. Dobbie, of Edinburgh, who have always made a speciality of this impressive (and accommodating) flower. Though its original fragrance has suffered perceptibly, through the influence of excessive hybridisation, this element having been sacrificed by enterprising raisers on the altar of size (while modern Roses have lost the same incomparable attribute in a similar way), there are still left a considerable number of the grandiflora varieties that can be obtained. There are many cultivators who have no special desire that the really odorous Sweet Peas, to which I have alluded (and whose form is also artistic), should be utterly extinguished. Next year, therefore, I intend to grow some of the most effective in colour, and not the least fragrant, of the finer grandifloras.

Of the new varieties, which, of course, are large and crenulated, and have in certain instances four flowers on a stem, some of the most conspicuous are Flamingo, Carnival, Idyl, Kitty Price, Reflection, and Winnie Morse, all of which, with the exception of Flamingo, were raised at the great nurseries of Mr. Lester Morse, near San Francisco, whose chief superintendent is Mr. Frank Cuthbertson. While all of these varieties have gracious attributes and various delicate shades of glowing pink, to me the most fascinating has been Reflection, whose colour is a wonderful Delphinium blue. This is the most distinctive Sweet Pea I have had the privilege of seeing for many years. Atmospheric influences for its perfect evolution have not been inspiring.

DAVID R. WILLIAMSON.

Effective colours of Pink Roses, Nepeta Mussini, and other flowers

Outside my window where I am writing there is a border of Roses, consisting chiefly of varieties comprising rose and pink shades of colours—Caroline Testout, Mme. Abel Chatenay, Mrs. Henry Morse, and others. A number of these are at present in full bloom. This border is edged with Nepeta Mussini, also a mass of bloom, framing the Roses with its grey aromatic foliage and lavender-coloured flowers. Looked at from a distance, the subdued hazy colour effect produced by the lavender and pink is particularly pleasing to the eye. The Nepeta is planted alternately with clumps of Dianthus hybridus roseus, but the latter finished flowering at the end of July, when the old flower-stems were removed. This pink made an extremely fine show during June and July, and here again the Nepeta and pink being in bloom together made a pretty effective edging to the border, which was greatly admired. Another charming and effective display was obtained from June onwards by several large drifts of Dianthus deltoides and Nepeta Mussini growing adjacent to each other on gently sloping ground, broken at intervals by a few large stones placed at irregular distances. Here we have this Catmint growing in various aspects and situations, and in all of them the plants seem quite at home, flourishing and producing masses of bloom. Small plants replanted in the spring are now 1½ feet to 2 feet across and simply covered with the labiate lavender-coloured flowers. The soil in this district is a strong clayey loam, inclined to heaviness, but these plants simply revel in it. Catmint is a most accommodating plant and makes a fine subject for the top of a dry wall, elevated positions on the rockery, or used as an edging to paths and borders. Its culture is of the easiest, although it certainly appreciates a sunny position. Cuttings root readily any time in summer and autumn. It may also be increased by division of established clumps in the spring, when they will soon form bushy plants. If these are transplanted to the positions they are intended to occupy in early summer they will quickly make good plants and continue to flower for the remainder of the season. J. L.

Rose Cupid

I ENCLOSE a photograph of Rose Cupid. One could hardly see the leaves for the quantity of bloom of a bright fawny-pink colour. I have observed that Roses like Cupid so often grow splendidly when their roots are under stone flags. L. KNOX.

Midhurst, Sussex.

Calendulas or Pot Marigolds

Very many amateurs take cognisance of the Calendulas in spring when they sow seeds of other annuals, and overlook the advantage there is in getting the seed in at this season. If sown out-of-doors now, one may have plants which will commence to flower by the following May, and will yield many blossoms long before spring-sown plants come to beauty. Calendulas also are one of the most useful plants one can have for flowering in a cold frame or cold greenhouse during winter or early spring.

In a house which can be heated, the merest suggestion of warmth sufficient to dispel damp will bring plants into bloom by Christmas. This is my plan with them. In August I prepare soil from old potting material, mixed with a little garden soil and sand, and after well crocking some 6-inch pots, sow two or three seeds in each, selecting the strongest seedling, and growing it on, one plant to a pot. The pots are stood outside until about the end of September if the weather is not too bad, and then they are brought in a cold house and kept on a shelf near the glass which affords abundance of air night and day. Not until the weather gets very cold do I bring the plants indoors, as on more than one occasion the late autumn has been so mild that, stood under a south wall, they have not been brought under cover until October. The plants are hardy, and it is only because one runs a risk with the buds becoming frosted that it is needful to watch the weather. Calendulas give us bright orange and yellow blooms so lavishly, and are so delightful for cutting, that it has always been a puzzle to me why more do not make a sowing in August. They dislike a stuffy, overheated atmosphere, and only ask to be kept from actual fros bloom them late in the year. No anna more simple to deal with, whilst none a greater reward of blossoms. W.

"Gardening a Hobby"

A broadcast talk given on Aug. 27 by Col. F. R. Durham, Secretary of the Royal Horticultural Society. Published by permission of the British Broadcasting Corporation.

"GOD ALMIGHTY first planted a garden, and, indeed, it is the purest of human pleasures. It is the greatest refreshment to the spirits of man without which buildings and palaces are but gross handywork."

Thus wrote that wise philosopher, Bacon, in the sixteenth century.

Do not be alarmed, a text does not mean a sermon. I am no preacher, no speaker. I am just at home with a microphone simply gazing at me open-mouthed, so to speak, ready to swallow wholesale what I choose to confess, all without questioning or interruption. And you are all supplied with such a simple remedy to defend yourselves. How we do all like silent admiration.

Rose Cupid on a suitable wall

I fear I have little excuse to speak to-night unless it be in my capacity as Secretary of the Royal Horticultural Society.

Why speak on a hobby? You who exercise it know all its virtues and vices so well you do not want platitudes; you who do not, will not want to. But between the "you do's and you don't's" there are "you who might's," and you may be interested. I am not a great gardener, may be, not a good gardener. I was once reported to have said that you cannot be a good gardener until you are over sixty. That was a misunderstanding. I am not sixty, but gardening is my hobby and recreation.

Now to be a little more serious.

Gardening has been the first hobby of mankind. My text tells you so. Let me strip from the days of the Garden of Eden and get down to more recent times. Let me tell you of the Society which has accomplished more to inspire the cultivation of this hobby than anything I can say or the little I can do in assisting its activities.

On March 7th, 1804, over 125 years there met at Hatchards, the well-kr booksellers in Piccadilly, six men, eminent in the science of botany and l culture, to found the Horticultural Sc of London. The objects were "to c every information respecting the culture treatment of all plants and trees, as culinary as ornamental," to foster and courage every branch of horticulture an the arts connected with it, and "that it be considered within the intentions of Society to give premiums for improven in horticulture wherever it should be pedient to do so."

I scarcely need to prove to you that have succeeded. Our gardens have bee riched by the collectors sent out in t early days and are still being enriche further plant expeditions. Our cultiv has been improved, the advance in be of our garden flowers has been one continuous triumph, the improvement of fruits and vegetables are enjoyed by all, the premiums, the awards to these imp ments, carry a world-wide standard of e lence quoted throughout the horticul literature, both scientific and trade. Ou that small beginning there has grown Royal Horticultural Society, the oldest largest horticultural society in the w with nearly 28,000 Fellows and Assoc and 600 kindred societies affiliated. now there is no nation in the world that brought gardening to such perfection as country, providing a recreation throug the length and breadth of the land in w rich and poor, young and old, meet tog in competition to enjoy the great gift Nature.

Why, then, if such success is establi is it necessary to praise or plead for hobby?

The answer is in my text, "It is the p of human pleasures."

John Habberton years ago wrote a b "Helen's Babies." "I want to see wheels go round," says Budge. "Wa shee the wheels go round," echoed To and so it echoes on.

We live in a mechanical age where tendency is to be more and more subser to mechanism. Nevertheless, I believe, I say so watching the development of Society, I believe sincerely that this fact of mechanical development will lea a quicker appreciation of the wonders garden, and the more "Robotic" our lives become, the more shall we strive to away and seek the seclusion of a ga where we can with our efforts in our way work with our hands to produce create, to find that refreshment of our spi And what have our opportunities been, what may they be so that this entran hobby-horse may ride on, gaining one cess after another?

The opportunities we have had, and opportunities that lay before us, are no all one and the same. First the hobb inbred in our nature and only requires gr for its further development.

This country is a favoured country. contains nearly the whole range of the logical strata known, and the weatherin rocks and their disintegration have prov variation of cultivatable soils suited :inds of plant life. This country has abused climate, but however much the climate is temperate, free from reme ranges of temperature, the torrid d rigorous cold of continents. Plant ys itself. Plants brought from nearly ıtries thrive, the half-hardy annuals the summer, the delicate rock plants e mountains and plateau, with a little on survive the winter, and the sub- plants enjoy the mild sea coast warmed under the influence of the ream.

are the permanent opportunities on ve may build our hopes.

ow for those opportunities we have and must maintain.

onstruction of our housing, the lay- the dwelling quarters of our cities, and villages, the self-contained house a piece of land, the detached and ached houses, with their little gar- ck and front, and the country house pleasure grounds and park, all these en the nursery of our hobby. The self-contained apartment house, the easing blocks of flats, and the multi- easy-going boarding-houses, all eir labour-saving devices and paved d courts, fit only for the cultivation ray cat, all these are obstacles in the our hobby. "Gross handyworks"

pressing insistence for the recon- of districts of our cities and towns ed for one reason or another, let us our love for the self-contained home of land, and demand its fulfilment. along our new trunk roads, if we ve ribbon development, let it be a ent with ample garden space, both back, the front to help the humbler architecture and beautify the road- back for the peace and contentment ves after the daily routine is done. ample ribbon development will he care and protection desired by the eautifying Association in their work. of a beautiful tree will be installed nds, and the destruction of the road- ting of the Kingston by-pass road r recur.

ne word more, although the ideal se with a garden cannot be attained ed city areas, I would put it in the those interested in the reconstruc- ousing the more humbler section of ulation (I hate the hard word) that there may be a possibility of a "community" garden. This is by the wonderful gardens made in mews, on building sites waiting ent, or little open spaces in between nest streets in London where the Children's Garden and Recreation as its being. The little crops of s, Carrots, Turnips, Radishes, etc., bunches of flowers, all grown and by the children of these mean bring as much pleasure to these ildren to gather and take home as ition of a rare or wonderful hybrid the Society's fortnightly meetings he more fortunate owner.

me not forget a gardener's thanks organisations affiliated to my such as the many allotment societies London Gardens Guild, all working preservation and development to city garden possibilities.

games the keenest are those who not the spectator. If we want a we want the picture we like, and do the picture dealer to decorate our We must be our own gardener, and idle spectator watching professionals; that is to say, if we really want to enjoy the hobby. Our grateful audience is always to be found in our co-hobbyists and those who wish for a rest and have no gardens. The garden then has an individuality; it has its own pride. Often wandering round the intimate gardens, how easy is it to know the character of the owner. Let the garden be in part the expression of your character; it will help to form it. Flowers never quarrel or make quarrels, they are soul of contentment and peace.

A garden may become a collection of beautiful flowers, a collection of choice fruits, or a collection of luscious vegetables, all and every one well grown, healthy and fruitful, will provide beauty and pleasure. It is only a matter of arrangement, the expression of the individual's taste. Perhaps the most fascinating form of the hobby—I speak selfishly of my own little garden—is the collection of pleasant reminiscences, of travels, of gifts, and even of hardships. What is more delightful than the Latin names so troublesome to many of us, than the history of the acquisition of plants, the person who gave it us, the prize it won at a local show, and the place and circumstances from whence it was obtained? And the chance seedling found in the garden. This chance seedling may be the pride of the garden, many, many of the hybrids treasured by so many of us obtained from gardens of our friends, selected and bought at flower shows, have their origin as a seedling in a garden, a little gift of Nature.

My little garden has acquired quite a number of plants, seeds brought by the wind, by the birds, or by some unknown vehicle, sown where it pleased them. Nothing valuable, but still interesting.

And this brings me to the subject of weeding, the routine of the tidy garden.

How often have I wished that some great gardener would give us a lecture on "intelligent weeding." Weeding is often thought to be a bore, an unkindness displayed by Nature towards our efforts. Weeding, I maintain, is not nearly so dreadful in spite of all its knee bending and back breaking. Weeding really brings you in contact with your garden. Routine work means the knowledge of detail, and the knowledge of detail builds up the whole work. No matter, by the way, whether it be gardening or any daily work.

Weeding in the garden gives the whole opportunity of plant life study; we observe the habit of the plants we grow, we learn their root requirements, we can observe the insect life, find the insects which destroy those injurious to our plants, we can watch the bees and the ants; in fact, natural history opens its pages of wonders to us. Weeding should not be dull. We learn the small seed leaves of plants, we distinguish between the good and the bad, we find the chance seedling as something novel, as something which will replace a lost plant. In fact, gardening by ourselves may be described as Hadji Baba describes the start of his voyage from Persia to England, "We cast the anchor of Curiosity into the harbour of Expectation." Weeding, in fact, is the incentive to greater efforts. And when the dormant season comes, winter with Nature's rest for the recuperation to be divulged in spring time, gardening as a hobby can still hold its own. It is a game that can always be played; it is like a newly acquired foreign language; it has a literature of its own well worth reading and studying, arousing interest in the works of travels to learn of countries where plants have been brought from, and of the fascinating stories of natural history. There are, too, the catalogues inviting you to make up lists and seeds of plants, with the only disappointment as a rule that Christmas expenses forbid the sum total of your innermost wishes. Gardening is indeed a fine hobby, and, if exercised with devotion, will leave the golf clubs, tennis rackets, lacrosse sticks, croquet mallets, and the like to decorate the hall, whilst the rooms will be gay with flowers and table furnished with fruits and vegetables.

I began with a text. I will end with a definition and a text.

Johnson's dictum on hobbies was, "Hobbies, Sir, are the means by which men prolong their own lives and bore others to death."

Therefore, with the words of Voltaire: "Cultivate the garden."

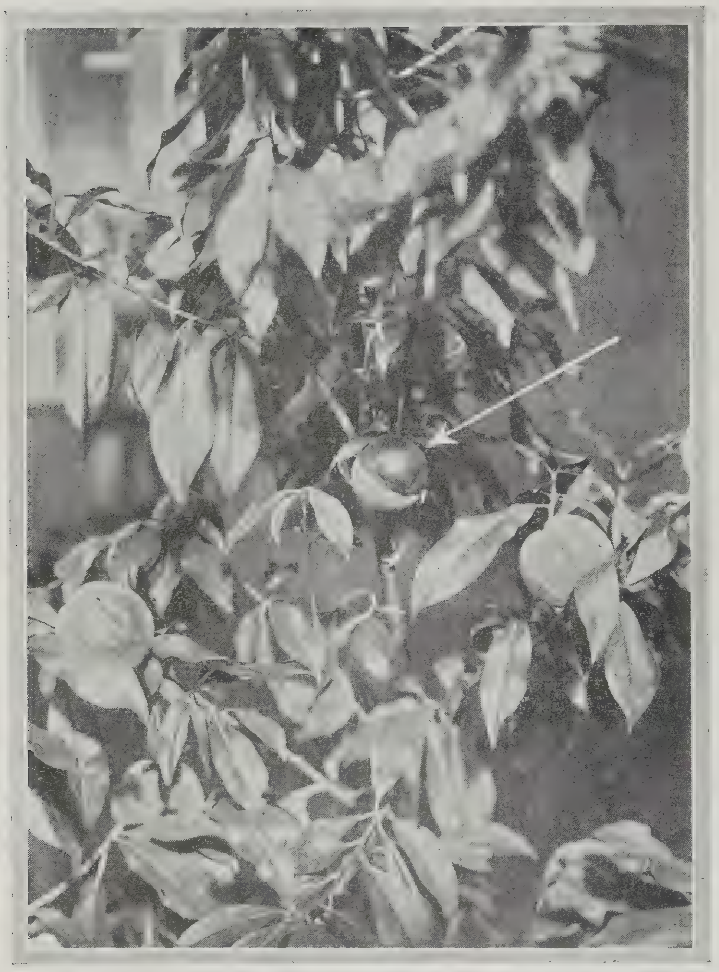
Cleaning the greenhouse

Where greenhouses have been occupied during the summer with a variety of flowering plants that presently will have to give place to other plants quartered in frames or open ground for winter blooming, as, for instance, Chrysanthemums, Zonal Pelargoniums, Primulas, Cinerarias, and the like, it is advisable that the house should be rendered clean for their reception. It is doubly important that the place should be thoroughly cleansed if it has been occupied by Tomatoes or Cucumbers. First, then, it is best to choose a dry day for the job, and after removing all plants to frames or standing them in the open, to disinfect the house. I know of nothing more searching and calculated to kill pests of all sorts, including White Fly and Red Spider, than ordinary brimstone. It can be purchased for about 4d. per lb., and if it is pounded up it is ready for use. It is a good plan to put a fire in the stove on such occasions, as then one can take a few shovels of hot coke, placing it on the floor of the house or in tins, throwing over this, while hot, the brimstone and immediately coming out and closing the door. The ventilators should be closed, of course, and any crevices stopped up. About seven or eight hours of such fumigation will destroy pests of all sorts, and if done at night it will be found by next morning to have cleared the house. It will then be ready for cleaning after the house has been well aired by leaving the ventilators wide open. All sash bars and wood-work should be washed down in soap and water, and opportunity ought to be taken after the wood is dry to do any puttying and painting needed before any plants are brought indoors.

MIDLANDER.

Sedum spectabile

This is the true Japanese Stonecrop, worthy of a place in any garden, especially if it can be given a shady spot. It is a favourite old plant with many, thriving in quite ordinary soil, but liking best one in which humus is prevalent, such as that in which is placed occasionally old manure or well-decayed vegetable refuse. As is known by those who grow it, the leaves are broad and glaucous, borne on erect stems, and the rosy-purple flowers, which appear at the extremities of the shoots, come in early autumn and last in good condition for some weeks. It is a plant which stands cold with impunity, hence those who thought that last spring, when so many things were cut off by frost, it would surely kill this Sedum, were agreeably surprised to find, although late in appearing, that it eventually pushed its shoots out of the ground, and this year promises to bloom just as freely. Roots can be planted in late autumn, but spring is an ideal time for removal. MIDLANDER.



Half Peach, half Nectarine!

A Peregrine Peach tree bearing one fruit, indicated by an arrow, the top half of which is identical in appearance with that of Humbolt Nectarine. The demarcation is clearly defined along the suture of the fruit from the stem to the nipple. All other fruits on this Peach tree were normal. It was a well-fruited tree shown by Mr. J. C. Allgrove. Incidentally, it might be observed that the Nectarine first occurred as a sport from the Peach. The flavour of the Nectarine is distinct from that of the Peach, and it is only on very rare occasions that such a sport has been recorded

A Random Commentary

THERE was a slight feeling of waiting for the tide at the last fortnightly show in Greycoat Street, as though the summer flowers were over and the autumn season had not yet begun; but this impression was partly attributable, no doubt, to a natural reluctance on the part of nurserymen to stage expensive and elaborate exhibits when there were so few people in Town to see them. Yet although the number of exhibits was small, there was nothing perfunctory about them. Messrs. Sutton showed their China Asters perfectly and competently so as to bring out their quality to the full, and they are flowers, as most people will agree, which are best in their own company.

The Dahlias gave a remarkable exhibition of docility, some of them looked as though they had stepped off the dust cover of a lurid novel, while the exquisite little Pompons took on the tender shades of a melting strawberry ice, *bois de rose*, or palest fawn, while one of them whose petals were of pale yellow edged with red and faintly bloomed over with lavender, looked like a piece of Dresden china which had caught the glow of an Alpine sunset. One Cactus Dahlia was quite hideous, with a greenish-yellow centre and tentacles of sickly pink; but there were very few ugly Dahlias to be seen, which does credit to the taste of the raisers, for the Dahlia seems to have no will of its own, and can be as ugly as anyone cares to make it.

Dahlias, Asters, and garden Roses not only lend themselves to exhibition, but positively ask for it. On the other hand, the shrubs shown by Messrs. Notcutt needed a close examination to reveal quality. It must be very difficult to show flowering shrubs in a way as to suggest their full beauty; it might be done, one sup by giving a specially chosen vase and ample space to each spe branch, but few exhibitors can afford to sacrifice the square feet al to them, which they must use to illustrate as many good items their catalogue as possible. One good item was Romneya hy which has the effect of R. Coulteri, but is said to be more co and orderly in its habit of growth. Another was Abelia Schuma with large flowers of pinkish lavender and a spicy scent. It s to ask for a warm corner or a specially favoured locality, wh well deserves for a refinement that is not common in its fa Perofskia atriplicifolia is said to cover far too many miles of co in the Southern States with Sage Brush, but it is all too s seen in this country, where its white stems and leaves, into the intense violet of the flowers finds its way, are strikingly bea to our unaccustomed eye.

The plants illustrated on this page and on the page opposite were shown at the Royal Horticultural Society's fortnightly meeting held on August 27th

Hedychium Gardnerianum with about 120 flowers!

-fashioned Pom-pom Dahlias were
e in particular being Glow.

easing exhibits were those of the
ration, some with one variety and
y, and others with two or more
f flowers and colours, but the chief
his exhibit was the fact that the
e too crowded, consequently giving
y appearance.

ut not least, children are en-
n this great scheme to beautify London, and the Kensington Schools staged a group of flowers grown by school children. After visiting such a remarkable exhibition one felt that there was not very much wrong with the London soil, for London's Flower Show has proved a great success.

The Western Catalpa (C. speciosa)

The Catalpas are blooming rather freely this year, and a few days ago I saw a very handsome specimen, 30 feet or more in height, laden with beautiful flowers. The panicles are about 6 inches in length, while the individual flowers, resembling a Streptocarpus, were each over 2 inches across, white, with yellow throat, and streaked with purple, each flower prettily frilled. The handsome, soft green leaves were a foot in length and 6 inches in width. The tree was growing in a moist, sheltered valley bordering a Sussex woodland, the occasional bursts of sunshine at the time of my visit lighting up its flowery head to great advantage. We possess a few young, healthy trees of this species, but they have yet to attain the flowering stage, which, judging by their rapid growth, should not be far distant. Catalpa speciosa is a native of the Southern Central United States, and was introduced in 1880. C. S. Sargent, in his manual of the trees of North America, mentions this tree as reaching 120 feet high in the forest, its timber being much used for fence posts, rails, telegraph and telephone poles, and occasionally for furniture and the interior finish of houses. Gate posts have been known to stand in perfect preservation 50 to 100 years, according to Mr. W. J. Bean, such is the remarkable enduring quality of its timber when sunk in the earth.

E. M.

David's Lily (Lilium Davidii)

This graceful and refined Lily is now blooming with me and promises to become a permanent occupant of the garden, having endured the two past winters safely and unprotected. It increases in strength with each succeeding year. The tallest plant here is about 5 feet in height and carries 17 flowers and buds. The flowers, each about the size of a Tiger Lily, are of a soft orange shade, with many black spots, the rather pointed segments spreading out and curling back, and the flowers being nicely spaced on the stem. In many respects this charming species resembles a Tiger Lily, but it is more refined, less woolly about the stem, and without bulbils in the leaf axils. It flowers during the third year from seed. With me it is growing in a bed, the soil of which is composed to a large extent of leaf-mould and surface woodland material.

Sussex. E. MARKHAM.

China Asters

The great points in the successful cultivation of Asters are to give them a very rich soil at all stages, and never allow the plants to receive a check in any way. Plant out carefully into beds of good, rich, and deeply dug soil. From 8 inches to 10 inches apart is a good distance for the dwarf kinds, and 1 foot or more for the tall growers.

Ten Days in Leventina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

At the request of many readers, this diary is continued over a slightly longer period than was originally intended

(*Continued from page 582*)

Botanising with a Barometer — The Climb to Lago Dentro

SUNDAY, JULY 7TH (*continued*).

WHEN I got back to Hotel Piora in the evening the contents of my vasculum soon aroused the curiosity of a party of new arrivals from England—not the least of the charms of Piora is the number of interesting people one is sure to meet there. Although less than two dozen in the hotel, the guests included botanists, entomologists, geologists, ornithologists, in addition to those who were on their way to the Cadlimohutte for climbing, and those who had come for trout fishing.

To return to the contents of my vasculum, which were tipped out on a table, the flowers of the White Martagon and the bulb of the Black Martagon thrilled the botanists to the core, and those, together with the five-leaved Paris quadrifolia, formed the chief topic of conversation.

The pioneer of this very select party was a doctor, a tall man, of athletic build. From Lilies the conversation turned to Campanulas, Primulas, Gentians, and Androsaces. Two plants that the doctor seemed most anxious to find were Androsace helvetica and Linaria alpina alba. He was obviously an enthusiast in albinos. The next question fired at me somewhat suddenly was, "Have you ever seen Allioni alba?" Much to the astonishment of the doctor I was able to say that I had seen it, both in cultivation and in the wild state in Nature. I had visions of limestone cliffs in the Maritime Alps, where the rare Primula Allioni grows, tightly wedged in the hard, whitish rock. I had seen it there and the white form not many miles from San d'Almazzo di Tenda. To my dismay my reply was received with very grave doubts, not only by the doctor, but also by his gardener, a stout and trustworthy man, who accompanied him. Could it possibly occur at so low an altitude? The doctor shook his head as only a doctor can. I referred to the type plant as being very rare—doubtless a dying species—to which the doctor replied that it grew by the acre, and he could name at least twenty stations for it. The discussion grew heated, and some guests in the hotel, including an old gentleman with a butterfly net, expressed astonishment that two Englishmen not known to one another could get so heated over the natural distribution of a harmless flower, which after all was only there to attract moths and butterflies. Never before had I been involved in such a discussion; our views were irreconcilable. I would not give way, though I carefully avoided disclosing the exact whereabouts of a plant which I knew to be so very rare and much sought after by collectors.

MONDAY, JULY 8TH.

Early this morning I met the doctor on the staircase. "Ah!" said he, with light in his eye that comes only by inspiration, "I've been thinking that we were at cross purposes last night. The plant you had in mind was Primula Allioni alba." "Certainly," said I, "what else could it be?" "Well," said he, "I did not mention the genus Primula, the plant I was discussing, was Campanula Allioni alba!" Thus our confusion ended.

[N.B.—Can any reader throw light upon the whereabouts of Campanula Allioni alba? This plant occurred as a seedling in Dr. Jenken's garden at Hindhead, but so far as I know there is no record of it having occurred anywhere in the Alps.]

My new acquaintance proved to be Dr. Jenken, with whose name I was at once familiar; indeed, he is known throughout Europe and beyond to enthusiasts among Alpine plants. Had I not seen wonderful pans of Gentians from him at Vincent Square, and other treasures from him in the Alpine House at Wisley?

Luckily for me I was able to join the doctor's party for Lago Dentro and the heights of Tanedo. Moreover, I hoped that if snow had cleared sufficiently we might get through to the Cadlimohutte.

The doctor, I observed, was
methodical. Before leaving the ho

s a neat subject for carpeting the
partially shaded places in the rock
may be grown quite well in well-
sitions on the flat, but it is seen
etter advantage when growing on
lope about the level of the eye.
Like most New Zealand plants, it is hardy only in sheltered positions in the more exposed parts of the country, but in the south and west it survives the winter unscathed. It succeeds best in moist districts, covering the ground with its creeping, slender, matted stems, clothed with rather thick, coarsely toothed leaves. Its numerous white flowers, similar to those of a dwarf Lobelia, are produced in autumn, followed by violet-coloured berries. This plant appreciates a soil of a vegetable character, such as peat and leaf-soil, to which a little loam and sand is added. Grown in fairly large patches it makes a pretty and charming sight. J. L.

Ranunculus glacialis flowering freely in the water from the melting snows at Passo dell Uomo leading to Santa Maria

Potato blight

Although the country is remarkably clear of Potato Blight this season so far, it is only right and prudent to carry out the spraying programme as intended; the disease is almost certain to come along later.

Bordeaux Mixture is usually employed, and is preferable to powder, which is only used where there is a shortage of water. It is made with 4 lbs. of copper sulphate, 2 lbs. of quick lime, and 40 gallons of water; enough for one-third of an acre. The 4 lbs. of copper sulphate is dissolved in about 35 gallons of water, and the 2 lbs. of lime slaked slowly and separately, the other 5 gallons of water being added to it, stirring all the time. The 5 gallons of lime-water is then strained through a fine sieve and added to the 35 gallons of copper sulphate solution, the whole being vigorously stirred in the process. This mixture will cost about 2s. The cost of spraying an acre once is put at 5s., and if three sprayings are made and Potato Blight thereby kept away at a cost of 15s., the extra crop per acre will probably be not less than 1 ton. If the mixture is bought ready-made, or if powder is used, it should be seen to contain not less than 15 per cent. of metallic copper.

Martineau and Smith, of Birmingham, make an excellent spraying machine suitable for the purpose.

REMINDERS FOR THE WEEK

Southern and Midland

Lavender

Hedges and large groups of this favourite shrub, both tall and dwarf, will, if inclined to become thin and worn at the base, benefit from a rather severe cutting back at this season. Young growths will then develop lower down and the plants become more bushy. If it is necessary to renew any of these or increase one's stock, the present is a good time to do so by tearing off healthy young shoots of the past season's growth, with a heel attached, and inserting them very firmly in sandy soil, either in the open or on a partially-shaded border, where they will soon root and form nice bushy plants for next season's planting out.

Propagating Trees and Shrubs

The majority of these may now be propagated by means of the sand frame, now so popular and valuable. Both evergreen and deciduous species may be attempted, using cuttings made of partially-ripened wood, and taken from the plants or bushes with a heel attached. The heel is not absolutely necessary, and many strike freely if cut below a joint, but it is advisable to remove with a heel where possible. Those who do not possess a sand frame for this purpose should get a fairly deep box (about 14 inches or so) and place therein 5 inches of clean, sharp sand. Cover it with glass, the important point being that of keeping it airtight. If damped over frequently no shade will be necessary this year.

Furnishing summer beds

Pentstemons, Snapdragons, Calceolarias, Evening Primroses, Tufted Pansies, Veronicas, and Mesembryanthemums used for the furnishing of summer beds must now be taken in hand, and cuttings about 4 inches in length inserted in boxes filled with sandy soil in quantities. These will strike freely in cool, closed frames if dewed lightly over to prevent wilting in the afternoon following sunny days. Too much moisture, however, must be guarded against, or damping will set in.

Prepare Carnation beds

Prepare beds in readiness for the planting of Carnations, which will shortly be ready, using a little old lime rubble in soil which is inclined to be heavy, or, failing this, freshly-slaked lime will do. Seedlings of good kinds raised in March are ready now, and should be planted without delay, but those which were layered will require a little longer before being lifted from the layering ground.

Sweet Peas

Prepare the ground by deep trenching, enriching same with manure and a little lime in readiness for these, which, to obtain the best results, should be sown before the 20th of the month. A little fresh maiden loam, to which has been added a sprinkling of wood ash and bone-meal, should constitute the upper foot of surface and be brought to a fairly fine tilth.

Strawberries

The ground having been prepared earlier and allowed to settle down, is now ready for the young layers, which should be planted without further delay. A very good distance is 2 feet all ways between the plants, and it is essential to plant firmly with a good soaking afterwards. Those intended for forcing should be placed in their fruiting pots, and stood close together on a bed of ashes in full sunshine.

Apples and Pears

The early varieties require almost daily attention if they are to be used at their best, and fruits gathered so are preferable to those taken in bulk, as so many of the latter are deficient in quality before they can be used. Plums, too, should be gathered daily where several varieties are grown.

Raspberries

Encourage growth by liberal applications of weak manure water, as these plants, being so shallow rooting, suffer quickly from drought. Remove all old canes where not already done, and thin out the young growths in order that sunshine and air may penetrate and harden the remainder. Perpetual varieties are cropping abundantly.

Potatoes

Lift and store second earlies, as no object is gained by their remaining longer in the soil. These are very fine and clean this year, as are all this group, at least, in this district, and I do not anticipate any great losses in future, as disease appears to be non-existent.

Lettuces

Make a final sowing of Trocadero, Hardy Winter White, and Winter Beauty, to plant out later in cold frames, and on sunny borders protected from easterly winds. These will prove a boon in the early months of next year when salads are scarce.

The fruit store

Cleanliness is most important here, and before the heavy supplies are ready for storing both walls and woodwork should be thoroughly cleansed and limewashed.

E. MARKHAM.

Scotland

Propagating bedding plants

This matter demands considerable time at this season and should not be unduly delayed, for even the hardier subjects are, to say the least of it, not improved by being frosted before the cuttings are secured. It is getting just late enough for the more tender kinds, but if secured now and the boxes or pots of cuttings set in a slightly heated pit or other glass structure and kept close and shaded, rooting should eventually take place.

Pansies and Violas

As has frequently been mentioned in these columns, these popular dwarf plants have suffered very considerably with the prolonged drought. Where cuttings can be secured, now is a good time for inserting them. Only the young shoots that spring up in the centres of the plants are of much use as regards cuttings, and sufficient quantities of such should now be taken off and dibbled into a bed of sandy compost under a cold frame. These cuttings succeed all right in ordinary cutting boxes if these are set in a cold frame.

Pentstemons

Best results are had with this fine plant by propagating annually at this time. Side shoots that show no sign of flower-buds in the points are by far the best for this purpose. From 4 inches to 5 inches is a suitable length for these cuttings, and many of them may be secured with a slight "heel," which is a great advantage, although shoots of good, firm growth, not too thick, if cut through close under a joint, make excellent cuttings, given decent treatment. While the cuttings may be placed in boxes, they succeed much better when a bed of fresh,
compost is made up for them under
frame.

Plant Daffodils

The earlier now these are plant
better, especially when the site is in
land or under trees. When planting
garden, be careful not to put any fresh
yard manure into the soil, this material
absolute poison to many of the varietie
unnecessary in any case. Should the

ddition to the spring character of
makes for a remarkable effect.
a Hollies are quite hardy and more
gorous and robust in growth. Any
len soil suits them, although they
certainly thrive best in deep, good loam of a rather light or sandy character. Provided there is a sufficient depth of soil, they do admirably on a dry bank. The dwarfer kinds, such as E. Bourgati, do well with me on the rockery. The best time to plant is in spring, about April as a rule, and increase is usually by division. Most of the best kinds, however, may be raised from seed. A few good species are E. maritinum, E. amethystinum, E. giganteum, E. alpinum, E. Bourgati, and E. planum. F. H.

Azalea Daviesii

Hiawatha Rose

Roses come and go. Some are heard of for a few years, and then they fall into line with many others possessing qualities nearly alike. Some seem to retain their special points which made them popular at the time they made their debut, and are not forgotten easily. Hiawatha is an instance of a Rose that is a good stayer once its cultivation has been entered upon. As is well known, it is a single sort, crimson in colour, with golden anthers. When these drop they leave a white centre visible, and as it blooms in clusters it is a favourite for arches and pergolas. I do not know of any crimson rose that lasts so long in a good state as Hiawatha; indeed, I question if there are many which last nearly as long. Four weeks I have had the clusters in good condition, and in some seasons beyond this time. Its continuity of flowering is one of its distinguishing characteristics, and those who have not included this sort amongst their climbers should plant one or more this autumn. MIDLANDER.

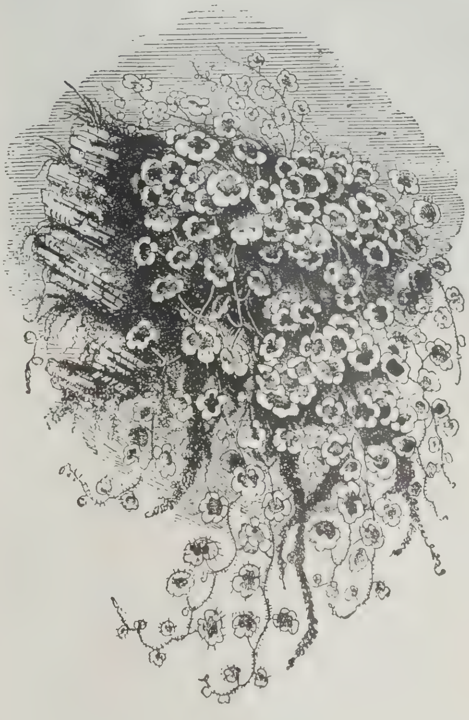
A native American Azalea in a West Surrey garden

From Gardening Illustrated

Fifty Years Ago

The variegated Cornish Moneywort

THE Cornish Moneywort is a modest little plant, long grown in ferneries and among Alpine plants, owing to its graceful form and interesting character as a British plant. Nevertheless, not possessing any brilliancy of flower it has never become a very popular plant. Its delicate fresh green, however, and the facility with which it grows in any place where hardy Ferns succeed should make it more popular. We have seen it thrive vigorously in a London area, the plant falling down and draping the pot with a mantle of charming verdure. In a wild state it creeps about in shady places, the banks of rills, and like positions along the western coasts of Europe, extending as far north as the southern parts of England and Ireland. It is found also in the Channel Islands. This comparatively new variegated form is likely to be much more popular. Its leaves are prettily margined with white, and this marking seems in all cases regular. Our illustration, however, gives a good idea of the variegation and general character of the plant. It will probably, in addition to the purposes for which the green Sibthorpia is grown, be found desirable for surfacing pots and baskets in the greenhouse and fernery, and for concealing pots and other objectionable surfaces, its dense mantle of leaves keeping very close to the surface and the growth being of such a nature that it will not rob the soil of the nutriment required by other plants.—*September 6th,* 1879.



A peril near home

Lately grave cases of poisoning by supposed Mushrooms gathered in Hyde Park and Regent's Park have fallen under treatment at Middlesex Hospital. The symptoms were urgent, and included violent delirium, though happily the patients recovered under treatment. This is a matter of general interest, because it is quite possible that some of the Mushrooms supplied by costermongers, and even family greengrocers, may be obtained from the same localities; and it is by no means so easy as is generally supposed to distinguish the genuine edible from the poisonous fungi. The public should be warned.—*October* 25, 1879.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FRUIT

Diseased Plums

(T. C. C.).—We have examined your Plums, and although most of the small, black creatures had escaped during the journey to our office, we were able to find two of the specimens. These are a species of Mite which usually live freely on Plum and Apple trees. So far as we are aware, the creatures are quite harmless, and your finding them in the hole "where the stem was" is just a coincidence. The Plums you sent were affected with Brown Rot, and this fungus was the cause of their dropping off. It is usual for fruits attacked by Brown Rot to remain attached to the tree, but the wind you mentioned probably fetched them down. Please see reply to "Puzzled" in this week's issue.

Apple trouble

(North Countrywoman).—We hav amined the soil and also the specimen Red Spider is certainly part of the t but not all. To deal with the spider p first get a supply of the insecticide Vol use it according to the makers' dire Apples on south walls are frequently t with Spider, and, bearing this in thorough syringing during the growin son should be given, and if this pro sufficient fall back upon a good insect control the spider. We are som troubled by the fact that you say wate not get away easily from the roots o trees, and we fear that defective root may be part of your trouble. From y scription of the "lay" of the site it seem easy for you to put in a drai would ensure the water getting Apples do not like badly drained soi notice that the foliage shows signs of shortage, and also that the soil appear one in which little potash is presen advise you to apply this autumn an mixture of kainit and basic slag at t of 8 ozs. per square yard. Dress t several yards out from the wall and n the base of the trees. Write again if assist you further.

Vine mildew

(W. P. P.).—Vine mildew can b trolled, but it is essential that the measures be adopted before the fung made much headway. We can und that you failed with your sprays. Y not start early enough in the season. mildew is caused by a fungus. Wh fungus is present its spread is more under certain atmospheric condition cultural details play a big part as to or no the trouble becomes epidemic lect and burn as much of the d material as you can. Give the hou Vine a thorough clean-down this wint former with hot water and carbolic so latter with Gishurst Compound. growth commences next year ob Campbell's Sulphur Vaporiser, and u apparatus from time to time throug year's growing season. If no sign of shows itself you can safely wait unti 12 days before the flowers open. when in bloom and again at interv you can keep the disease away for o you should have no more trouble w fungus unless you reintroduce it. An horticultural sundriesman will supp with Campbell's Vaporiser. Full tions are issued with the apparatus.

Apple scab

(E. H. K.).—The only successful for the fungus causing Apple Scab is t with either lime sulphur or Bordeau ture. We cannot agree with your st that spraying is useless, but we d with the statement if you add "und tain conditions." The conditions which spraying is useless is when the spray is used or the right spray used wrong time. To obtain control of the it is essential that the trees are spraye the pink bud stage, (2) when most petals have dropped from the flowe three weeks later. If the spray fluid plied at the above three periods ther difficulty in obtaining control. Furth effect of spraying is cumulative, so th a spraying programme has been carr for several years more and more co obtained. We can understand the e the farmyard manure. This wou courage the trees to make more le wood growth, and therefore the fung cerned had more area over which to itself, a condition of which the fungus

o take advantage. In addition to
your usual manures you should give
e of potash at the rate of from 3 cwts.
vts. per acre. This material would
harden up your growth and enable it
t disease. There is no treatment of
l which will enable you to control
icab. Lime is good for fruit trees on
turally deficient in lime. If you can-
end on your gardener doing the spray-
perly a change would seem desirable.

n five or six buds of their base and
he leading growths made during the
year to within 6 inches or 8 inches
of their base. The centre of the bush should be left even more open than the sides, as growth always tends to fill up the centre. February or early March is the time to prune. Properly cared-for bushes may be kept for many years, 10 or 15 years being quite usual. Spring Cabbage should be sown in the south of England on July 27th.

VEGETABLES

Diseased Potatoes

(Weybridge).—Your specimen Potatoes are affected with Surface Scab, due to an attack of the fungus Actinomyces scabies. It is probable that the "seed" was quite free from this disease. The fungus concerned is one which is very generally distributed, being present in almost all types of soil. Under normal conditions the fungus lives on decaying matter in the soil, but when organic matter is in short supply and Potatoes are grown the fungus turns its attention to the Potatoes, attacking them, causing the well-known "Scabby Potatoes." This explains the fact that Surface Scab is always most prevalent in light soil, such soils being notoriously short of organic matter. From the description of your soil we gather that it is of a light, gravelly nature, and this being so we should expect that this disease would be prevalent. The control for Surface Scab is the addition of plenty of organic matter to the soil. Research workers have shown that clean Potatoes can be grown on bad "Scab" land by the addition of lawn grass cuttings at the rate of 20 tons per acre. Almost any organic matter will answer the same purpose. Your best plan will be to lift the crop so soon as the skin is set. Dry them thoroughly by allowing the crop to remain in the sun for a few hours and then store. If this is done you will find that the crop will keep well, and the "Scab," after all, only spoils the appearance of the tubers until they are peeled. When the crop has been lifted try sowing a crop of Mustard broadcast. There may be just time for this crop to grow and make enough top to dig in as "green" manure. If you could obtain a fair growth of Mustard and dig it in it would help the organic content of the soil to a great extent. No matter what crop you intend to put on the land next year the supply of this organic matter is one that requires attention before you can hope for much success. The cow manure was quite in order, and it has had nothing to do with the Scab. Your land is short of organic matter, and your need is to make up the deficiency by adding farmyard manure, garden rubbish, or by growing a crop and digging it in as manure. This information has been given you by your growing the Potato crop, so that the experiment was worth while, because you may have tried to grow many other crops before you found out the real cause of your soil not producing exactly what you hoped for.

Tomatoes of good flavour wanted

Could you tell me of a Tomato with a really good flavour. I am tired of growing beautiful looking fruit, so appetising to look at, but so disappointing when eaten. I am told that the yellow varieties have more flavour. Is this so? H. F. S.

Yorks.

[We hold a very high opinion of some of the yellow varieties, and would draw your attention to Chiswick Peach, Yellow, and Orange Sunrise, the latter one of the finest flavoured Tomatoes in cultivation. Webb's Jewel (red) and Bountiful (red).]

TREES AND SHRUBS

Copper Beech

Each autumn I generally add a tree or two to my garden, as need arises. This time I wish to add a little colour, for instance, Copper Beech, but in looking over my catalogue I notice only Purple Beech is listed. In this district I have noticed a very dark purple and a red or reddish copper colour, brighter, and the latter more the shade I wish. Does the latter have any distinguishing name for use when ordering to get what I desire, and can you suggest a likely house who stock same? In your issue, January 12th, page 24, I notice an article on grouping different coloured foliage trees for effect. Scarlets and purples in Geans are mentioned. Is the latter a local name, as I cannot find any trees listed as Geans? I notice a tree on an estate here with blue-grey leaves and very white on the underside, and when rustled by the wind it looks very striking. Would this be the White Beam or Service Tree mentioned in the article? My most striking foliage (colour) trees are Cedar atlantica glauca and Acer negundo alba variegata, also atropurpurea, but I would like more contrast. I have Poplars, Black Italian and Lombardy. Would the Abele Poplar mentioned, also Norway Maple, give me more variety (in colour)?

Near Birmingham. A. G. BRADY.

[Yes, the two are quite distinct, the name of the Copper Beech being Fagus sylvatica cuprea, and the dark purple form to which you also refer is Fagus sylvatica purpurea, the leaves of the former being of a coppery red, whereas those of the latter are deep purple when mature, but in spring of a beautiful pale red. The Gean is our native Wild Cherry, Prunus avium, Gean being the common name. This beautiful tree in spring, when laden with bloom, and again in autumn, when its leaves turn fiery red, is a sight to behold. From your description, the other tree you mention would probably be the White Beam (Pyrus aria) remarkable alike for its leaves, flowers, and fruits. The Norway Maple (Acer platanoides) and the Silver Maple (A. dasycarpum) and A. ginnala are all beautiful subjects, and with regard to the Poplars you could scarcely surpass P. canescens (Grey Poplar) for effect, or P. trichocarpa for fragrance, both winter and summer. We also suggest the following:—Abies nobilis, A. pungens glauca pendula, Cupressus macrocarpa aurea, Cupressus lawsoniana lutea, Carya tomentosa, Ginkgo biloba, Quercus coccinea, Pyrus arbutifolia, Parrotia persica, Liquidamber styraciflua, Nyssa sylvatica, Liriodendron tulipifera, also a few of the gorgeous Vines such as Vitis coignettiæ, V. vinifera purpurea, V. Engelmanni, etc. All the above are offered by Messrs. Waterer, Sons, and Crisp, Twyford Nurseries, Berks.

Oak tree losing condition

(Mrs. L. Knox).—If your Oak is carpeted with grass the latter should be taken off for a distance of 6 yards from the trunk all round, laid aside, and the soil dug out and removed to a depth of 1 foot. This should be replaced with good maiden loam, adding one cartload of farmyard manure to every six cartloads of the loam, solidified by ramming, and the turf replaced. This would vastly improve the condition of the tree. Failing this, apply a dressing of bone-meal or Peruvian Guano, at the rate of 3 ozs. to each square yard every five weeks until three dressings have been given, watering it in thoroughly should the weather prove hot and dry. Drainings from farmyards (diluted) are also excellent for bringing colour and vigour back into trees.

Shrubs not flowering

I should be so grateful if you could tell me why these three shrubs (samples enclosed) do not flower. (1) Drimys Winteri; (2) Carpenteria californica; (3) Magnolia species. They are all healthy looking, in a sheltered shrubbery—perhaps too crowded and too shady. (1) is about 12 feet high. Other Magnolias flower well. S. M. M.

Co. Cork.

[(1), (2), and (3) are all lovers of abundant sunshine and should bloom freely every year. Cease all pruning if you are in the habit of doing so, and expose all to full sunshine and they should bloom in due course. The Magnolia is probably M. soulangeana.]

Shrubs for naming

(S. M. M., Co. Cork).—Small-leaved shrub not recognised. No. 1, evergreen climber. This is Tacsonia mollisima, and the shoot sent is covered with scale, the latter responsible for the dirty black surface of the leaves. Instead of fumigating, spray the plant frequently with paraffin soap as sold by horticultural sundriesmen, who give directions for its use (it is also offered as paraffin emulsion). The spraying should take place in the evening or early morning, when the sun is not upon the plants. The scale will spread upon all plants brought near unless it is destroyed. It would do no harm to prune it back hard during the winter, and when this is done it should be sponged all over with the paraffin soap. In this way you ought to get rid of the pest altogether.

Evergreens for conservatory, and depth of soil for same

(S. M. M., Co. Cork).—Rhyncospermum jasminoides, R. japonicum, Clematis indivisa, Lapageria alba and rosea, Streptosolen Jamesonii, Mandevilla suaveolens, Sollya heterophylla, Clianthus puniceus, Acacia Baileyana, Abutilon megapotamicum, Allamanda Hendersoni, Lonicera Hildebrandtii, Asparagus racemosus, Beaumontia grandiflora, Hoya imperialis, Ruscus Androgyna, Stephanotis floribunda. Two feet of good, rich, and well-drained soil will be sufficient for any of the above.

GREENHOUSE

Plants for decoration

By next Easter I want to have as many plants as possible for house decoration. Will you please advise me how to set about it, and when? I have a small greenhouse heated with a slow combustion stove, and I try to keep the temperature about 60 degs. I am not particular as to colours. White flowers are not specially required. HELIOTROPE.

[By the date mentioned it should be quite easy to obtain many things in flower, such as Marguerites, Azalea indica vars., Azalea mollis, Heliotrope, Mignonette, Hydrangea, scarlet Geraniums in plenty, and many bulbous things, such as Tulips, Hyacinths, and Narcissus, that would, if potted and kept cool, come into flower more or less naturally at the time required. But getting these things into flower at such a time will depend not on one thing or two, but many. For example, we have no proof of your stove maintaining the heat you mention, and its failures may bring not a few things to grief. Your wisest course will be to grow a few things and feel your way. Say you go in for Zonal Pelargoniums, of these, if you had a couple of dozen small plants in 3-inch pots, you could pot them into 5-inch, and make them very firm. Water sparingly, and pick out the flowers until the end of January. Such plants on a light, warm shelf in the greenhouse would make nice bushes. A similar remark would apply to Marguerites and Heliotropes. The Azalea indica, well budded, may be brought in now and grown on in the greenhouse, while the A. mollis kinds should be potted up during October and put into the greenhouse in the middle of January. Hydrangea the same. Spiræa japonica, Solomon's Seal, require starting in January in warmth, and Mignonette. Acrocliniums should now be sown in pots of 5 inches or 6 inches across. For two months longer these would do in a cold frame with any Tulips, Daffodils, Hyacinths you like to grow. Some bulbs of Lilium longiflorum would flower if potted at once. Then, again, there is the Arum Lily, an indispensable plant for the purpose that, given strong plants, would hardly fail to be in bloom. The bulbous plants would naturally require some watching, and may need forwarding in the last days, or perhaps retarding or only shaded. To the plants already named you would require some foliage subjects, such as Ferns and grasses. Of the former, Maidenhair, Asplenium bulbiferum, Pteris tremula, P. serrulata vars., these and a few Eulalias, Araucaria excelsa, would make a useful variety for your purpose.]

ORCHIDS

Orchid leaves

("Gardener").—There appear to be no vermin attacking the leaves sent, and so most probably the damage is caused by some mistake in treatment. Exposure to the sun, syringing with "hard" water, sponging or syringing with too strong insecticides are all likely causes. The addition of some Sphagnum Moss to the peat with which the Orchids are potted might be a help to the plants.

ROSES

Roses of a climbing nature in pots

Between the Rose garden and a rather ugly part of the house is an area of concrete. We want to stand on this some large pots or boxes and grow Roses in them to hide or relieve the ugliness of the house. Would you kindly indicate some Roses suitable for this purpose and give details of treatment of the contents of the pot? (Also treatment of the trees themselves if it differs from the ordinary.) No glass of any kind is available. Needless to say, ramblers would be more convenient than bushes. Are most ordinary garden Roses amenable to this kind of treatment? "S. S."

Waylands.

[We advise you to use half-barrels for this, as, apart from their greater soil space, there arises the question of frost, which might split pots in winter. Suitable soil consists of the following:—Turfy loam three parts and one part made up of well-rotted manure, a little bone-meal and lime-rubble, the whole made moderately firm. The tubs should, of course, have holes drilled in the bottom and should receive a layer of crocks over the base for drainage. Most Roses are amenable to this method of culture, but owing to the confined space do not make the same amount of growth as when planted in outside borders. The following are desirable kinds:—Mermaid, Cupid, Flora Mitton, Mrs. Rosalie Wrinch, Paul's Scarlet Climber, Alberic Barbier, Lady Godiva, Climbing Lady Hillingdon, Climbing Mme. Abel Chatenay, Lemon Pillar, Mme. Alfred Carriere, Sarah Bernhardt, Una, Tausendschon, Dr. W. Van Fleet, Emily Gray, Excelsa, Hiawatha, Leontine Gervais, and Yvonne.]

FLOWER GARDEN

Plants for streamside

My garden is bounded on the east side by a stream about 2 yards wide. I have built a rough retaining wall against my bank so as to form a border about 2 feet wide just below the top of same. I thought of planting some Primula japonica and moisture-loving Iris in this border. Can you advise me wha would thrive there? I should say th opposite bank is densely screened by El Beech trees, fully grown, which kee morning sun off my side to a great also that the stream when in flood (it is dry now) comes practically to the top wall. "WATERL

[The following would thrive in the p you mention, providing the shade dense:—Iris aurea, I. Delavayi, I. leuca, I. Monnieri, I. sibirica in vari Kæmpferi in variety, I. chrysographes Lilies (Hemerocallis) in variety, Flowers (Trollius), Primulas, all the growing kinds, such as P. Florind japonica, P. pulverulenta, P. Smithia helodoxa, P. cashmeriana, etc., and of the smaller kinds, Kingcups, inc Caltha Tyermanni, C. polypetala, palmata, Senecio Veitchianus, Lysi vulgaris, Lythrums, Mimulus luteus, C longus, Saxifraga peltata, and Os regalis (the Royal Fern)].

Anemone Alpina

(N. Y. L., Tunwells).—The plants be put out about the first week in A full sun and in a well-drained but light soil. Good loam three parts, wi part made up of leaf-mould and san suit this plant admirably. Anemone is not a difficult plant to grow.

Fasciation of Heleniums

(W. J. O.).—Would you like to sen specimen of your fasciated Heler After actual examination of the specim might be possible for us to tell you a the cause of the fasciation. In most fasciation is caused by injudicious f the plants obtaining thereby too muc material. A plant so fed has its equil disturbed and behaves abnormally. this occurs it is usual to find the whol affected. However, fasciation fre occurs in a single branch or flower of a and some cause other than over-feedin be operating. A fungus invading the of a plant so that the normal transfer food material from one part of the p another is a frequent cause of ab growth, which may reach the stage of tion. The bacteria disease, Crown G quently causes fasciation in certain Injury to growing points by animals, mites and insects, is another frequent of fasciation. If you could send a sp we could at least advise you whether was advisable to destroy the plants.

Diseased Phlox

(C. I. M.).—The specimens of Ph affected with Phlox Stem Canker, a which seems to be especially prevale season. Control of the portions actu fected is impossible, because the fung deeply in the tissues and it is imposs apply a fungicide strong enough to r Go over the plants and cut away all th affected. The healthy parts should be with a weak solution of lime sulphur. year an occasional soaking with a solu Cheshunt Compound would help you trol the disease. This solution should plied early in the season, and if the afterwards shows any sign of its p the affected parts should be cut away healthy portions sprayed as above. plants frequently fall into a low vitality by keeping the clumps grow long in the same situation. To k plants healthy they should be repro fairly often. Cuttings taken in sprin the growths are about 2 inches in leng good method of raising plants. The c should be dibbled into cold frames and from bright sun until rooted. When s should be hardened off, planted out ummer to strengthen in nursery bed, into flowering quarters during the autumn or spring.

nula Rust

Hodge).—Your plants are affected mpanula Rust, which is caused by the Coleosporium campanulæ. The ortions are the uredospore stage of se, and these spores remain attached ants or on the soil nearby and attack ampanulas next season. If the s as bad as you say, it would seem to burn them all and not to attempt ulas in the same part of the garden r. In any case you must cut away attacked portions and burn the material; any apparently healthy could be sprayed with a weak solu- ver of sulphur. This control should, e, have been adopted earlier in the Spraying with a weak fungicide as tative would be advisable another

Sargentiæ

years ago I was given some Lilium æum?) bulblets which have grown y, but I now feel doubtful as to ng Sargentiæ, as I cannot find it any of my lists. I should be most if you would enlighten me as to hape of flower, etc., of this variety.

SARGENTIÆ.

n Sargentiæ, a Chinese species in- by Mr. Wilson some years nd originally distributed under the L. Browni leucanthemum, is a mag- species which attains a height of 5 feet when established. Flowers ral habit are between L. regale and ureum. Funnel-shaped, milk-white , suffused golden yellow at the base. y, deep wine-red or reddish-brown, an regale, and flowers ten days to eks later, but is usually over before flowers of L. sulphureum open. o reason why your Lily should not be the true L. Sargentiæ. The fact g bulblets points to its being either ntiæ or L. sulphureum, as these are two funnel-shaped Lilies to produce n the leaf axils. The true charac- plant is hardly to be expected from ee to four years old.]

MISCELLANEOUS

Bug

—At this time of the year your best be to obtain a good insecticide and cording to the makers' directions. his treatment by using calcium uring the dormant season. Full de- the correct dosage and manner of n can be obtained from Messrs. ro, Ltd., Covent Garden, London. gh cleaning down of the house e given as advised under reply ider.

scullery

ertrude A. Traill).—By sprinkling h lime round the places where the r you will prevent their gaining an Salt used in the same way would effective. It is probable that they the overflow pipe, and this should ean.

m in soil

oyd).—As you have already lost so nts from this pest, we advise you your bed now, applying a dressing ne at the rate of 10 cwt. of fresh o half an acre of land, turning over the soil on three or four occasions during the autumn and winter, and deferring any planting until spring, as this substance is dangerous to vegetation. Strawson's Vaporite could be used, but must be dug into the soil at once, as the fumes ascend, not descend, and if this was applied and left for a few weeks the planting could be done this autumn. We consider, however, that in your case the former suggestion is preferable. Planting will be quite safe in spring.

Red Spider

(" Sylvania ").—It is by no means easy to rid a house of Red Spider when once thoroughly entrenched, as yours appears to be. A thorough spraying with Volck (to be had from any nurseryman) will do a deal of good, full directions for the use of this material being printed on the tins. Painting the pipes with sulphur mixed to a thin paste with butter milk is also worth a trial. Buckland Sweetwater often succeeds quite well in the same vinery as Black Hamburgh.

Cold frame

(G. W. H.).—You can fill your frame any time now, and up till nearly the end of September, with cuttings of Antirrhinums, Pentstemons, Pansies, Violas, Nepeta Mussinis, and Calceolarias. The last-named should be left till near the end of September, but the others may be handled at once. All the kinds named will succeed in boxes filled with light sandy compost, but the Pentstemons thrive better if planted in a bed of sandy soil made under a cold frame.

SHORT REPLIES

Miss C. Beck.—(1) Fritillaria chitralensis wanted. Although we have examined all likely growers' lists we have been unable to find anyone offering this rare Fritillary. (2) Yes, wash the sea sand before using it. (3) Old potting soil, if used, should be enriched with a little fresh loam and leaf-soil, for although a free and well-drained sandy soil is desirable for this Fritillary, it should be of fairly good heart.

G. Kipling.—Phleum phleoides (Purple-stalked Cat's Tail). A very troublesome weed to get rid of. Digging and hand-weeding is the only remedy known to us. This weed will even survive dressings of weed killer.

Miss A. G. Ross.—We have searched for the plant (Sphæralcea Fendleri), but fail to find it in any catalogue. Some of the Sphæralcea are shrubby, but the majority herbaceous. All belong to the genus Malvaceæ. Some are prostrate, but the majority are very similar in growth to the Sidalceas except that they have larger leaves.

NAMES OF PLANTS

A. M. N.—1, Heliopsis scaber B. Ladhams; 2, flowers too far gone for recognition, but probably an Helenium.

Mrs. Annan Bryce.—1, Photinia serrulata; 2, Myrsine africana; 3, Cupressus macrocarpa; 4, Itea illicifolia; 5, not recognised (kindly send another specimen); 6, Osmanthus illicifolius; 7, Physostegia virginicum.

Richard H. Hutton.—Potentilla procumbens. Hand-weeding is the only remedy known to us of getting rid of this little pest.

Francis S. Vereker.—Sorbus pinnatifida (Bastard Service Tree).

Barker. Geranium atlanticum (malvæflorum).

Mrs. Reade.—Pyrus Niedzwetzkyana.

H. Mills.—1, Polygonum affine; 2, P. vaccinæfolium; 3, Linaria alpina; 4, Geranium argenteum.

OBITUARY

ARTHUR WARD

We regret to record the passing of our old contributor, " A. W.," whose articles have for many years been the source of interest and help to many readers. Mr. Ward commenced his gardening career about 1869 at Stoke Edith Park, Herefordshire, where his father was then head gardener. After the usual course of elementary instruction he went to Chatsworth as journeyman; from there to Tortworth Court, Gloucestershire, the seat of the Earl of Ducie, first as journeyman and later as foreman. Four years later he moved to Euston Hall, Norfolk, as general foreman. After two years there he was appointed head gardener by the late Earl of Winchilsea at Haverholme Priory. During the period that he was at this establishment he remodelled the grounds, carried out a large amount of planting, and superintended the erection of a range of vineries, etc., supplying the plans and specifications in each case.

After four years' service at Haverholme Priory he succeeded his father at Stoke Edith Park and occupied that position for 17 years until the death of Lady Emily Foley.

He later entered the service of the late Mr. G. A. Dodd at Godenton Park, Ashford, and remained with him about 16 years.

During the Great War he rendered service at the Royal Botanical Gardens and gave lectures to plot-holders in various parts of London.

After the War he took up duty at the King Edward VII. Sanatorium, Midhurst, where he carried out various improvements in the gardens and grounds. During the time he was there he had the honour of conducting His Majesty the King on a tour of inspection of the gardens and grounds.

On September 14th, 1926, he retired on account of failing eyesight, and from then until the time of his death he resided at Wembley.

During his professional career he acted as judge at the principal shows, *i.e.*, Crystal Palace, Chelsea, Holland House, R.H.S. Hall, and others. He was known personally to many of the best-known gardeners and nurserymen, and was one of the oldest contributors to " GARDENING ILLUSTRATED."

He died suddenly from heart failure on August 22nd, aged 74 years, and leaves a widow and five daughters.

Report on condition of horticultural crops

VEGETABLES.

Beans, Kidney Runner.—Good average generally, though in places lack of rain has been responsible for poor crops.

Beet.—Crops average on the whole.

Broccoli.—Where rain has fallen good progress is now being made; elsewhere growth is still slow. Plants short in Cornwall owing to flea and maggot damage.

Brussels Sprouts.—Making satisfactory growth generally, but late plantings are backward.

Cabbage (spring-sown).—Improved; now hearting well generally, but in places crops are still patchy.

Cabbage (autumn-sown).—Germination good.

Carrots.—Average crop generally.

Cauliflower.—Improved in places, but still below average on the whole.

Celery.—Backward, but progress has improved where rain has fallen.

Cucumbers (under glass).—Average crops.

Cucumbers (outdoors).—Satisfactory in Middlesex, but in most places only moderate.

Kale.—Patchy; progress slow in places owing to drought.

Leeks.—Growth slow generally.

Lettuce.—Average crops.

Marrows.—Much improved in most parts and crops now about average.

Onions.—Variable, but on the whole rather below average. Bulbs on the small side.

Parsnips.—Average crops generally.

Savoys.—Variable; in most places progress is slow owing to lack of rain.

Sea Kale.—Satisfactory in Middlesex.

Spinach.—Average.

Tomatoes (under glass).—Crops well up to average.

Tomatoes (outdoor).—Satisfactory.

Turnips.—Patchy.

FRUIT.

Apples.—Generally clean and sound, but on the small side owing to lack of rain. Crops appear to be very variable, but about average on the whole.

(Culinary varieties).—Bramley's Seedling good in Kent, Middlesex, and parts of Somerset; elsewhere very patchy. Newton Wonder, fair; Lord Derby, light to fair; Grenadier, good; Lane's Prince Albert, above average on the whole.

(Dessert varieties).—Worcester Pearmain, very good in some parts and generally above average; Cox's Orange Pippin, light to fair; Allington Pippin, good; James Grieve, fair to good; Blenheim Orange, light.

(Cider varieties).—Crops are moderate in Herefordshire and Somerset, but only light in Devon, Gloucestershire, and Worcestershire.

Pears.—Crops are patchy and generally only light. Conference, heavy in Kent, and elsewhere fair to average; Fertility, fair; Jules Guyot, fair to average; Williams' Bon Chrétien, light; Catillac, light to moderate.

Plums (ordinary).—Fruit is sound and of good quality, but crops are only moderate. Victoria, fair to average; Monarch and Pond's Seedling, fair.

Plums (Gages).—Good in a few districts, but generally only fair.

Plums (Damsons).—Crops good in Kent, Norfolk, Isle of Ely, and Worcestershire. Fair in Cambs. and Middlesex.

Puschkinias

It always appears to the writer that many of the smaller bulbous plants which are little grown in the average garden would well repay more consideration of their beauties, especially for planting in the rock garden. I am aware that there are many lovers of rock gardens who look askance upon bulbs on account of the "untidiness" caused by the leaves lying about until they become ripe for removal. The present writer has in mind an old and ardent lover of rock plants who absolutely refused to admit bulbs to his rock garden because, as he said, they were "dirty" plants, this referring to the withering foliage. But one cannot have everything, and it would be a pity were all to deprive themselves of the joy given by these dwarf bulbs, even at the cost of a little untidiness. They can also be grown through some dwarf carpeting plant, and if the leaves of the bulbs are removed when they become yellow they will not suffer, and the rock garden will then show no signs of their presence while at rest.

This is a general plea for Scillas, Dwarf Daffodils, Muscaris, Brodiæas, Crocuses, Snowdrops, and other genera called colloquially "bulbs." My present purpose is to deal especially with and suggest the extended culture of the Puschkinias, charming little bulbous plants allied to the Scillas, but of distinct appearance. I may be told standard work on gardening tells u these bulbs require a little protect winter. I have not found this to be th and have seen them doing well in Edi for a series of years, and have grow myself for quite a number, and, even past winter, the Puschkinias did not in the least, although not protected way. They should, however, be pla light, sandy, well-drained soil at a d 3 inches and the bulbs about 2 inches Opinions differ respecting the num species, but for practical purposes the of P. scilloides may be held to cover ferent Puschkinias in cultivation. the name of P. libanotica there is fre sold a form with slightly larger flowe a compactly-flowered variety is kno P. libanotica compacta, but it may occasionally simply as P. scilloides con These Puschkinias have pale blue or flowers about April. They are prettil with darker blue. There is also a variety, P. s. alba. The flowers r height of from 4 inches to 8 inches a in racemes. The channelled leaves are shaped and deep green. S. Ar

Perpetual-flowering Carnat

These must now be brought under where they may be protected from rains. Before doing so, however, order to clear away Red Spider, the should be laid on a sheet of galvanis on their sides, and sprayed with a lit and water. Cool, airy conditions are able, the ventilators being kept ope night and day for the present. Large of Malmaisons which were potted on similar treatment, but young layered may remain in cool frames for the pre

R.S.V.P.

YOU ARE INVITED
TO JOIN THE

IRIS
SOCIETY

OBJECT.

The object of the Society is to encourage, extend, and improve the cultivation of Irises and eliminate by Trials and other means worthless and unnecessary varieties and to regulate nomenclature.

SOME ADVANTAGES OF MEMBERSHIP.

Informal Meetings, usually preceded by a Dinner, are held at intervals.
A Bulletin, to which leading experts in this country and abroad contribute, is issued yearly, or more often when matters arise making such publication desirable.
A Trial Ground established at Wisley in conjunction with the R.H.S. may be visited by members.
The Society will be pleased to give advice to members on any Iris questions.

Subscription 10/6 per annum.

Norfolk and Montbretias

WHERE in England—in fact, we ight say nowhere in the world—has ich strides been made in the improve- of this flower as in Norfolk.

ee employers and three gardeners stand the picture. Colonel B. J. Petre, ick House, whose gardener, Geo. n, made the first stride, the late Mr. y Morris, Earlham Hall, with e Mr. Geo. Henley as his gar- took up the flower when West- went more into fruit than s, and now we find them being r improved in Mrs. Edwin gu's charming place at Breccles nder the wizard-like hand of E. Fitt.

se who have had the good for- o see the plants this year have uch an advancement in colour perhaps even the first-named ist did not foresee.

rly September they are seen at best. Red, bronze, yellow, icolors, and clear colours, vy- ith each other for attention, up to 3½ feet long, individual s up to 4 inches in diameter, t looking coarse at that.

ick a few of some of the recent ns, we should say for depth of E. A. Bowles stands out first. tthew Wilson is a clear, deep imbus is a yellow bicolor, very in the flower, R. C. Notcutt to warm one by its colour. worth notice are Mrs. Edwin gu, Lady Wilson (see illustra- nd Phyllis.

J. Fitt tells us he raises hun- of seedlings every year, which ally get reduced to three or four of merit.

is energetic and enthusiastic, e might say has youth in his . Therefore we are confident ith of the possibilities of Mont- has not yet been reached.

w days ago Messrs. Barr and ent from their Taplow Nur- a selection of tall and stately m Montbretias of recent intro- . The varieties received were ajesty, Queen Alexandra, Apricot , Fiery Cross, and Red Knight.

e can be no doubt that these new mark a tremendous improvement on varieties, being twice as large, more , and in every way more desirable, at the same time being little or no ifficult to cultivate. They make ad- border plants, especially the variety ajesty, being extremely decorative over a period of several weeks, and are also admirably suited for cutting.

The fact that Montbretias, which commence to bloom early in September, are charming for cutting for vases, etc., their yellow and golden blossoms, set off by bronzy-tinted foliage, looking lovely on the table, should be a sufficient inducement to many to grow them, but when to this one can add that they last a long time when cut and placed in water—longer, indeed, than many other flowers—it is really surprising that they are not seen more frequently in our gardens. We have not found Montbretias particular as to soil. They do equally well in sandy soils as in heavy loam. The corms may be planted in October and November, and should be carefully divided every few years, otherwise they are apt to become weak. We say carefully divided advisedly, because there is a danger of breaking the brittle roots.

New Montbretia Lady Wilson, a worthy descendant of the famous Earlham Strain

Flowers very large, bright yellow with orange sheen

Select the largest corms and put into the position where they are required to flower, planting the others in a spare part of the garden so as to become strong. To have Montbretias do well they must never be allowed to get too thick, and to obviate this it is a good plan to divide them at least every second year, some people advising that this be done every year.

The Royal Horticultural Society's Autumn Show on September 19th & 20th

FOR some years the Royal Horticultural Society has held a great Autumn Show, and until 1927 it took place in Holland Park Hall. Last year, upon the completion of the Society's New Hall in Greycoat Street, Westminster, the Show was transferred to the Society's own buildings, and held partly in the New Hall and partly in the old one in Vincent Square. But the demand for space for all the varied subjects which are in their beauty in the autumn was so great that the available space was hardly sufficient. Consequently, the Council decided to hold four separate shows in the autumn of 1929, three for ornamental plants, and one for fruit and vegetables. The first of these shows, which is intended chiefly for open air plants and Roses, will take place on Thursday and Friday, September 19th and 20th. The others, which will be chiefly for shrubs, Orchids, and glasshouse plants, and fruit and vegetables, will follow in October.

The show on September 19th and 20th promises to be a very fine display of open air plants and Roses. While it has been possible to give most applicants larger sites than they have hitherto had, the demand for space has been so heavy that few have been able to obtain all they could fill. No doubt the effect of this will be that everyone will show only of their best.

For the convenience of visitors, exhibits of a similar character will, as far as possible, be grouped together. Dahlias and herbaceous plants will be the outstanding subjects in the New Hall, where Gladioli, early-flowering Chrysanthemums, and Begonias will
]

also be found. Roses will be staged in the Vincent Square hall, and, as the wall space is insufficient to accommodate all intending exhibitors, some groups will be placed against a specially-erected background. The body of the Vincent Square Hall will be filled with exhibits of rock gardens and water-garden plants. New or noteworthy plants which receive awards, together with any other novelties submitted to the Committee, will be shown on special tables on the dais in the new hall.

In order to give two full days for Fellows and others to see the exhibits, staging will be completed by 3 p.m. on Wednesday, September 18th, and judging will take place that afternoon. The show will open at 9 a.m. on Thursday, September 19th, and close at 7 p.m. On Friday, September 20th, it will open at 10 a.m. and close at 5 p.m. Fellows' and Associates' tickets will give free admission at any time when the show is open, but there will be no private view, the public being admitted by payment on both days.

The Fruit and Vegetable, Floral, and Orchid Committees will meet in the New Hall at 11 a.m. on Thursday, September 19th, and plants for their inspection must be entered with the Secretaries of the Committees by 10 a.m. that day. The Joint Dahlia Committee will meet in the New Hall at 10 a.m., and new Dahlias for its inspection must be entered with the Secretary of the Committee by 9.30 a.m. As the pressure on the clerical staff is likely to be heavy if all entries are left till the morning of the Committee meetings, it is hoped that whenever possible exhibitors will make their entries on the preceding afternoon. The Scientific Committee will meet in the Library at 4 p.m. on Thursday, September 19th.

The Great Autumn Rose Show

The National Rose Society's Great Autumn Rose Show is being held in the Royal Horticultural Society's New Hall, Greycoat Place, Westminster, S.W., the dates fixed for the exhibition being Friday and Saturday, September 13th and 14th.

This annual exhibition is without doubt the most extensive, beautiful, and varied display of autumn Roses to be seen in any part of the world.

Entries received from all parts of England, Scotland, and N. Ireland include a
of new Roses. In the artistic clas
competition this year is very keen, an
very attractive exhibits are to be seen.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Perofskia atriplicifolia

"H," IN writing in your last week's issue, under the heading, "A Random Commentary," is surely mistaken in speaking of Perofskia atriplicifolia covering too many miles of country in the Southern States with Sage Brush.

The so-called Sage Brush of the Southern States consists largely of various Artemisias, and especially the tall, shrubby Artemisia tridentata, known in America as Sage Brush, and sometimes as Purple Sage. This, despite the fact that the flowers of this plant are at best grey and not purple, the purple effect being due to distant effects in the way that distant mountain ranges appear purple and possibly, to a slight extent, to the faint purple tints developed on the foliage of this bush. Perofskia atriplicifolia (the name is variously spelt Perowskia and Perovskia, and is derived from a former Russian Governor of the Province of Orenburg) is a native of Afghanistan, the Western Himalayas, and W. Tibet, and occasionally referred to as Himalayan Sage. It is a most beautiful and showy plant at this time of year, and, as "H." correctly states, "all too seldom seen in this country." There are two very fine groups of it at Gravetye Gardens, near here, in utmost perfection just now and alone worthy of a visit to these notable gardens. W. E. TH. INGWERSEN.

Near East Grinstead, Sussex.

Perofskia atriplicifolia

A garden of annuals

To cover a large extent of bare soil very rapidly with a blaze of flowers is an achievement not always easily attained, so I
to send you some lines that may
indicate the great success attained a
borough near the Holbeck Tower
south bay. Inspired, perhaps, by w
had seen on the Riviera last season, th
gardener boldly sowed or planted a
patch of newly turned earth in April ar
with annuals both hardy and half-har
properly and carefully named. The
thriven amazingly, and it is quite a
to see the numbers of visitors down o
knees reading the names in their sur
the brilliance of the colouring. The g
wisely sowed blocks of bold thing
Mallows, Cornflowers, and Gladiol
wards the back, and broke up the
with groups of Cineraria mariti
Centaurea candidissima, and also li
Mignonette to separate the groups of d
annuals in front. All the best and
annuals were used, the tender ones
raised in pots and planted out. At l
or 60 labels must have been written
benefit of passers-by, and I heard
thusiast say it is a "liberal educat
gardening," so that will give an idea
interest it has aroused. I hope it may
peated another season as a depart
public garden planting.

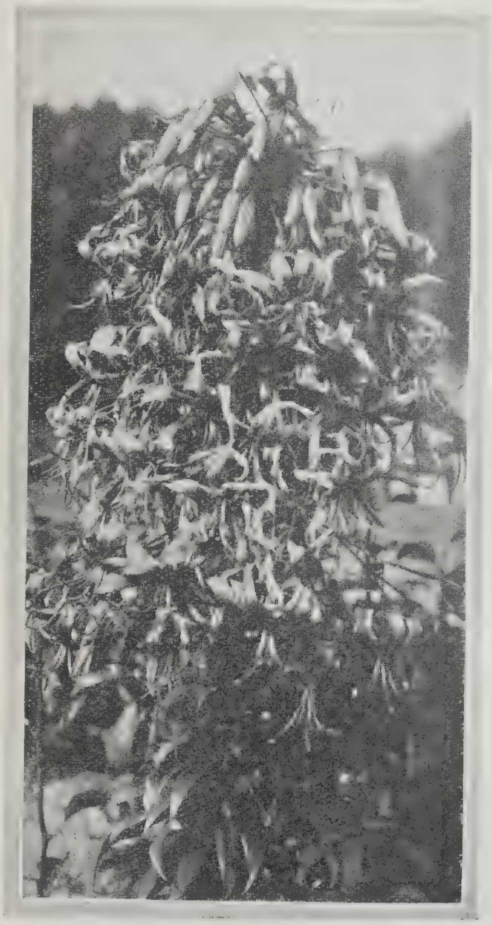
ch regret that, in my recent contribu- n this subject, on page 607 of ENING ILLUSTRATED," "Baron " appeared inadvertently instead of ction," the variety I intended to erise. There can be no question that mer occupies, by reason of its effec- l distinctive purplish colour, the same position among Gladioli that Reflec- w does among modern Sweet Peas. probably, the unconscious error to have referred.

DAVID R. WILLIAMSON.

Southport's Great Flower Show

THE Corporation of Southport claim to have the largest and the finest summer show in the world. The show started five years ago, and was supported by the great horticultural trade firms. From the point of view of a flower show it was a great success, but financially there was a heavy loss. Yet the Corporation had the courage to continue, and from the second year there has been a series of successes, both in magnificent floral displays and huge profits. Last year's attendance was over 80,000, and the receipts £11,275, against this year's just under 100,000 and £13,040. Moreover, this season has seen Society and county patrons from all over the British Isles in far greater numbers, and fully substantiates the claims and aspirations of the Corporation and the high ambitious aim with which they set out. Arranged with taste, the Southport Show of 1929 is easily a record for size, quality, magnificence, and every other laudable adjective. The Corporation's organisation has been a series of wonderful achievements without a mistake. The volume of business is such that year after year the permanency of Southport's future success is assured. Impartially considered, this is the most amazing achievement in the horticultural world, the dominance of all the summer flower shows in so short a space of time. In the space allotted, it is not possible to do anything like justice to Southport, but the brief history above will help readers to realise better what this show was like. The outstanding exhibit, an exposition of the highest cultural skill and technique, was staged by King's Acre Nurseries, Ltd., and consisted of fruit trees grown in pots in the open. The Apples (Gascoyne's, Peasgood, Emperor Alexander, Herring's, James Grieve, Charles Ross, Rival, etc.), the Pears (Pitmaston, Doyenne Boussoch, Marillat, Beurre Hardy, etc.), and Grapes (Black Alicante) were shown in the pink of perfection as very rarely seen. They were accompanied by other fruits in dishes. In the same section of tent were displayed on both sides a long line of stove plants, with Crotons, Dracænas, Lilies, and Orchids, a wonderful sight. Further on, Russell's Water Lilies, Clematis, and rare shrubs, and the Donard Nurseries with superb varied display in which the dominating feature was Dierama. The Sweet Pea Society, with competitive classes, comprehensive in extent, showed the best Sweet Peas of the year, the quality being exceptional. The British Gladiolus Society's varied exhibits were of superb quality, notwithstanding the adverse season. The newest creations of great merit included David Prior, Starbright (a yellow Prim. with red rays), Golden Frills (another yellow Prim.), Gloriana (salmon-pink), Refulgence (scarlet), and Jap Lady (bishop's purple). The Roses were very good indeed, and solicited great delight and admiration from all visitors. The Hon. Vicary Gibb's display of vegetables was of as high an order as ever. The fruit-decorated tables were really wonderful, including some almost faultless Muscat of Alexandria Grapes from Glamis Castle. The Grapes, a whole section to themselves, were good. Dobbie and Co. showed new Orchid-flowered Dahlias of fascination and charm which are certain of great popularity. They included Chameleon, Firefly, Goldfinch, Lapwing, Starfish, Ruby, and a host of others typical of the strain. Several exhibits of Chrysanthemums were staged by trade firms and were of fine quality. Dickson and Robinson made a grand group with Dahlias, Gladioli, and Chrysanthemums. Sutton and Sons staged as a central feature Gloxinias, with Ferns and other decorative subjects. The herbaceous and other plants in the great marquee must be passed over in favour of the other tents. Perry's Ferns, Water Lilies, and aquatic plants in large glass urns cannot be omitted, the latter quite new in horticultural exhibits, these aquatics of graceful Fern-like foliage, with goldfish swimming among them, attracted keen attention. Mr. W. B. Cranfield again easily carried off the chief trophy and firsts in almost all the Fern competitions. Though the season at Enfield has been bad for them, he showed Athyrium f.f. Clorissima, never before seen in such perfection.



Lilium Henryi with over 237 flowers

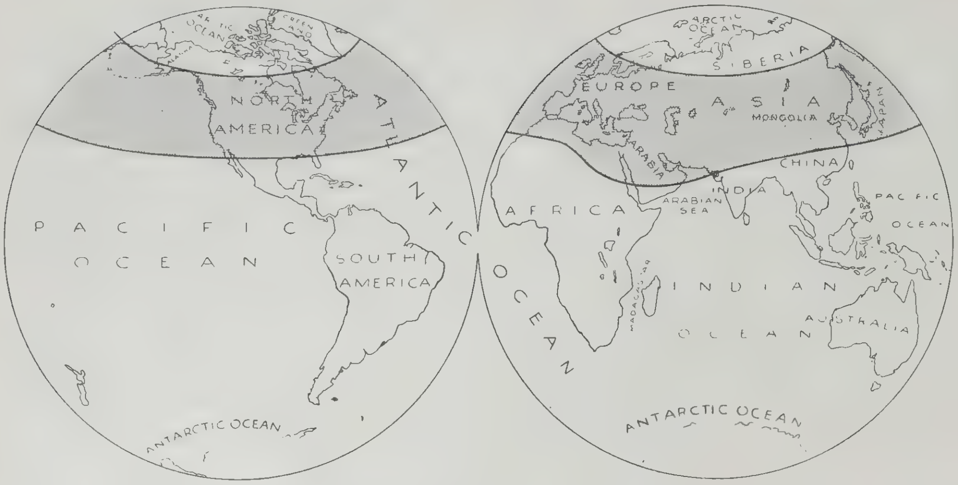
Vegetables, Pansies, and Violas as can only be generally seen in the North had a tent to themselves, the table decorations all in a further tent, bouquets and baskets another, and another even for wild flowers. The Lancashire County Council's Educational Exhibit, advertising the scientific and commercial side of horticulture, deserved great credit.

C. A. J.

Masters' Memorial Lectures

Two lectures on "The Relationship between Scion and Root-stock, with special reference to the Tree Fruits" will be delivered by Mr. R. G. Hatton, M.A., on November 5th and December 10th, at 3 p.m., in the New R.H.S. Hall.

The Masters' Memorial Lectures were founded in 1909 in commemoration of Dr. Maxwell T. Masters, F.R.S., the great advocate of "science with practice."



The natural distribution of the genus Iris

The shaded portion from Japan in the east to the Californian coast in the west

The Girdle of Iris

An Iris journey round the world with the sun

IF an ardent lover of Irises decided to make a journey round the world and never, as far as the land areas are concerned, be out of touch with his favourite genus, he could do it by taking an almost direct line from Japan in the east to the Californian coast in the west. The physical conditions of the earth make this direct line impossible except by air, but it so happens that in nearly every case of necessary divergence from it the traveller would come in touch with more representatives of the genus, until he would have had an opportunity of inspecting in its natural habitat nearly every known species. He might even discover others hitherto unknown.

Beginning his journey with the sun from Japan he would, of course, gather a handful of wonderful things before he started. By far the most gorgeous of these would be the many varieties of Iris Kæmpferi, which in Japan hold the place that is occupied here by our tall bearded Irises. Long before the intensive hybridising that is prevalent to-day in England began; indeed, whilst Britain was yet a land of fortified castles and moated granges, the Japanese must have been busy with their Kæmpferi. The result is that the production of really distinct varieties in Iris Kæmpferi appears to have reached its limit years ago. In fact, one is compelled to think that the doubtful constitution of many of the varieties of Kæmpferi is the result of over-breeding. Certainly these Irises do not appear to be so robust as they did years ago. There is one fact that should not be lost sight of, they are strong feeders, making a dense mat of root. Another is that they do not require the flooded condition of the soil we were once led to believe necessary to their welfare. They will absorb moisture freely during the growing season, but during the rest of the year prefer drier conditions. The wonderful range of colour produced during July in flowers truly magnificent in size render them subjects that are worth every effort
that may be made to grow them a
should be. The idea that they require
or even wet conditions to grow i
doubtedly arose from the fact that for
time it was thought they were desce
from the species Iris lævigata, which is
bog plant, but it has now been reco
that they are a different species and th
Kæmpferi is not truly a bog plant.

Before leaving Japan our traveller
probably gather a few of the true Iri
gata and also its white form, althou
might probably wait for the former u
had traversed the sea and arrived in
Siberia, Manchuria, or Corea, whe
would also find it growing wild. It is
waterside plant, and to it is allied

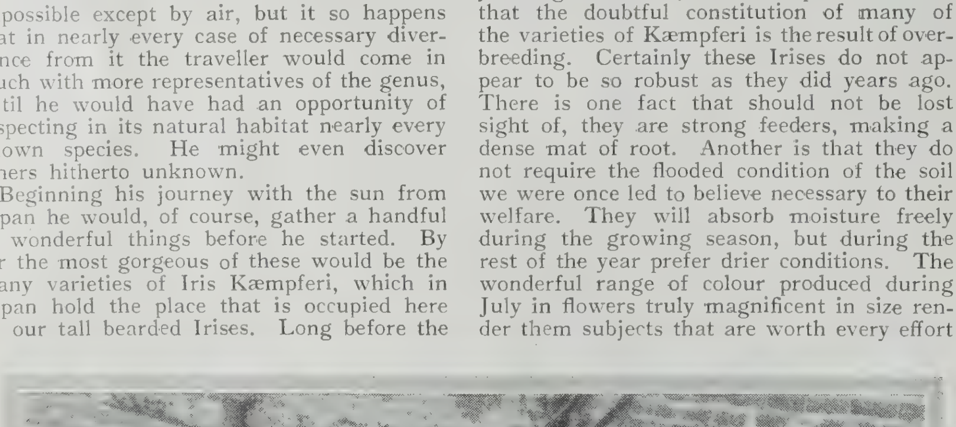
high and only produces a small flower
many people as lacking proportion.
is another Iris that may or may not
to the same section—Iris speculatrix
was found many years ago in Hong K
little plant growing about a foot high
red, purple, and white flowers. It is s
known that its exact relation to the E
section is not determined. I have no
able to trace that anyone has got it to s
a winter in England. Although the tr
would still have a long distance to go

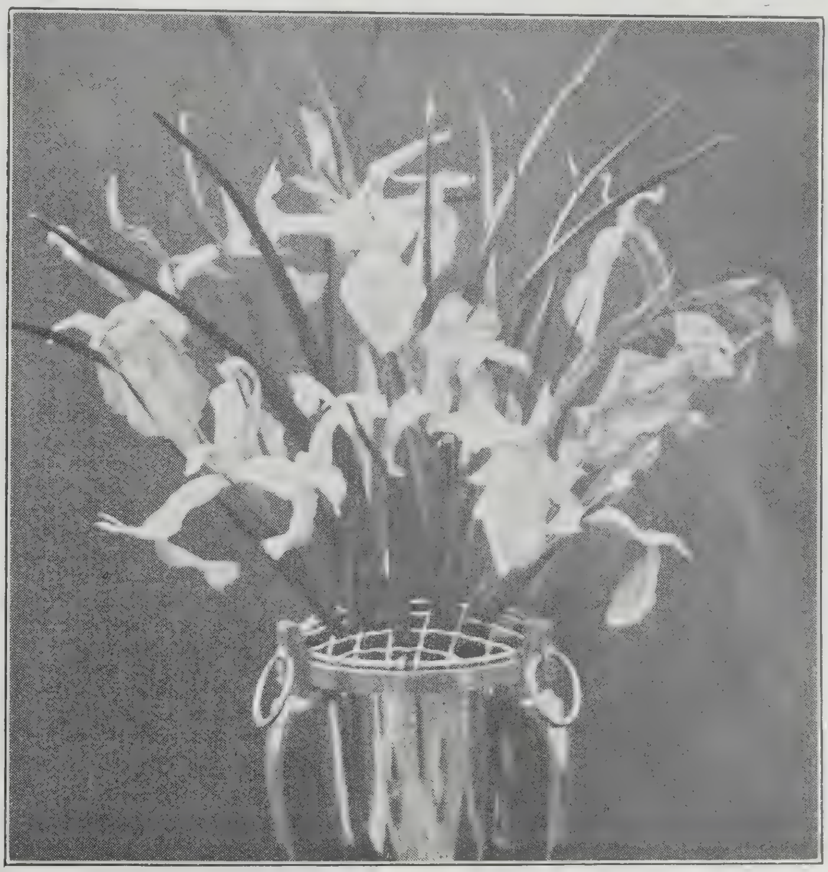


Iris pumila, native of Austria

journey's end he would probably come ss no more representatives of this section l he neared the end of his travels. He ld, however, meet many other friends be- he left China, the most important being e known as the Sibirica sub-section. true Iris Sibirica is a European plant, its near and distant relatives are spread the earth from Corea, Mongolia, and churia right across to Tibet. Nearly y exploring traveller who has searched hills and valleys over this vast area has d one or more species new to cultiva- , and although it is impossible to mention n all, the following have proved good gar- plants in England:—Iris orientalis, Iris avayi, Iris chrysographes, Iris Wilsoni, Forrestii, and a form presumed to be of rid origin, Iris Bulleyana, although it is known whether it was a natural cross in na or occurred after being imported to land.

ll these plants belong to the moisture- g class, and to them can be added Iris eri, which belongs to the sub-section ria. It will be noticed that nearly (but quite) all those mentioned so far belong he fibrous-rooted Irises as differing from e with a fleshy rhizome or bulbous root, as the traveller journeys towards the iterranean through Kashmir, Persia, and Asia Minor he would find this condition ging. He would have to spread himself ewhat, as he would be finding species Siberia in the north to the Arabian Sea he south. Here he would find the vast rity of the bulbous species and a very proportion of the rhizomatous section, also a number of fibrous-rooted species. would have entered the area extending Tibet and Western China to the ern seaboard of Southern Europe that produced the parents of all the wonder- garden Irises of to-day, known as the ded section. Obviously this is a collec- so rich that it is impossible to enumerate whole range, but by the time he had com- d his search the traveller would have ired representatives of the Oncocyclus on, and these would include Iris Susiana, Mourning Iris, known to cultivators in pe over 400 years and which was pro- y cultivated in Egypt 3,000 years earlier, Iberica, Iris Lortetii, Iris paradoxa, Iris , Iris Gatesii, and several others. Closely d to this section are the few known lia species, of which Iris Korolkowi and nifera are, perhaps, the best known, to this section belongs the beautiful Iris giana, a plant for every garden. The test attraction in both the Oncocyclus Regelia Irises lies in the wonderful vein- nd marking in the flowers. They are not asy to grow, but most of them can be n quite successfully with a little care. Nepalensis would be picked up en route. greatest finds would, however, be gst the bulbous Irises, Iris reticulata others belonging to the same section, as Iris Bakeriana, Iris Histrioides, Iris rio, Iris Vartani, and Iris Danfordiæ. our traveller would look round for re- ntatives of the Juno section, to which g Iris Persica, Iris Palestina, Iris arensis, Iris Willmottiana, Iris oides, Iris Bucharica, and last, but not , the early flowering, richly coloured Iris nbachiana. Of the Spuria sub-section ould find Iris Aurea, Iris Ochroleuca, Iris Monnieri. These with the type ia have been the parents of some very garden plants, and each is worthy of a in any garden on its own merits.

ere is one section of the genus of which mber of species would be found here and le farther westwards, and that would not once the traveller had crossed the tic. It does not occur in a wild state in America nor would he have encountered it in Eastern China or Japan, and yet it is the section that has produced the most valuable garden plants of the whole genus. It is not too much to say that it is the section that has made the Iris a popular plant, founded the Iris Society, and makes the Iris Show one of the most important events of the horticultural year. This is the Pogoniris or bearded section. Curiously enough this is the section that has actually set the United States aflame from Columbia to California, from the Pacific to the Atlantic coasts, and made of the Iris one of the most popular flowers in America. Moreover, South Africa, Australia, New Zealand, and Canada all find it possible to grow them successfully. It is impossible to mention all the species that would be found between, say, Tibet and the Mediterranean. Iris Flavissima, Iris Alberti, Iris Kashmiriana, Iris Biliotti, Iris Junonia, Iris Mesopotamica, Iris Cypriana, and Iris Ricardi are some of them, and they have all had their influence on the modern garden Iris and are species that our traveller would desire to inspect and collect. But this influence has been the more remarkable because it has been mingled with the blood of those found growing farther west still, and although we have not seen half the species in Western Asia we must pass on to Europe.



The Tangier Iris (Iris tingitana)

Of the bearded Irises of Europe there is practically the whole Pumila section, the species Aphylla, Pallida, Albicans, Variegata, and the tall branching Trojana, which may be of Asiatic origin, but the distribution of which as a wild plant is not known. These species and others similar are found in various districts right through Southern Europe and Western Asia, from the Caucasus to the Atlantic.

Another section that would be noticed in the journey west, or rather two sections, Xiphium and Xiphoides. These include the Spanish and English Irises, and to obtain representatives of all the species involved we should have to visit the islands of the Mediterranean Sea and the northern coast of Africa. To this section belongs the wonderful golden-yellow Iris juncea, the real beauty of which I never appreciated until this year, when I saw it growing in the nurseries of Messrs. Stewart and Son at Wimborne. Iris Boissieri is another beautiful species in the Xiphium section, but is reputed to be none too hardy; Iris filifolia is a species that has had a decided influence in hybridising; Iris Tingitana is a fine market plant when it can be flowered early and successfully, which is not always the case.

Whilst in Europe we must also mention Iris Unguicularis, better known, perhaps, as Stylosa, which occurs in certain forms, but is found more plentifully in Northern Africa, and our wild native species, Iris fœtidissima, one of the few Irises that will flower in the shade. Nor must we ignore various species in the sub-section Spuria, Iris Graminea, the beautiful little Iris Sintenisii, Iris Urumovii, Iris Spuria, etc.

A pause to appreciate the work of man in alliance with Nature on these species, and to realise how much they have contributed towards making the garden beautiful, and our traveller must continue his journey across the Atlantic to North America. Here he would find representatives of most of, but not all, the sections he has already encountered, and he would also find that though they may be akin botanically they differ in important characteristics. One of the first things he would notice would be the reappearance of the Evansia section in Iris cristata. This is a moisture-loving species, dwarfer in habit than even its cousin, Iris gracilipes, found at the beginning of the journey in Japan. There is another form of it that occurs farther north called Iris Lacustris, also a

Iris Lord of June

plant for the bog garden. The Sibirica sub-section also reappears in Iris prismatica, the only American representative of this group so far known.

By far the most interesting Irises encountered would be those in the Californian sub-section. Iris bracteata, Iris Douglasiana, Iris Tenuis, Iris Tenax, and Iris Purdyi are some of the best known. Then another series called the Longipetala section would attract the traveller, and in addition to the type Iris longipetala he would collect Iris Missouriensis, Iris montana, Iris Arizonica, and probably one or two species as yet unknown to commerce. Searching the river banks he might discover Iris Fulva, Iris Foliosa (the crossing of which produced the beautiful hybrid Iris Fulvala), and Iris Hexagona, a rather tender plant in English gardens.

Other species occurring in North America are Iris setosa (that might just as well have been gathered at the beginning of the journey in Japan or Kamtchatka) and Iris verna.

It would be folly to suggest that even all the *sections* that would be seen on such a journey have been mentioned. For instance, no mention has been made of Iris Pseudo-acorus, the golden-yellow water Iris that would be met with at most stages of the journey in Siberia, Asia Minor, North Africa, and all over Europe, and a purple counterpart of it throughout a large part of North America as Iris versicolor.

However, all journeys must end, and, continuing with the sun, he should re-arrive in Japan, having traced an Iris journey round the earth. During the journey the mere species encountered would number thousands as widely diverse as the little Gracilipes and Verna are from the giant Ochroleuca or the biggest of the modern bearded Iris. Every colour and every intermediate shade and blend of colour would be met with, and forms so different that it can scarcely be believed they really belong to the same genus. At no point would it be necessary to leave the northern zones of the earth. With very few exceptions every species met with can be grown in an English garden without protection, and if one could take such a journey and plant the produce of it in geographical order it would make opportunities for many other interesting journeys in the garden of memory. GEO. DILLISTONE.

Iris Lord of June

MANY new Bearded Irises have been raised within the last few years, and sooner or later we must harden our hearts and dismiss with a blessing many of the older varieties which have done service for years but are now far superseded.

One of the most remarkable creations in Irises is Lord of June, raised by Mr. Yeld. This is a good time for planting Irises, and those who are doing so should not fail to include the famous Lord of June. For the benefit of those who are not familiar with this variety we reproduce herewith a group of this bold, outstanding Iris. It is an exceedingly handsome variety of noble proportions, standards are lavender-blue, and the falls are rich violet-blue. Growing to a height of 3 feet to 4 feet, it is very bold and of vigorous habit. It is one of the comparatively few Irises that have gained the distinction of the Award of Merit from the R.H.S. As its name implies, it is June flowering, and according to the Iris
classification of the R.H.S., it belon

East Surrey.

Iris pallida dalmatica

HIS stately Iris is almost too well nown to need description. It was nown in cultivation as early as in the teenth century. Great as is the number es of high quality that has been brought late years, this fine thing holds its own of the best and loveliest. It is tall and ful. Each bloom measures a good nes, both high and wide, and is set at a istance apart. Fortunately for raisers, a good seed-bearer, for it is the parent ny of the newer kinds. It is also one best for border planting, for, unlike eater number of the Bearded Irises, it its handsome sheaves of leaves well he late summer.

G. J.

The Iris season

By Robert W. Wallace.

IE past Iris season has been full of terest. After the dry summer of last ear one expected a good show of flower low, but the intervening cold and dry which followed gave doubts as to what esults would be. However, the cold, pring was very beneficial, for I have known better growth and flower and ce from disease, except that cases of " occurred in several quarters, due, I ure, to frost on badly rooted plants. winters evidently produce rhizome rot.

Iris enthusiasts the Iris Show in the Hall of the R.H.S. was the event of the . Few expected such a result. The groups were very good, as usual, but idening of interest shown by the in-d amateur exhibits was a great source isfaction, whilst the attendance was also ent.

vards the end of the season, being in eighbourhood of Liverpool and a night are, I found a splendid host in Mr. ey Pilkington. I have always wanted how and where he grew his Irises. I an old garden enclosed on three sides, g and open to the south, a light, rich, cultivated, well-drained soil; in fact, of his Irises are grown on what has een vegetables for many years. South wall garden and still sloping were long f the finest varieties, a mass of bloom hard grass walks between, the lower screened by belts of trees keeping off scorching winds. If to these conditions d "G. L. P.'s" intense personal in-in the family and his intimate know-of each individual variety and its needs ed not wonder at the fine displays he .

, such fine results from good culture ithin reach of most growers who will ains.

as interested to see the growth of his dis. They are very fine, but to me huge flowers and foliage all staked are spiring. For some years now I have ursing and growing a number of seed-ll bred from finest types, and this sum-e had a feast of flower and a foretaste d things to come. The weather was d dry and windy, and seedlings that and up all day under such conditions eded.

y of the new pink art shades have but substance. Pink as a colour does not lly make for substance, but purple Witness Mme. Gaudichau. She will up through all wind and wet. These are the types to breed. Four good reds are on the way, and we had a fine tall yellow, very deep in colour, which struck a fine note. One more note, it was a pleasure to meet such an enthusiastic American Iris "fan" as Dr. Ayres. He is devoting much time and thought on scientific lines to produce certain colours, and will probably "get there." In spite of the dry summer I find Irises are making enormous new root-action at this season, which promises well for next season.

Robt. W. Wallace.

Iris pallida dalmatica

Irises in Canada

By William Miles

Reprinted from Iris Society's Bulletin No. 7

As a very successful and enjoyable Iris blooming season is drawing to a close, a few notes regarding Iris doings in Ontario may be of interest to you.

One of the most representative collections in this Province is that which has been assembled during the last few years by Mr. H. H. Groff, of Simcoe, Ontario. Mr. Groff, who has gained a world-wide reputation as a hybridiser of the Gladiolus, is going to work at his new hobby along the same lines that enabled him to achieve such outstanding results with his earlier fancy. The first crop of seedlings to be raised here will not flower till next year, and the main interest was the large collection of the finest varieties collected from all sources.

It may surprise one who perhaps regards Canada as a land of snow and ice to know that many of the Californian mesopotamica hybrids flower freely in the open garden, with no more protection than a light covering of Pæony tops to prevent alternate thawing and freezing in the early spring. Conquistador, growing well over 4 feet, the enormous flowers of Bravura, and the excellent habit of Alvarado instantly drew one's attention, while later in the season the reddish Esplendido was very outstanding. In this climate with its hot days, a very large flower needs to have very good substance if it is to stand up. Some of the mesopotamica hybrids fail in this respect, although they are no worse than Lord of June or Leonato.

Among the "Dominions" the outstanding varieties from a garden decorative standpoint were Tenebrae and Duke of Bedford, while Pioneer, which was new to most of us, was very highly thought of.

Having heard such glowing descriptions of Peerless it was indeed a pleasure to find a mass of it in full bloom, with its large flowers standing up on a hot day. It was a little under 3 feet, and in the opinion of all present a magnificent Iris for Ontario conditions.

The flower of them all, though, to my taste, was Britoness. Such a clear, clean-cut flower of a distinct breakaway in form from the usual run of yellows, very free, and a first-class garden plant. Growing nearby was Cayeux' little Bastien Le Page, the deepest of the yellows, and while small, a flower of great quality and substance.

In the garden of Mr. J. W. Crow at Simcoe we found two of the finest seedlings that we had run into this season, one along the lines of Cardinal, the other with more blue in its make up, both of good size and wonderful substance.

On June 11th the London Horticultural Society put on a very good show of Irises. The quality of the blooms was of a very high order, and there was a good representation of the best commercial kinds. The major interest, however, was in the seedling classes, perhaps a quarter of the staging being taken up with these. First and second prizes went to two seedlings of Dominion type shown by Mr. Cousins, both of which would be a credit to their raiser in any company.

Mr. Cousins has raised a large number of very fine seedlings, mostly with flowers above the average in size, some of which will doubtless be heard of again. Some of the outstanding varieties were several yellow and bronze blends, along the lines of Mrs. H. F. Bowles, but with much larger flowers.

Mr. S. F. Wood, the very able judge, had on display some of the very fine things that we have been watching in his garden for several years. Particularly fine was his No. 326, very deep purple, with the falls of most excellent substance, and almost black. This is good every year, and is one of the coming varieties for Ontario gardens. No. 5176, a pink and yellow blend, with heavily veined falls and a prominent orange beard, is always good in the garden. A piece of this in my own garden is one of the most satisfactory plants I have.

No gardener ever visits London without

going to see the garden of our well-known Canadian horticulturist and naturalist, Mr. W. E. Saunders. This year he had among a large crowd of good things Le Correge, which captivated us all, and also a good clump of Mr. Dykes' Moonlight. Two years ago Micheline Charraire flowered well in this garden, and after loafing for a year came again this year with some magnificent flowers, and it is the best white Iris we have seen this season.

In my own garden the Iris season started on April 14th with Sind-pers and will wind up with Aurea, which is now showing colour. Last year some seedling Pumilas very obligingly flowered in the autumn. Perhaps the most satisfactory newcomer was the T. B. Cardinal, which stood up and retained its form tolerably well in a storm that reduced Bruno and Duke of Bedford to pulp.

Iris lovers in Ontario are paying more and more attention to performance in the garden. A fine flower is a great attraction, but of what avail is that if the plant lacks constitution, or blooms only in the most favourable season?

Your A.M.'s at Wisley went to good garden plants, but here Lord of June is altogether too floppy. One has to see it before breakfast, and then one has a taste of what it would be at home.

A small selection of bulbs for pots and spring bedding

AFTER visiting the Alpine-house at Kew several times last spring, and making many notes on the spring bedding displays in the parks, I came to the conclusion that there were very many choice bulbs and plants of easy culture that were too seldom seen in private gardens.

For pots this year I suggest the following, in addition, of course, to the usual Hyacinths, Tulips, and Daffodils:—Iris Vartani, a delightful little slaty-blue Iris which, if planted now and given cold frame treatment, will bloom about mid-November; I. reticulata and I. tuberosa, both excellent in pots with cold frame treatment, reticulata blooming in January and tuberosa about early March—the latter is seldom seen and a very distinct flower of green and black. I. tingitana is useful for early work, but I have not found it too reliable. Jonquils one must have in variety, they are so bright and sweetly scented. The miniature Daffodils are delightful when grown in pots in frames or cold house, Cyclamineus and the white and sulphur Hoop Petticoats being particularly good for this purpose. Fritillaria aurea and F. pudica make charming pots. Bulbocodium vernum, like a small rosy-purple Colchicum, looks well in large pans. Hyacinthus azureus and Puschkinia Libanotica (the Lebanon Squill) are two gems for pots or pans. Crocus versicolor var. picturatus and Crocus corsica, also C. imperati, do well with cold frame treatment, and bloom in early spring, Imperati in January. Of Tulips, Kauffmaniana, the type, and its two varieties, Brilliant and Gaiety, are superb. A few pots of these, when fully open on a sunny March day, are worth going a long way to see. I mean to grow several pots of these this year and also Iris Sind-pers, a lovely thing of pale mauve.

Snake's-head or Widow Iris (Iris tuberosa)
Flowers green and black

For outside, Iris filifolia Imperator, a fine, large, early, blue form of Spanish Iris, makes a fine bed and is very cheap. A small bed of Caltha palustris flore-pleno (the double Marsh Marigold) associated with blue Forget-me-not looks lovely. Tulip La Candeur with Dr. Mules Aubrietia looks wonderfully well. This year I am trying Afterglow with Silene as a groundwork. Arabis Double White and Double White Daisies and Pansy Bronze Queen or Viola Arkwright's Ruby are other suggested carpeters. ATHELSTAN L. WARNER.

"Westway," Sawbridgeworth.

Cultivation of Lilium Harrisi

This being the time of year when bulbs of the Bermuda Easter Lily (Lilium longiflorum Harrisi) arrive, a few notes on the cultivation of this well-known greenhouse Lily should prove helpful to many.

When the bulbs are received they should be potted into suitable-sized, well-drained flower pots, using a compost of three parts of good fibrous loam to one part of well-decayed horse or cow manure. The pots should be filled about one-half full of compost, and at a later date, when active growth has begun, a rich top-dressing of equal parts of loam and cow manure should be added.

When the Lilies are first potted they should be placed in a dark, cool place and watered thoroughly. Under such conditions the bulbs will root readily. Before hard frosts they should be removed to a greenhouse and given a temperature of 45 degs. to 50 degs. F. at night for a week or 10 days. When top growth commences a steady temperature of 60 degs. F. is desirable. This should be raised to 65 degs. F. during the day. They should be given abundant ventilation and the plants should be freely watered on bright mornings, but the foliage should be kept fairly dry during the night.

It will require approximately 13 weeks from the time that the plants are brought into the house to get them into flower. In order to have Lilies in their prime for Easter the buds should show about six weeks previous to that date. They may then be gradually developed, but if they develop too rapidly they may be placed in a cooler temperature.

For the best success in growing Lilies the water used for watering should be warmed to about 65 degs. F.

When the Lilies begin to show buds a weekly application of liquid-manure may be given, using 1 bushel of cow manure to 50 gallons of water. If the growth is very slow 1 oz. sodium nitrate may be added to each gallon of water.

"Consider the Lilies"*

A new handbook on garden Lilies
some years been wanted. The las
dealt with the subject comprehensive
from the pen of Miss Jekyll, and som
later a small work by Mr. Grove wa
lished. The former has never been
up to date, and the limitations of
paratively small publication prevent
latter from dealing very exhaustivel
the genus as a whole. "Consid
Lilies," by Mr. W. E. Marshall, goes
than either, and whilst not pretendin
a complete monograph, covers an en
area of ground not hitherto attempte
book for the ordinary gardener as apa
the specialist. How and where to pla
paration of the soil, where the
species will best succeed, what they a
where they come from, propagation
seed, bulbils and scales, and a host o
information is given concisely and
Diseases and their remedy are dealt
and various excellent tables given.
author advocates and gives a list of
fifteen varieties or so for the rock
and this will probably shock certai
garden purists.

Up to the time of publication the
clature appears to be careful and c
in fact, it is probaby the most correct
work of the sort yet published. The
and varieties are dealt with alphabe
and the descriptions are obviously fro
personal experience of the author. He
largely to his colour plates to conv
values of most of them. As there a
varieties in the index, and over 90 of
are illustrated in colour, it will be
understood that colour printing has fa
quite "get there" in some cases. Co
ing the difficulties and magnitude
task, the amazing thing is that so m
them are really successful. Very few
convey a correct impression of the fl
and these are unimportant exceptions
some cases these colour plates are rea
ceptionally good. The few black and
illustrations used are uniformly good
the two pages giving portraits of 17 di
types of bulbs and rhizomes are not onl
interesting, but valuable. Altogether
a valuable addition to the gardener's li
a handy-sized, informative book that
Lily lover will want, and every garden
should have, because so they will b
on the way to become Lily lovers. One
is certain—no book containing the il
tions this one does could possibly b
lished at the price and show a profit.

ting and planting bulbous Irises

ANISH Irises and the newer race
of Dutch Irises may be grown in pots
as well as in borders. Although they will
stand hard forcing, it is possible to have
plants in bloom several weeks before
grown in the open borders, if care be
n in regard to watering and airing. If
n in pots the compost should be made
f sandy loam with plenty of fibre in it,
leaf-soil with sand. A small quantity
tted manure should be placed with some
e rougher portion of the compost over
crocks. The bulbs must be put in just
enough apart to allow of sufficient space
out undue crowding when they are fully
n. Water directly the planting is
ned, and place the pots in a cool quarter,
ld-frame being a suitable situation for
. These Irises are hardy, but it is
sable to keep them quite safe from frost.
-drained pots are essential, so, also, is
ist rooting medium, but stagnant water
d cause mischief, and for that reason
ugh drainage must be the rule. At no
must the soil be allowed to become dry,
ially after the bulbs have commenced to
. Feeding must be done regularly after
ots are well filled with roots. Much
e is made long before the flowers
ar, so that the inexperienced cultivator
not be alarmed at the non-appearance
e flowers for a considerable time. A
e heat when the plants are growing
will do much good, but at no time
d they be subjected to a high tempera-
and close atmosphere.

e most suitable position in open borders
e which is constantly moist, but which
not hold water for any length of time. The soil should be deeply dug, and, if of a clayey nature, road grit or old potting soil should be freely mixed with it. Those plants grown in pots may be had in flower during the latter part of March and during April and May. Those grown in the open border will bloom at the end of May and throughout June, according to the situation in which they are placed. Pot and plant fairly early in the autumn, and be sure that purchased bulbs are not allowed to become very dry before they are either potted or planted, as they would lose much strength. Really fine bulbs may be purchased at a very low cost, so that the cultivator need not stint himself as regards numbers when purchasing them.

These bulbous Irises have much in common. That is to say, that in the majority of instances they require—or pay for—annual lifting and a moderately long season of rest. The bulbs mature in July and are usually ripe and ready for lifting after the middle of that month. During the resting period the bulbs should occupy a well-aired place in shed or outhouse, where they would be protected from sun heat. Cleaning and the removal of the " spawn " (bulblets), numerous in some varieties, should follow in due course. Replanting may be done any time after September is out; to delay it long, to defer planting into the winter months, when the soil is both wet and cold, is to court inferior results at flowering time. A moderately rich, deeply-cultivated, loamy soil suits them well. If manure be added, keep it well below the planting level of the bulbs. A good planting depth over all is 4 inches, though the more vigorously-constituted sorts do not object to being planted 6 inches deep. Some varieties of the Spanish set are dwarf-habited, and have quite small bulbs; others, like the tall and vigorous Thunderbolt (Gold Cup) are larger. The new Dutch Irises also vary in this respect, the later-flowering English Irises having larger and longer bulbs with much coarser tunics. These last-named are characterised by stronger stems, bigger flowers, and coarser-arching, deeply-channelled leaves. Valuable in the garden for succeeding the others named, they lack their elegance and utility in the cut state, and for these reasons are less popular.

New certificated Chrysanthemums

The first meeting of the Floral Committee of the National Chrysanthemum Society of the current season was held at the New Hall of the Royal Horticultural Society, Greycoat Street, Westminster, S.W. Mr. D. B. Crane was again elected chairman, this being for the twenty-eighth consecutive year.

No fewer than 20 novelties were submitted for adjudication. We believe there have never been so many new sorts placed before the Committee at its first meeting. Each of the following varieties gained the Society's much-coveted first class certificate.

WINNIE AVERY.—A flower of good form, having florets of good length and breadth and of good substance, building a flower nearly 5 inches across. Colour, old gold. Shown by Mr. C. T. Kipping, Althorne, near Colchester. (This variety also gained the Award of Merit of the R.H.S. on August 27th last.)

ALMEDA.—This is a promising variety. The florets are fairly broad and are of good substance, building a bloom rather more than 4½ inches across. Colour, light bronze. Also shown by Mr. Kipping.

CRIMSON FOUREX.—A quite distinct, pretty Japanese bloom, having rather narrow florets, of good substance, building a full flower about 3½ inches across and of pleasing form. Colour, crimson with rich golden centre. The plant is said to be about 3 feet in height. Shown by Mr. J. Barrell.

KINGCUP.—This is a striking plant suitable for border culture. The flowers are borne in pretty sprays and are made up of rather narrow florets, building pretty blossoms of a reflexing character. Colour, rich golden yellow —a colour badly wanted in the outdoor sorts.

Van Ravesteyn, a new Dutch (Xiphium) Iris
Standards pale blue, tinged grey, falls light sulphur and deep yellow

The plant attains a height of about 4 feet. Shown by Mr. H. Shoesmith, Jnr., Mayford, near Woking.

A variety which did not obtain a certificate, but which is of good quality and of considerable promise, is

ASSURANCE. It is a flower about 4 inches or rather more in diameter, having rather broad florets that build a flower of even form. Colour, chestnut crimson with golden reverse.

D. B. C.

Epilobium chlorifolium

Farrer begins his descriptions of the Epilobiums, or Willow Herbs, with a strong condemnation of the genus for the garden. He says they are "a most fearsome race of rampant weeds, usually either 5 feet high or perfectly flat upon the floor, but in all cases weeds of the worst, even when pretty." He modifies his censure considerably, however, when he comes to deal with some of the species, and when he speaks of the New Zealanders he seems inclined to a more favourable view, characterising the flowers of some as "rather pretty." E. chlorifolium does not find a place in "The English Rock Garden," but it is quite a pretty little subject for those who desire a low, carpeting plant for the rock garden, especially in a cool, rather shady place. It grows close to the ground and produces a charming carpet of small glossy leaves, spangled over with white flowers, which are occasionally tinged with pink. E. chlorifolium found a place in my garden in the autumn of 1927, and I am glad to see that it has become an established favourite with other members of my household besides myself. I am growing it here in a north-west exposure and in two places on rockwork, one at the base and the other about 8 feet above the ground level. It is doing well in both places and stood the last two winters without harm. It is raised from seeds or increased by division. S. ARNOTT.

Trolliuses (the Globe Flowers)

One of the hardiest plants which will thrive and do well in bleak, exposed gardens, the flowers of which, as they appear, are connecting links between spring and summer, is the Trollius, or Globe Flower. They will grow in sun or partial shade, and will give good results if planted in ordinary soil, but they appreciate a rich soil, and soon show it by quicker growth and enhanced quality of the blooms. During May and June you may ensure the flowers if you get in the clumps in October. Frost affects them little, if at all, and anyone having a north border should not forget that though the blossoms may be a week or so later than plants growing in a sunny position, some of them are worth planting in cool quarters. To have the best from them, Trolliuses ought to be planted in soil in which old manure or decayed vegetable refuse has been worked in order to provide a certain amount of humus which they like. This is the best time of the year to plant, as it is also the convenient opportunity to propagate by division of roots, quite small pieces when given suitable soil making good-sized clumps in a couple of seasons. Let those who may not grow them, and who like a spring display of bulbs, Wallflowers, and Forget-me-nots, remember that Trolliuses bring a rich glow of colour to a garden, contemporary with the blooming of things mentioned, and are a real acquisition to any garden when their showy heads appear. Here are some of the varieties which are worthy of culture, and from a long experience of them as late spring flowers, I have no hesitation in recommending them to the consideration of anyone with a moderate-sized garden:—Orange Globe (light orange), Excelsior (large yellow), Golden Queen (deep yellow), Gibsoni (yellow with black zone), Fire Globe (semi-double, deep orange), and Empire Day (one of the earliest, large, light orange yellow). WOODBASTWICK.

Iris trials at Wisley

The following awards, issued on September 9th, have been made to the undermentioned Bearded Irises by the Council of the Royal Horticultural Society after trial at Wisley :—

AWARD OF MERIT.

Sweet Pea notes for the nov

WHEN comparing home-grown
Peas with those seen on the e
tion table, there are several s
points which should not be overlooked
perhaps it would be as well to deal with
in the order in which they naturally fall.
first detail which calls for attention i
actual seed itself. It should be under
that there are two distinct kinds of
Pea flowers cultivated at the present
the grandiflora type and the Spencer
These are differentiated by the form t
by the standard; that is, the largest
uppermost petal. In the case of the gr
flora this petal is perfectly plain, whils
Spencer Pea has a waved or frilled stan
which greatly enhances the appearanc
the flower. To emulate the success o
exhibitor it is necessary to commence
the correct type of seed rather than to
on a packet of nondescript grandifloras.
cheapness of the latter is no doubt du
the diminishing demand for it, and alsc
fact that it sets its seeds much more f
than the Spencer varieties. There is
another factor which must not be overlo
in connection with the seed, and tha
quality. Sweet Pea seeds possess cer
characteristics which, although not alv
infallible, are, nevertheless, looked for by
experienced eye as an indication of t
worthiness. With a little observation
beginner soon becomes familiar with t
details, the first one of which is that a g
selection of seeds of one variety conta
specimens of fairly equal size. Undoubt
the best procedure at the beginning is
obtain seed from a source which can be re
upon to furnish sound material. The
adage that the cheapest usually proves
dearest in the long run is as true in conn
tion with Sweet Peas as most other thin
Second grade seeds involve the same amo
of time and labour in their cultivation,
the results fall far below the desired st
dard. There is no time like the present
deciding upon the varieties which one
tends to grow next year. At the major
of shows and exhibitions can be seen ma
of the most recent introductions to co
merce, side by side with the best of the ol
and well-tried varieties, and a few notes ma
now prove very useful when the time

seed arrives. The majority of en-
asts like to provide accommodation for
any novelties as possible, but it is erron-
to think that the newer the variety the
the flowers. There are at present on
narket Sweet Peas with sterling quali-
which took years to produce, and which
take many more years of endeavour to
ss. For instance, in the report on the
ea exhibits of this year, "GARDENING
TRATED" drew attention to the merits
R. F. Felton (still the best lavender),
l Mauve, Austin Frederick Improved,
ance Hinton, Powerscourt, Youth,
Picture, still one of the most charming
t Peas." When well-grown and
ically staged, Sweet Peas of an orange
lmon shade attract much attention on
nt of their exquisite colouring. It is
however, that the innocent onlooker
fall into a trap. To obtain these colours
rfection it is necessary to take precau-
against strong sunlight, and many of
looms seen at an exhibition have either
grown in a greenhouse or provided with
iate arrangements for shading. Such
ies as Gold Crest, George Shawyer, and
ado when expanding in the open gar-
under two days of strong sunshine are
e same in appearance as their relatives
e show bench. All Sweet Peas are more
s susceptible to the influence of the sun,
e tendency to fade is most marked in
olours mentioned. However, this is a
em still engaging the attention of the
dist, who has every hope of his efforts
eventually rewarded by the production
igorous and fadeless orange Sweet Pea.
o more essentials should now arise for
vation, namely, the appropriate times
owing the seed, and the thorough pre-
ion of the site the plants will occupy.
, however, are perhaps best dealt with
eir proper season. For the present it
uffice to explain briefly how exhibition
rs are grown. It would be futile to
the seeds in the ground, surround them
pea-sticks as in the case of culinary
and allow the plants to develop at their
ree will. Such a procedure is excellent
garden decoration is the object in view,
for obtaining choice, first-class cut
s it will not answer the purpose. The
lowers are cut from plants trained on
'cordon" or single-stem system, a
d which is about as unsuitable for
n adornment as naturally-grown plants
r the production of prize flowers. This
d entails the provision of a separate
rt for each individual plant—a tall
o cane for preference. As the stem of
ant increases in height it is loosely tied
cane at appropriate intervals, a neces-
aused by the removal of all tendrils
dition to these, the side-growths which
ate from the leaf-axils are pinched out
n as they are large enough to be con-
tly handled. Thus the full benefits of
ctivity in a specially prepared medium
nfined to one channel, the result being
ter haulm, more expansive leaves, and
and stronger stems bearing larger
s. Furthermore, a greater percentage
stems carry four blooms each.

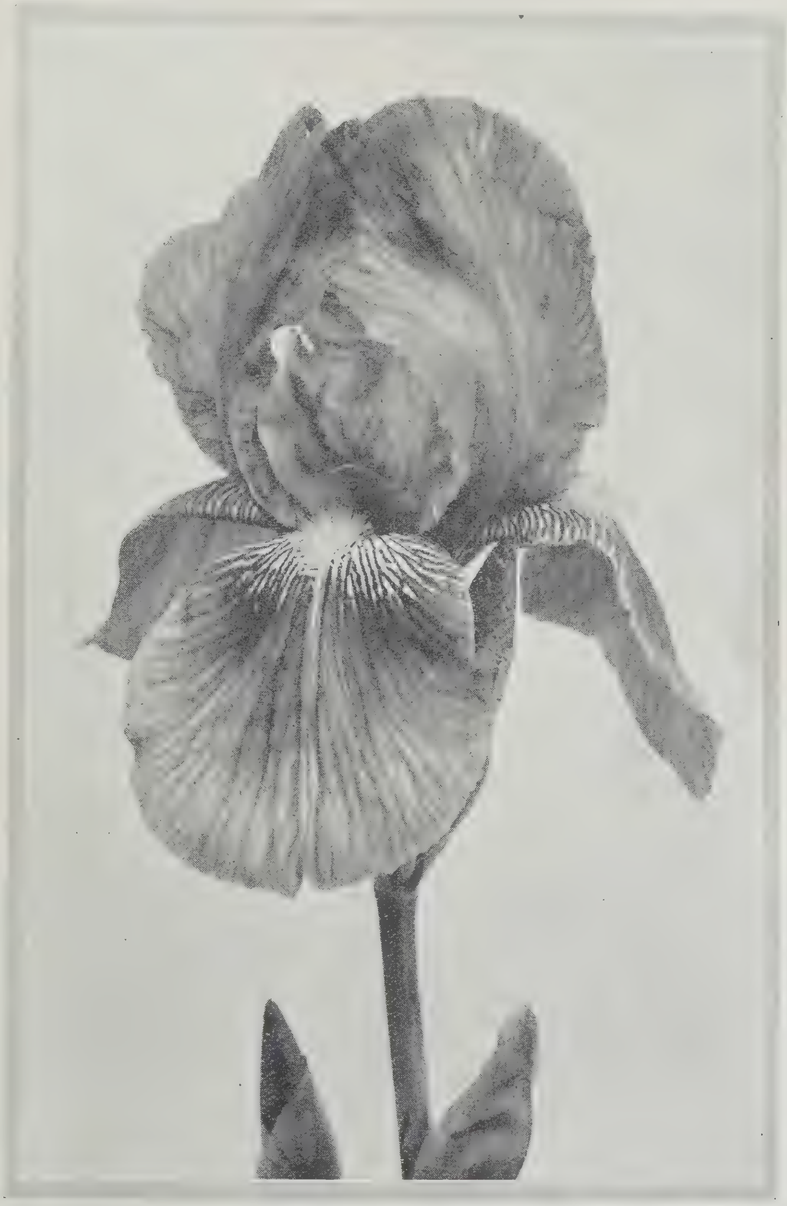
Iris Amber Wave

Shekinah x a sister seedling of Mrs. V. West

THIS seedling was sent us by Mr. Bliss in 1923 for trial. He considered that the form of the flower was almost perfect in size and poise, but was a little doubtful about the colour, which he thought dull. The standards are buff shot with bronze, and the falls a peculiar violet puce colour, very velvety in texture. When this Iris flowered we agreed with Mr. Bliss that the colour was not sufficiently striking, and we decided that although it was almost a perfect Iris in size, shape, and texture, we could not name it. We hoped that by using it for hybridising we could improve the colour in some way. In 1925, therefore, I hybridised Shekinah and Mr. Bliss' seedling, using the pollen both ways. I naturally hoped to obtain some seed from both crosses. Nature decided otherwise, however, and the result was four seeds only germinated from Shekinah's seed-pod. The first of these flowered in 1927 and was Amber Wave. An unexpected and extraordinary result. I aimed and hoped to get a Dominion variegata, imagining that the yellow in Shekinah would intensify the buff standards in Mr. Bliss' seedling. Actually I got an amber yellow self. This is a correct and bald description of one of the most beautiful and unusual Irises I have ever seen. The colouring is most subtle and elusive, and can be more fully described as amber-yellow suffused and shot with palest olive-bronze. The falls have a lovely faint velvety violet-blue flush at the haft which is all Shekinah has allowed to be perpetuated of Mr. Bliss's wonderful Dominion velvety fall. Not an Iris for the man in the street, but an Iris which will delight the flower-lover with a discerning eye who can appreciate something subtle, quaint, and unusual.

OLIVE MURRELL.



Iris Amber Wave

"The Anatomy of Dessert"

Mr. E. A. Bunyard's new book, "The Anatomy of Dessert," is to be published on October 1st. The book is written for the gourmet, whether gardener or not, and is the first of its kind, no guide to the dessert having yet been published. The edition is limited to 1000 copies signed by the author, price 10s. 6d. Great care has been taken in the selection of paper and type, and the frontispiece by John Nash adds distinction to the format. The publishers are Messrs. Dulau and Co., Ltd., 32, New Bond Street, London, W. 1.

REMINDERS FOR THE WEEK

Southern and Midland

Sweet Violets

The plants which have been prepared for flowering under glass should now be lifted with a ball of earth and transplanted in well-prepared beds in cool frames. The soil for these should consist of a fair proportion of maiden loam and well-decayed manure to which has been added a little lime-rubble and wood ash. If the plants have been seriously troubled with Red Spider during their growing season it will be advisable to dip their foliage in a pail of insecticide before transplanting, and after the latter has had time to dry a copious watering should be given. Keep the lights off the frames for the present and damp the foliage over daily at about 4 p.m.

Spring-flowering bulbs

A large variety of these may now be planted, including Crocus, Snowdrops, Snowflakes, Muscari, Fritillaria, Anemones, Daffodils, Tulips, Scillas, especially S. hispanica, S. campanulata rosea, S. taurica, and S. sibirica, Aconites, such as cilicica and Tubergeni, and that charming little flower from Buenos Aires, Tritelia uniflora, Sternbergia lutea, Tropæolum polyphyllum, Trilliums in partial shade and in a leafy soil may also be planted now, nor is it too late to plant the beautiful Madonna Lily and its Nankeen hybrid, L. testaceum.

Autumn-sown annuals

The ground having been prepared no time should be lost in sowing the seeds, which, however, should be sown thinly. Merely scatter the seeds on the surface and rake them in. They include Collinsias, Bartonia aurea, Godetias, Nemophilas, Cornflowers, Linums, Lupins, Eschscholtzias, Clarkias, Larkspurs, Nigella, Gilia densiflorus, Lavatera, Platystemon californicum, and Violet Cress (Ionopsidium acaule).

Repairs and painting of glasshouses and frames

This necessary work must be no longer delayed, as all such structures will shortly be required for the housing of the many and varied forms of plant life which it would be unsafe to leave in the open air, and houses or frames which, owing to wear and tear, are dripping during inclement weather, are unsatisfactory. All necessary overhauls to the heating apparatus should also be taken in hand now.

Chrysanthemums

The buds of Chrysanthemums which are showing colour must now be placed under cover, a cool, airy house, such as an orchard house, being the most suitable. Attend constantly to the disbudding of later kinds, and where not already done give the plants their final top-dressing, add more stakes if necessary. Large bush plants are vigorous feeders and must be liberally fed with changes of stimulating food.

Late Peas

These are very fine, but mildew is persistent, and must be frustrated by occasional sprayings of anti-mildew wash, which is obtainable from all good horticultural sundriesmen. Ample moisture must be provided and generally by hand, for even following a fairly heavy downpour of rain a dense yard-wide row of Peas will often be found to be quite dry at the root. This also applies to Runner Beans.

Sweet Corn

Much appreciated when well grown is this favourite American vegetable, the cultivation of which is often misunderstood, but in no way difficult. A well-manured piece of ground and a little protection from strong winds, which, owing to the weight of the cobs, will often topple the plants over, is all that is necessary. This is an ideal food for replacing sweet, young Peas where the latter cannot be grown, but a fair amount of moisture is necessary.

Turnips

Several vacancies will now occur where crops have been ripened and removed, and if a scattering of Turnip seed is made, quite a lot of sweet young roots will become available for use during winter, and even if not so required may be dug into the ground later.

Winter Onions, Lettuce, and Spring Cabbage

Sown last month, these should be dusted over occasionally with soot in order to check the ravages of slugs and encourage quick, clean growth. The same applies to late-sown Carrots.

Fruit houses

Expose all which have been relieved of their fruits to air and sunshine in order that the wood may become thoroughly ripened, not overlooking the importance of watering at any time. Vineries containing late Grapes should, however, be kept somewhat drier and more buoyant than of late.

E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Pansy and Viola cuttings

This is probably the most favourable time for securing and inserting cuttings of these popular dwarf plants. They are very scarce as a rule this year, so there is all the more reason for exercising care in both taking them off the plants and in planting them in the frames. Boxes are handy if the number to be handled is only moderate, while in spring it is easy to move them about when the frame is required for more delicate subjects. Label each sort properly and correctly so as to avoid confusion when planting time comes round.

Pentstemon cuttings

The plants, which at one period threatened to be poor, eventually flowered magnificently. So many of the finer varieties, however, have failed to produce many cuttings, and so it will be necessary to hunt carefully through the plants and so secure every shoot that it is possible to make into a cutting. This plant seldom does well if the cuttings are placed in boxes, so wherever possible prepare a bed of nice sweet sandy compost under a cold frame and plant the cuttings firmly in this, allowing 3 inches to 4 inches between them each way. Keep the frame close for a few weeks and shade carefully from all sunshine.

The Scotch Rocket

This delightful plant is by no means easy to increase at any time, but where it is possible to obtain cuttings, this is the best means for attaining this object. Even under favourable conditions the cuttings are very short and demand some care to get them firmed in the soil. A " heel " of the old wood is a great help, so wherever possible sever the cutting in such a way as to secure this. Well-drained, clean 5-inch pots are quite suitable, and should be filled with very sandy compost. The cuttings should be placed round the edges and made as firm as circumstances will permit. Set in a cool
greenhouse, shading from all sunshin
rooted.

General work in the flower garde

Although at times sharp frost abou
date puts " period " to the floral displ
other seasons summer lingers righ
October, so there should always be
deavour to keep everything in the
garden as trim and clean as possible.
and spent flowers should be remove
walks and lawns kept tidy.

Herbaceous Calceolarias

If these be kept in a cool, moist
and protected from the sun, they will
rapid progress and be but little trouble
vermin. If still in 3-inch pots a mov
the 5-inch size will be advisable. Ret
the same frame for a few weeks, on
moving to a frost-proof glasshouse
severe frost is likely.

Schizanthus

If seeds were sown last month the
ing plants will now be fit for transf
to 3-inch pots. Rich soil should not be
and unless for the production of large
mens, one plant to each pot is desi
Where it is determined to grow large p
three seedlings should be planted roun
edge of each 3-inch pot, these in turn
weeks hence being moved to the 4½-inch
Return to the frame until frost thre
when a move to a cool greenhouse w
safer.

The use of the Dutch hoe

As long as the soil remains dry enou
the surface to work freely, this tool sho
regularly plied between rows of L
Onions, Cabbages, Spinach, Wallflo
and indeed everything requiring to be st
built up for winter. Its use also keeps
in check.

Continue to earth up Celery

This crop usually grows very rapidly
ing this month, so some fresh soil shou
added as often as is necessary. A dry
with the soil working freely, should al
be selected for this work. To prevent
getting into the centres of the plants,
one should be tied round with a stri
raffia, but this must be removed agair
mediately the earthing-up is finished.

Late Peas

Where these appear to be unlikely t
well, some little assistance may be g

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

ALPINES

Time to plant Alpine flowers

(Mona).—Early October is the best time to plant these flowers, which quickly take hold of the still warm soil and become established. Planted earlier there is the danger of the plants becoming dried out unless one is prepared to stand over them with the watering-can.

Fifty Alpine plants

(Mona).—Gentiana lagodechiana, G. Farreri, G. sino-ornata, G. Purdomi, G. prolata, Veronica Bidwillii, V. filifolia, V. Lyalli, Vancouveria hexandra, Trollius pumila Wargrave var., Thymus Serpyllum var. coccineum, Teucrium dubia, Trifolium alpinum, Verbena radicans, Viola bosniaca Crimson King, V. gracilis citrina, V. Rose Queen, Wahlenbergia serpyllifolia major, Stachys corsica, Azorella pedunculata, Pentstemon cristatus, Oxalis lobata, Œnothera riparia, Lupinus lepidus, Linum salsoloides, Lobelia linnæoides, Iris Hookeri, Heuchera sanguinea Oxfordii, Gypsophila fratensis, Campanula Miranda, C. Steveni, C. Purple Splendour, Potentilla verna, P. fragiformis, Helipterum anthemioides, Polygala veyradæ, Phlox Douglasi superba, P. subulata Newry Gem.

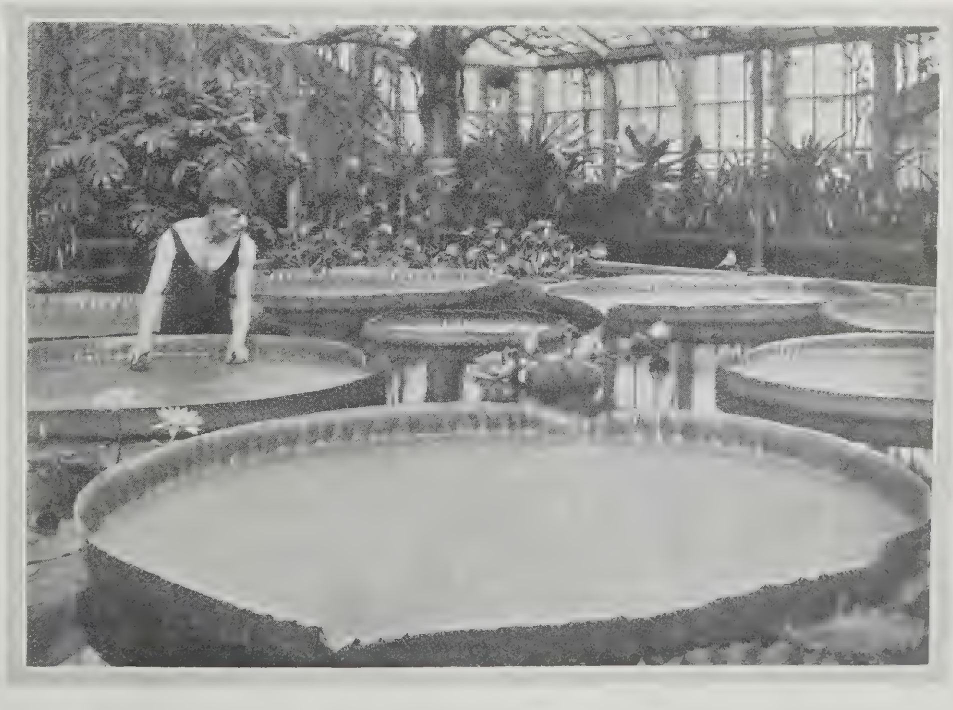
FLOWER GARDEN

Primula foliage

(B. Nash, Surrey).—Your Primula foliage has been attacked by some insect which punctures the leaf and sucks out the cell sap. We have carefully examined the specimens sent, but can find no trace of an insect. It is possible that the damage occurred earlier in the season, and that the insects have left the plants, or that the insect attacks the young foliage as the younger leaves appear. Search your plants carefully and see if you can discover the culprits. Aphis, Capsid Bug or Mite are the most likely creatures to cause this type of damage. Very light fumigation with a Campbell's Sulphur Vaporiser throughout the season would be more likely to assist you than using either liver of sulphur or Bordeaux Mixture. A Campbell Vaporiser can be supplied by any horticultural sundriesman.

Diseased Antirrhinum

(S. L.).—Your Antirrhinum flower spikes are affected with a fungus, Botrytis sp. Fungi of the Botrytis type are common in most gardens, and they usually live as saprophytes, but under some conditions they become parasitic. It occurs to us that the soil



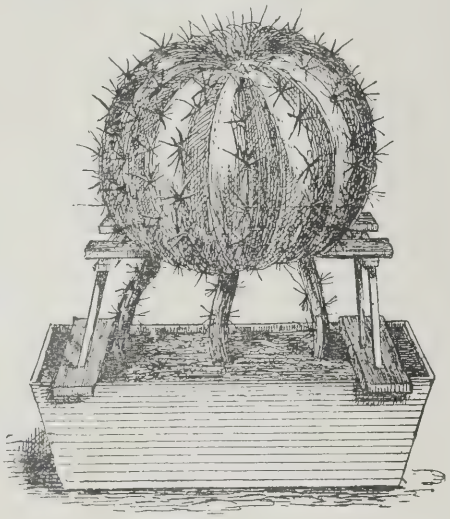
Victoria Regia at Kew
The flowers are seen in the centre of the pool. Leaves are over 6 feet across

From Gardening Illustrated

Fifty Years Ago

A three-legged Cactus

THE subject of the annexed engraving (Echinocactus Pottsii) is one of the monster globe Cacti of California. It is a vegetable curiosity grafted on three stems of Cereus tortuosus, its flowers are yellow, its spines are an inch long and are arranged in sets of seven, one being in the centre. The angles, or ribs, are about 3 inches apart, and the skin, which is thin, is of a beautiful shiny, metallic green.



The head, which measures 18 inches in diameter, is much too heavy for the thin leaves on which it is grafted, and therefore additional support has been given it in the shape of a light framework or stool fixed on the box in which the roots grow. Extensive as Mr. Peacock's collection of Cacti is, no plant in it has been more admired than this, or considered to be, in its way, a greater curiosity.—J. C.—*September 27th*, 1879.

Iris Kæmpferi

This Iris and its varieties are now flowering profusely in Mr. Barr's grounds at Tooting, where there are plants sufficient to produce from 1000 to 2000 blooms, thus furnishing an unprecedented display. One variety, of a rich claret colour, has flowers measuring 7 inches in diameter, its broad falls giving it more the appearance of a large-flowered Clematis than an Iris. English Irises are also flowering abundantly just now in the same grounds.—*August 2nd*, 1879.

Irises in a cut state

What beautiful shades of colour one sees amongst Irises! Spikes of them, cut and put in vases, garnished with a little delicate foliage, are even more effective than the choicest Orchids, both as regards form and colour. Irises are gradually coming to the front again, and it is well they should do so, if for no other purpose than that of supplying flowers in a cut state.—J. G.—*August 2nd*, 1879.

We give it up!

We really do not understand it. It is quite beyond our powers of guessing why people should do so. Here is a Strawberry grower who sends a carefully written letter, the " hand " being neater and plainer than often comes to us. He tells us his method of culture and complains that for three or four years he has had poor crops, and says: " Now being the time to plant, I would like to know what you think is the trouble, and how to remedy it." We could have answered these questions at once on a postcard. " Now being the time of planting," he wants his answer " now "—but he merely signs his letter " A. W. L. ! " Another is in want of a book of recipes. He gives us in full his idea of the kind of book he wants, and finishes his letter by " J. H., City." While an answer to this, being purely personal, would be out of place in our columns, we would have willingly sent it by mail, but " J. H., City," is scarcely definite enough. We have repeated it so often that it should be understood that letters or postal cards without full names merely represent time and trouble lost by the senders.—*October 25th*, 1879.

---

in which the Antirrhinums are growing is on the rich side, having received this season, or in past seasons, fairly heavy dressings of manures rich in nitrogen. Plants never say " No " to nitrogen, but if this element is applied in excess, strong, soft growth, which is easily attacked by fungi, is the result. You can do nothing now to check the trouble other than to cut off and burn the affected portions. When the bed is cleared give the soil a dressing of basic slag at the rate of 4 ozs. to 6 ozs. per square yard, and well dig it in; follow this by giving a dressing of sulphate of potash at the rate of 1 oz. per square yard prior to putting out your next lot of plants.

Primroses failing

(Northerner).—Your Primroses are badly attacked with Red Spider, which has caused the leaves to wither, and unless destroyed, the young, tender leaves now appearing will be disfigured also. This pest has been exceedingly troublesome this season and revels in dry, hot surroundings. Paraffin soap, used at the rate of half a pint to two gallons of water and sprayed over the plants with a fine rose will effect a cure, although two or three dressings may be necessary at intervals of 10 days. Tobacco powder is also effective if dusted over the crowns whilst the latter are damp. Plenty of moisture about the plants is desirable at all times.

Sweet Peas not opening

(H. L. B.).—The most probable cause of your trouble is over-manuring, for whereas some varieties may be able to develop under such a variety of artificials, others would succumb. It is very probable that the roots of the variety in question have at some period of their growth been damaged by the strong acidity of the manures. Another season confine this variety to natural manures, such as
cow manure augmented with a littl
meal, and you should meet with grea
cess.

Blue Iris to bloom in still water

(J. E. Webb).—None of the Iris li
feet in water all through the year, bu
can make a small bed of soil at each

in the cultivation of the crop as co
with the ordinary mode of sowing.
flowers are white.

Dividing and replanting Saxifrag

(H. Mills).—Early October is the be
to carry out this work, the divided
quickly taking hold of the soil wh
latter is still warm.

GREENHOUSE

Time to pot Anthurium Roths anum

(Anthurium).—Potting should be
out before the end of September, ot
it is better left until the middle of Mar
year. The compost should consist of
turfy loam and broken peat in equa
with a few handfuls of Sphagnum
chopped to about an inch in length;
broken potherbs and a little sand shou
be mixed with the compost. Press th
post moderately firm among the ro
grow on in a brisk temperature for
weeks until the roots have taken hold
new compost.

Sowing single Begonias now

(I. E. Mobbs).—Better results will
early spring sowing, and we advise
defer doing so until then. Yes, the
will bloom during the following Au
sown in March or April.

Geranium and Pelargonium

(I. E. Mobbs).—The true Geraniu
hardy herbaceous flowers, and Pelarg
tender greenhouse flowers, the latte
generally referred to—though errone

eraniums. Early spring is the best time ow Pelargoniums, which should bloom ame year. It is rather doubtful whether, u sow now, you will be able to get the s to germinate, but if you do, they ld certainly bloom next year.

nium trouble

heshire Cat).—The Geranium leaves ed in a very dried up condition and d have been better for examination pur- s if packed in a small tin box. As far e can see, the trouble is due solely to pillar attack. Many kinds of caterpillar fall to the ground if the host plant is ly shaken; you might try this plan. If ls, try spraying the plants with a good ticide. The "frass" from the cater- s is usually an indication of the where- ts of the culprits.

TREES AND SHRUBS

ning a trellis

r light and well-drained soil in sunny t I want to clothe some 12 yards of s about 5 feet 6 inches high. Roses, of e, immediately suggest themselves, but e climbing sports of the various Teas H.T.'s make sufficient growth ade- ly to clothe a trellis, or would I do to rely on Wichuraianas? Roses are he sole idea I am prepared to consider, f you can suggest alternatives I shall be ful. What I am looking for is fragrance, r, good foliage, and a fairly vigorous th. Perhaps a tall order, but maybe you give me a list of Roses and such other s as you may think will fill the bill.

FLOWER LOVER.

here can be no doubt about the vigour ny of the climbing sports of some of our known Roses, and we should expect, Climbing Caroline Testout, C. Mrs. J. Grant, C. Mme. Isaac Periere, C. ral Macarthur, C. Ophelia, C. Mme. Chatenay, C. Gloire de Dijon, C. Mme. ie Soupert, C. Zephirine Drouhin, and merican Pillar to give you pretty much you aim at. Regarding an alternative of other climbing plants, this is not so as your specification embraces so many practically unattainable in any parti- plant. However, we personally would r planting some of the hardier Clematis en the Roses, thus securing much r variety of form and colour, although l of these have fragrance. Some of the es are very beautiful in their season, lso lack scent.]

ering shrubs for town garden in oor soil

).—Spiræa arguta, Caragana ar- ens, Cytisus scoparius, Teucrium ns, Hypericum patulum var. Henryi, eia variabilis magnifica, Kerria ica, Rosmarinus officinalis, Ulex eus flore pleno, Cistus ladaniferus, C. iensis, Rhododendron pontica, Osman- quifolium, Berberis Mahonia, Berberis is.

s Pissardii

Howard).—It is not unusual for this s to produce fruit such as the one y you.

tis dying off suddenly

anything be done to prevent Clematis down? I have planted dozens during st six years and I find that they in- ly die down within a few months of g out. They usually start up again the bottom, but sometimes die down three times before making up their to go ahead. I have one that has just own to the ground, but is throwing out new buds from the bottom. It was planted three years ago and is a Jackmanii. It has covered a wall 10 feet by 7 feet twice in that time and then died right down again. The sub-soil here is chalk, with very little soil above, but I always dig a good pit for them and fill it with rotted turf and sand.

"MEIKTILA."

[Your experience with this beautiful genus is, unfortunately, that of many others, and we are, at present, as far away as ever from a cure. Some of our best authorities who have been experimenting with them for many years attribute this dying off to grafting, the stocks used being unsuitable. Over this point a great deal of controversy has arisen from time to time. Own root plants, however, should be obtained whenever possible, as these certainly appear to have a much longer life. Plants may be layered in March. In Nature the Clematis thrives on the fringes of woods and copses, generally spreading its canopy of bloom over the branches of low-growing trees and shrubs, its roots and main stems being protected from sun and wind. The Clematis has several enemies, which are sometimes the cause of its death, but this sudden dying off, even when in full bloom, is a very common and more serious matter, for which, up to the present, there is no certain preventative. Many people have, for this same reason, given up trying to grow this lovely race of climbers. We advise you to grow species, some of which, if smaller individually as regards their flowers, bloom with such remarkable profusion that in effect they are equally beautiful and have none of the failings above described.]

Bark bound

(M. N. Norris.)—Your trees must either be planted in too rich soil, or else the ground is badly drained. The latter, in particular, very frequently causes the trouble you complain of. The remedy is obviously to have the ground properly drained, should the last-named be the cause, while over-richness will in time remedy itself, if no more manure be applied. We do not favour scoring the bark, as this so frequently leads to canker, which is, of course, worse than the trouble it is hoped to cure.

Creepers for north-west and north-east walls

(Shrub).—For the north-west we suggest the following:—Clematis Armandii, C. Nellie Moser, C. Ville de Lyon, Aristolochia sipho, Actinidia Henryi, Paul's Scarlet Climber Rose, Rose Mermaid, Lonicera etrusca gigantea, Jasminum officinale, and Stauntonia latifolia. For north-east:—Trachelospernum divaricatum, Vitis Coignettiæ, Ceanothus dentatus, Clematis Jackmanni superba, C. montana rubens, Actinidia arguta, Lonicera, late Red Dutch, Rose Bouquet d'Or, Wistaria chinensis.

VEGETABLES

Shallots

I have grown some Shallots from seed. Some have grown rather large and some are a nice planting size. I have been told that if I plant these they will do no good, and will run to seed next year. Should be pleased if you could give any advice on this.

J. W.

[We do not favour raising Shallots from seed, mainly because this plant never breeds true, but we do not think that if you plant fair-sized bulbs raised in this way that they will run to seed. Plant in rich, well-worked soil.]

Uneven Cauliflowers

(H. W. Hobbs).—Cauliflowers dislike loose soil, so it may be you have failed to have the ground firm enough. Giving water in driblets, even if every day, is useless. What you should do is to give a thorough soaking about twice weekly during dry weather. If the ground was really well manured, no further feeding should be required, but in the event of the plants showing any sign of want of vigour an occasional soaking of liquid manure should do a world of good, this being applied the day following a soaking of clean water. Again, you may be growing inferior varieties. Have you tried Early London, Early Dwarf, Erfurt, Sutton's Favourite, and Veitch's Autumn Giant? These are all excellent, well-tried sorts.

Potato Scab

(Gardener, Monmouth).—The Potato specimen sent for examination is affected with Common or Surface Scab. Please see reply to "Weybridge," on page 617 of our issue for September 7th. Your best plan would be to sow a crop of Mustard, give the crop a dressing of one part sulphate of ammonia, one part sulphate of potash, and three parts superphosphate at the rate of 2 ozs. per square yard when the crop is well through the soil. You will know your own district; if you think it is not too late, sow the Mustard at once, but if you are doubtful about the crop growing big enough to make it worth digging in, defer the sowing until early spring. It appears to us that your soil is in very poor condition.

FRUIT

Bitter Pit of Apple

(Gardener, Monmouth, and S. C. W., Wimbledon).—Your Apples are affected with Bitter Pit, a trouble not due to fungi, but to some physiological cause, probably in both cases soil deficiency. This autumn give the trees a dressing with an equal mixture of a good grade basic slag and kainit. Mix the two manures thoroughly together and apply at the rate of 6 ozs. to 8 ozs. per square yard. After application, fork in the mixture several inches deep. This manure should be used in addition to any other manure you usually apply. Repeat the slag and kainit treatment for several years if you can see any improvement in the growth of the trees and the condition of the crop.

Small Apples

("Gardener").—One of two things has happened to cause your Irish Peach Apple to behave in the way it is doing—either the ground is badly drained and the roots have got into sour and inert soil, or else it is so impoverished that the tree has not a chance to thrive. If the last-named trouble is likely to be the true one, a generous mulching of well-rotted farmyard manure all over the roots would quickly help matters, but bad drainage is more difficult to tackle. We are afraid that nothing can be done to save the old tree you mention. Remove all dead wood from both trees.

MISCELLANEOUS

Corrugated iron and plants

(Rev. A. L. Kynaston).—No, the iron will have little or no effect upon the plants unless exposed sheets of it stood erect with plants touching it in exceptionally hot weather, when there might be a tendency to a scorching of foliage actually touching the metal, which, as you are probably aware, gets exceedingly hot. There will certainly be no ill-effects from its contact with the soil.

Cheshunt Compound

(I. A. C.).—Cheshunt Compound can be used in solution either as a soil drench to vacant ground or to growing plants. Because of varying local conditions it is always a wise precaution to test all fungicides on a small scale at first, and we advise you to try the material on a few plants. If you find that the foliage, as well as the roots, will stand the solution, it would be an additional advantage. Usually Cheshunt Compound is not used on foliage.

Insect pests in India

(P., Lancaster).—In England the only practical way of dealing with wasps and hornets is to search for and destroy the nests. As you say, the pest can be dealt with on a small scale by bagging fruits, but on a large scale it is unpractical. The Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W. 1, publish a useful leaflet on wasps. The leaflet is styled, "Miscellaneous Publication No. 44." A copy can be obtained from the above address at the price of 4d. post free in England. Under our conditions, the larvæ of the Cockchafer beetles do much damage to the roots of plants, but the adults feed almost entirely above ground. The best control for Cockchafer larvæ is to apply crude naphthalene at the rate of 4 cwts. per acre. Apply the chemical evenly over the surface of the soil and then dig it in as deeply as possible.

Cesspool

(Puzzled).—The contents of a cesspool if diluted and used on certain crops is a valuable form of manure, provided it can be used in places where the smell is not objectionable. The material is often used on land which is vacant, and after the liquid has drained into the land the solid portion is dug in. Most frequently, perhaps, the material is used on grass land and allowed to wash in. Mixing a disinfectant with the material would spoil it for garden or farm use. We think your best plan would be to consult an expert sanitary engineer, who would be able to advise you as to the best method of dealing with the cesspool. The construction of a septic tank seems to us advisable if you cannot deal with the material as outlined above.

Enquiry correction

Diseased Plums ("T. C. C."). Last sentence on page 616 of our issue for September 7th should read: Please see reply to "Puzzled" in our issue for August 31st.

NAMES OF PLANTS

W. Peachey.—1, Senecio clivorum; 2, Centaurea glastifolia; 3, C. macrocephala.

W. D. Linsell.—Silene orientalis.

Meiktila.—Cannabis sativa (Hemp Plant), a vigorous annual, largely cultivated for its fibre.

J. F. Cummins.—1, Campanula Steveni; 2, C. muralis; 3 and 4, Gentiana lagodechiana, which varies slightly when raised from seed.

William Myall.—1, Sedum kamschaticum; 2, S. grandiflorum.

D. Moran.—The shrub is most probably Rhododendron amœna, but flowers are necessary.

H. Mills.—1, Gentiana asclepiadea (the Willow Gentian); 2, Thymus Serpyllum; 3, a Veronica, but flowers are necessary; 4, Convolvulus mauritanicus.

L. C.—1, Phyteuma orbiculare (Rampion), found on chalk hills of S.E. England; 2, Galium verum Lady's Bedstraw; 3, Scabiosa columbaria, found on calcareous soil; 4, Comfrey Symphytum officinale.

Young, Milngavie.—Specimen dried up. Probably Lilium testaceum syn. L. excelsum, the stately Nankeen Lily.

D. G. M.—Probably Spergula sativa (Corn Spurry). Not uncommon in cornfields.

"Anthurium."—Fern Onoclea sensibilis.

D. G. M.—A lax form of Scleranthus annuus L. Knawel, a well-known British plant not uncommon in sandy and heathy ground. Family, Illecebraceæ.

M. E. Feenyson.—Hypericum kalmianum.

T. W. Collins.—1, Probably Pyracantha coccinea, but a better specimen is necessary; 2, Berberis vulgaris; 3, Euonymus europæus; 4, Acer negunda.

W. J. Colwell.—Leycesteria formosa.

A. J. B.—1, Salvia pratensis Tenorei; 2, Rudbeckia purpurea; 3, Helenium grandicephalum striatum; 4, Centaurea montana rubra; 5, Centranthus rubra; 6, Helenium Riverton Gem.

Dartmoor.—1, Epilobium mummularifolium; 2, Hydrangea paniculata.

NAMES OF FRUITS

A. W. F.—Apple Beauty of Bath.

G. C.—1, Mannington Pearmain; 2, Stirling Castle; 3, Worcester Pearmain; 4, Ecklinville.

W. B., Chigwell Row.—A, Brown Beurré; D, Princess. Others immature and not recognised. Kindly follow conditions for naming fruit and send fair samples.

Persian Cyclamen

A WELL-GROWN batch of this beautiful winter-flowering plant is a joy to all flower lovers, and as the best time for making a start is in late August or early September, a few notes on the necessary procedure to ensure success may not be out of place at this time. Those having very good, lightish, fibrous loam will find that this good sweet leaf-mould and sufficient silver or other clean, sharp sand will give excellent results, using three parts, two parts, and one part respectively. Others not so happily placed would do well to include a little brown fibrous peat in the mixture. Thoroughly clean and dry 9-inch pans are very suitable for this purpose and should have the drainage carefully arranged, and this again covered with the fibrous portions retained in the riddle when sifting the soil. A ¼-inch riddle should be used, and all ingredients well mixed together. Fill the pans to within about half-an-inch of the brims and make nicely firm. If one has patience and plenty of time to spare the seeds can be put in singly half-an-inch apart, but otherwise scatter thinly and evenly, pressing gently into the soil, and then covering with about one-eighth of an inch of the compost. Again press down moderately, leaving the surface nice and level. Give a gentle watering through a fine rose, cover each pan with a piece of glass, and lay over that a sheet of newspaper. A house or pit having a gentle warmth of about 60 degs. will suit nicely for germinating the seeds in, and indeed for bringing on the seedlings during the winter. While the soil must never get really dry, too frequent applications of water are very harmful. Some growers advocate the pricking-off of the seedlings as soon as fit to handle, but I think that equally good results are had by deferring this operation until the little plants show four leaves, this being usually in February. At whatever time pricking-off is carried out, I think that thumb pots filled with soil very similar to that advised for sowing the seeds in should be prepared, a very slight dusting of Ichthemic Guano being added unless the loam is of specially fine quality. Return to the same temperature for a week or two until the tiny plants recover from the shift, but when growing freely move to a house hav
somewhat cooler temperature. From n
lightly spray the little plants overhead
daily. As soon as the thumb pots are
filled with roots, move to those of the
or 3½-inch size, giving the same compo
used in a rather rougher state. Very
watering is necessary all through the gr
and flowering seasons, while shade fr
direct sunshine is imperative. The
shift must take place when the 3-inc
are well filled with roots and not before
same ingredients should be used, but
occasion no riddling should be atte
unless to eliminate some of the finer p
of the soil. Should there be an undue qu
of such present, the whole may be
with a ¼-inch riddle, the rough porti
course, being retained. Good resul
sometimes had by including about one-
a part of quite dry cow manure, but I
favour a 5½-inch potful of Thomson's
Manure to each barrow load of the ot
gredients, while, in any case, a 6-inch
of bone-meal to the same quantity
should be included. For the strongest
6-inch pots should be used, medium
mens being afforded the 5½-inch size, a
weaker ones the 5-inch. All should be
clean and dry, and with a fair quan
carefully arranged crocks in each so
ensure thorough drainage. Return to
quarters, water with the greatest car
shade from all sunshine. During su
a shady cold frame will suit the pla
care be taken in watering, airing, and
ing. When the pots get well filled with
a little gentle feeding may be given, b
must not be over-done, either in reg
strength or frequency. Green Fly,
and the Begonia Mite are sometimes tr
some, but an occasional vaporising with
tine will prevent these pests doing
harm. During winter watering must b
carefully carried out and in such a way
prevent any moisture settling in the
of the plants, for when it does d
follows, the flower-buds all shrivelli
and so failing to open. C. B

E. BURRELL.

Removal of Cinerarias from frame to greenhouse

AMONG plants which make for beauty in the greenhouse during winter and spring, few excel in point of splendour the rich, spreading panicles of Cinerarias. Many grow them well up to a certain period, and then failure sets in, and this is often due to a reversal of treatment from open air or cold frame culture. It is this radical change to indoor conditions which marks the retrograde movement of many promising plants. Those who have grown Cinerarias successively know quite well how impatient they are of sunlight falling on the leaves when in a cold frame in summer, how the leaves soon commence to flag, and it is not until evening, when cooler conditions prevail, that they resume their normal conditions. A good grower will see to it that pots are stood on cool material, such as ashes, in order that moisture may be conserved about the roots, and further, that abundance of air is given the plants by tilting, or removal of lights during some portion of the day and on warm, summer nights. As far as is possible this condition of things should be continued when removal is effected to the house. The question is sometimes asked, "Can I keep Cinerarias in frames until late in autumn?" Obviously it depends on several things, the first being the locality where one lives. If mild, one can often keep them in frames until October, but preparations ought to be made to afford them shelter with bags or mats should the nights be very sharp. If the plants are small it is best to err on the side of earlier housing than run any chance of losing any by frost. Plants that have become established, say, in 6-inch or 7-inch pots, and the roots of which have got well round, may be left to the last, although if there is room available in the house there is no very great gain in keeping plants in frames that would be more secure when removed. The greenhouse stage may be made up of wood laths. It is not convenient to put zinc trays on it, but a good makeshift will be found by partly filling shallow boxes with fine ashes or grit and standing pots in these. When Cinerarias are placed on stages with heat pipes running under, it tends to excite them, and they commence to go limp and lack vigour. The cooler they are kept when in the greenhouse the better, just enough heat being given to dispel damp and frost. Many a day in autumn the house may be freely ventilated, and even at night roof ventilators ought not to be entirely closed. It is customary to grow the plants either for autumn or spring flowering by sowing seeds in February or May, but in whatever stage the plants may be at the moment, ere long greenhouse shelter will be needful.

Cinerarias, when the roots have permeated the soil, take a good deal of moisture in the shape of clear water, followed by weak applications twice a week of liquid-manure, and this ought to be given in a morning to allow for evaporation. Further than this, it is important to give each plant what room is possible, avoiding at all costs packing them close to each other, as, to do so, either breaks or bruises the leaves, which add charm to good panicles. After many years as a grower I have found out that if plants are given a long period in a cold frame in summer under cool conditions as described, and this is aimed at as far as practicable when removal to a greenhouse is effected, there is more satisfaction in the long-run than when the treatment is reversed. Cinerarias are almost hardy, and if one goes beyond this point by placing them in dry, heated structures, one is almost sure to court the entry of either Green Fly or Red Spider. There are excellent strains one can select to-day, from large-flowered to Cactus, and stellata, with a great range of colour, which will keep a greenhouse very gay over many months if seed is sown at intervals.

MIDLANDER.

Planting and cropping

THE most economical system in the vegetable garden is rotation cropping, both as regards the produce and the soil in which it is grown. By this method every square yard may be made to produce two main crops in the year—from spring to spring. If adhered to for three years the results will be very good, but a change every two years will be better than growing the same sort of vegetable on the same plot year after year. Many a plot is now being cleared of Potatoes and will form the largest to be recropped. All the haulm and weeds having been disposed of by burning, it only remains to level the ground before planting the next crop. There is no need to add any manure, for the soil will be in good condition for winter greens. Where the soil is of a clayey, retentive nature, there is no necessity for firming, but where the staple is light, a good treading will be of great benefit. At this season of the year the growth should not be forced too much, for if the coming winter should prove to be severe, most of the gross plants would be killed. For winter greens a moderately manured, firm soil is ideal. I notice in many gardens that winter greens are frequently planted between rows of late Potatoes, a very bad system indeed. Where this method is in practice the Potatoes should be lifted with the least possible disturbance of the roots of the plants. Afterwards tread the soil firmly about the stems of the plants and draw the soil up to them as if they were a row of Potatoes. Where the stems have become unduly drawn up frost always attacks them, therefore earthing-up not only steadies them, but protects them from severe frost later on. Before planting the greens it is a good plan to dress the plot with soot, raking it well in. It is not too late to plant Brussels Sprouts to yield a crop in late spring. For these and Broccoli the distance between the rows should be 3 feet and 2 feet between the plants in the rows. For Savoys 6 inches less will do, but the Drumhead variety requires the former space.

Winter greens to "follow Peas" do remarkably well. In the case of there not being any ground occupied by Peas, and the plot to be devoted to them is poor, fowl manure, if possible, should be used, say, at the rate of two pecks to the square rod. It should be buried quite 8 inches or 9 inches deep, as, being of a very burning nature, it must not come in direct contact with the roots when newly-planted. Spring Cabbages do well after Onions. The soil for the Onions is well manured and trenched, therefore there is no need for further manuring. When the surface has been cleaned of weeds, apply two pecks of lime per square rod. Dig the lime well in, break up and level the surface, tread and rake it. It may then be left until planting time in September. If Cabbages are not required, the plot may be planted with Sprouting Broccoli or Savoys. One of the most valuable crops in the vegetable garden are autumn Onions. These will give nice firm bulbs in June, when stored Onions are past their best. They may occupy the site of the Peas. Where the soil is naturally good, only a small q of manure need be dug in a foot deep ing the surface with soot. The seed sown on the plot and the thinnings planted on another site similarly prep the end of September or beginning o ber. Except on very heavy, clayey some treading will be required, doi at sowing time in August.

On a plot cleared of Shallots a most green crop to plant is Rosette Colewor the rows be 2 feet apart and 18 inche inches between the plants in the row surface only will need loosening, ground will be firm enough. If the fairly rich it will only need dressin soot. As Coleworts are really mi Cabbage, they may be used for greens they form hearts.

Very valuable are the two crops and Winter Lettuce, not only in the garden, but in the small one of the an They may be raised from seed very and do not take a great deal out of th Transplant the Lettuces as soon as p into their permanent quarters, allow inches each way between the plants. good varieties are Continuity and Year-Round. Vacant Potato groun suit them admirably, and if organic m was used for the Potatoes the soil quite rich enough. The seeds shou sown for the latest crops, both Lettu Endive, on the plot on which they mature. The best kinds for wint Batavian and Green Curled, which sta weather very well. Plant out or thin a distance of a foot each way. Turni do well after Potatoes. Some growers cate sowing broadcast, but I do not co it a good method, as the cleaning of th cannot be properly carried out. Th should be levelled and cleaned so th crop may be properly attended to as t ing, clearing, and thinning-out, th having been sown in drills. The roo be ready for use in about two months or may be stored for several months.

F.

Celery and Leeks

The earthing-up of these important tables demands constant attention a more than 4 inches of soil should be ad any one operation. The stems havin been gathered closely together the new must be pressed very firmly around Watering is now more difficult, but overhead waterings will eventually find way to the roots and maintain the pla a healthy condition. Spray the plants anti-rust periodically.

LATE NOTES

Michaelmas Daisies

These should be carefully staked befo September gales commence, for onc plants have been beaten to the ground i be impossible to stake them with satisfa When staking, endeavour to spread ope centres of the plants in a light and gr manner, and thereby add greatly to beauty when in bloom. Plenty of moi about their roots and a little stimulant sionally will prove most beneficial.

Double biennial Wallflowers

These seldom survive the winter nor the Tweed, but they make splendid pot p if lifted now with good balls of eart tached to the roots. If the plants are a size the 7-inch size of pot will be foun cellent, while the 6-inch will accomm those of lesser size. Pot firmly, using good compost for the purpose, and set shady place until the effects of the liftin thrown off.

'Phone: Syd 1268. SHOWYARD OVER QUARTER MILE LONG. Established 75 years.

"OXFORD ROADLESS" BARROWS

are ideal for carrying loads over soft and uneven ground which an ordinary wheelbarrow cannot face satisfactorily

A high-grade production constructed of thoroughly seasoned timber.

Type "G" (illustrated) - -	£3 7 6
Grass extension - - -	10 0

The following are extracts from a few of the many appreciative letters received:

"The barrows have been in daily use for the past ve months under all conditions, viz.: over rough, smooth, and oggy ground, and we have pleasure in testifying to their fficiency."

"I have nothing but praise for your Creeper tracks, specially on a three-creeper truck which you made for me a ear ago, and I cannot speak too highly of its work."

"We now have a good many of these barrows in use, nd they are a great saving in labour. We would not be ithout them for anything."

"Nearly twelve months ago we purchased a barrow tted with one of your track wheels. We found this very seful, and far superior to the old style of wheel."

Where

can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to —

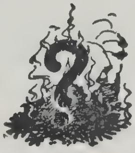
THE LEADING FUMIGANT
SOLD BY NURSERYMEN AND SEEDSMEN.



A BURNING QUESTION
Do not burn your garden refuse; it is wasteful. Ensure a supply of excellent organic manure by treating lawn mowings, leaves, weeds, and general vegetable refuse with ADCO. Results prove that Synthetic Farmyard Manure made by the ADCO PROCESS is the most effective substitute for animal dung. The manure shortage is a serious question, but
ADCO WILL ANSWER IT
ADCO and water added to refuse as it accumulates will produce a rich clean manure in from two to six months; thousands of tons are made annually by gardeners, farmers, fruit growers, nurserymen, schools, and institutions.
One cwt. of ADCO makes 2 to 3 Tons of Manure

Stictite

Safeguards the Fruit Crop

By trapping Winter Moth, etc., Stictite prevents the laying of thousands of eggs which would otherwise hatch out in the Spring and do serious damage to the fruit.

Winter Moth appears early in October, so that Stictite should be on the trees by the end of September. 1 lb. of Stictite will do 10 to 20 trees according to diameter.

½ lb., **1/6** (post. 6d.); 1 lb., **2/9** (post. 6d.); 2 lbs., **5/-** (post. 9d.); 4 lbs., **10/-** (post. 9d.); 7 lbs., **17/6** (post. 1/-).

Greaseproof Paper, 5 ins. wide:—6 yards, **2d.**; 12 yards, **3d.**; 25 yards, **6d.**; 50 yards, **9d.**; 100 yards, **1/6**; 200 yards, **2/6**.

Write for Descriptive Folder

Stictite is sold by Nurserymen, Seedsmen, Florists, Ironmongers, Chemists, and Stores. If any difficulty, please write to Abol, Limited, 11, Beltring, Paddock Wood, Kent.

pecies is very large, and a clump
very beautiful appearance when in
September and October. The next
r is

HELLUS, which is an exquisite little
ffering entirely in appearance from
oing and charming us more by its
t than its brilliancy. The typical
the flower is described as bright
ac, with the outside of the outer
self-coloured, the inner segments being marked with five narrow dark purple lines. There is also a white variety. The flowers vary much, ranging from almost white to the bluish lilac, which is the typical colour. C. pulchellus flowers very freely from September onward, and increases quickly by young corms and by seeds, which are very freely produced. Besides occurring on Mount Olympus, it is said to be plentiful in the thickets bordering the Bosphorus. The third species—

C. SPECIOSUS—is, perhaps, the best known of the four. This Crocus is very distinct in appearance from the foregoing, and from its colouring and the size of its flowers is remarkably effective when grown in quantity. It is an early bloomer, flowering generally early in September. The flowers, which are large and open widely to the sun, are of a colour variously described as bluish violet, bluish purple, and bright lilac. Possibly the second most nearly approaches the shade. The segments are prettily marked with dark purple veins. These, with the bright orange anthers and stigmata, add much to the effect and beauty of the flowers. It is widely spread in a wild state, occurring in North Persia, Georgia, the Caucasus, the Crimea, Hungary, and Transylvania. Although the best known, and said by Maw to be a common garden plant, there are thousands of gardens where it is unknown, and where it would be a cherished flower planted in the grass, the borders, or the rock garden. C. speciosus Aitchisoni is an exceedingly fine variety, eclipsing in size the type. Generally speaking, there does not seem to be much variation in C. speciosus. Of the last of the four—

Autumn Crocuses (Crocus speciosus) and Ferns

C. ZONATUS—it is hardly possible to speak too highly. It is an exquisite little Crocus, with rosy lilac flowers, with an orange-scarlet base. It flowers early—from the middle of September in good positions. It comes from Cilicia, where it was discovered in 1855. This beautiful little member of the genus requires little or no care, and will give much pleasure to its owner from year to year.

A desire to speak at greater length of four fine Crocuses such as these must necessarily reduce the space available for the numerous species not yet mentioned. Among the white autumn Croci we have Boryi; cancellatus, which has a purple base, and of which there are several varieties, including some with lilac flowers; hadriaticus, with its variety chrysobelonicus, which has a yellow throat; and ochroleucus, a creamy white flower with orange base.

C. ASTURICUS, of which there are some good varieties, varying from purple to lilac, is also a good Crocus.

C. LONGIFLORUS is a pretty, free-blooming species from South Italy, with soft rose-lilac flowers.

C. CLUSII is a good Crocus with comparatively large flowers and quite hardy, although it increases rather slowly. The rare

C. VALLICOLA is difficult to establish and is rather disappointing. It is thin in the segments, and the flowers are neither pure white nor a good cream colour. It has the reputation of being among the earliest to flower. A coveted species is

C. SCHAROJANI, which, did it thrive, would give us the yellow species we desire among the autumnal Crocuses. Coming from an altitude of 7,000 feet, it should grow with us in Great Britain, but one must wait for fresh importations.

C. NUDIFLORUS is a fairly well known

species in some districts, and is said to be naturalised near Nottingham. It has bluish purple flowers.

C. SALZMANNI has lilac flowers and dark-coloured feathering.

C. MEDIUS is purple-lilac, and

C. TOURNEFORTI has delicately tinted rose-lilac flowers. The old Saffron Crocus—

C. SATIVUS—is fastidious in its ways, and in many gardens refuses to bloom after the first year. Possibly lifting annually and drying off might remedy this, but with so many other good Crocuses it is hardly worth while to trouble doing this.

CULTIVATION.

Their great requirements in our climate are sun, shelter, and a rather light soil. The first two are of primary importance for flowers coming when sunlight is becoming scarce and when the winds of autumn are playing havoc with the flowers. Sheltered sunny places on the grass, cosy corners in the rock garden, or borders sheltered from high winds will suit them well. If the grower care to be at the trouble, he will find that a bell-glass or sheet of glass overhead some choice Crocus will give him the enjoyment he seeks ofttimes when without it the flower would remained closed. With a few clumps of such flowers as these showing among the grass or through some mossy Saxifrage or other surface-rooting plant, the shortening days need be no longer unrelieved by the brightness of dwarfer flowers than the Asters and their few companions of tall growth, which form the sole interest of many gardens at these times.

Colchicum Bornmuellerii magnificum

The finest of my Colchicums at present is the one called C. Bornmuellerii magnificum, which emanated from Van Tubergen's nurseries. It was exceedingly fine last year, but this autumn it is even finer and surpasses any of the good Dutch hybrids which I have. C. B. magnificum has very large cup-shaped flowers of glowing purple and with an ivory white centre. It came in a little later than the typical C. Bornmuellerii, but I think all the Meadow Saffrons are earlier than usual with me this year. S. ARNOTT.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Rose Mme. Alfred Carriere

AMONG the older Roses is one which, if space can be given it to develop, should be in every garden. Mme. Alfred Carriere has all the best virtues of the queen of flowers. Healthy, free, and graceful in growth, the flower is blush, shading to white, and is also fragrant, long-stalked, and lasting in water. Besides giving a mass of bloom in early summer, the bush can be relied on to provide us with a second supply in autumn, lasting till frosts put an end to its activities.

Like most of its family, it prefers a fairly heavy soil, but does quite well on a light one. Except for cutting out dead wood, the pruning should be of the lightest. K. M. R.

Tilmanstone.

In Mrs. Rice's garden at North Court, Eastry, Kent

A glorious Dahlia

I wish to call special attention to a beautiful Pæony-flowered Dahlia named Radium. This variety is classified as a miniature-flowered Pæony, but it is really too large glorious Dahlia planted together, and they present an appearance that I think it would be difficult to beat. The plant attains a height sent an appearance that I think it would be difficult to beat. The plant attains a height of about 3 feet, and flowers quite freely. Each bloom is carried on a stiff, erect footstalk, and looks you honestly in the face. With me the blooms are fully 5 inches in diameter, and their rich and brilliant crimson-scarlet colouring is the richest I know among all the Dahlias. If I had only one Dahlia to grow, this variety would be my selection. D. B. CRANE.

Roses for a five-foot fence

In a recent article on friendships which have begun by the accidental discovery of like tastes in the garden, attention was drawn to the lack of appreciation of the red semi-climbing Rose Souvenir de Claudius Denoyel. May I emphasise the fact that this is a neglect both to be regretted and to be remedied in the coming planting season, and also to express my own thanks to an unknown correspondent in "GARDENING ILLUSTRATED" who pointed out the value of this excellent Rose about 18 months ago?

I had a fence planted with Gruss an Teplitz for about 10 years, and satisfactory as the old stagers generally proved, they became somewhat worn out. I replaced them, rather loathly, with Souvenir de Claudius Denoyel and Pax. I had seen neither, but had that supreme faith in next year's results which is the life-blood of all true gardening. Both were a delightful success from the first, and in gratitude I should like to hand them on to those who are seeking something unhackneyed for a 5-foot fence. The short-named Rose is not new, but is also neglected beyond its great deserts. On a poor Rose soil with me the habit of growth, length of flowering season, beauty of flower are all most satisfactory. The op are rather thin—no, let us be qui Mr. Editor, they are more than r but the opening buds in sprays of si well spaced and individually very sh of an exquisite pure cream. In ad foliage is excellent in constitution ing in appearance.

I have used the word satisfact scribing these Roses; it is not a word, but, then, I am not compili logue, and I would like to leave it they are indeed satisfactory.

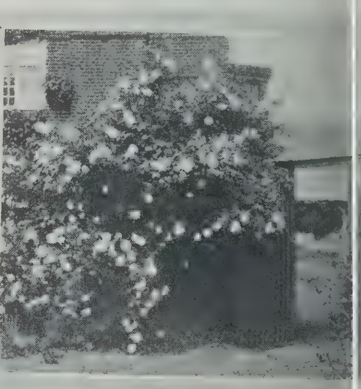
Strawberry runners for spring

My frend, Mr. Blair, rightly sa issue of September 14th, in his "Weekly Notes") that runners late in being fit to lift this autumn not an infrequent occurrence in ou climate, and, a good many years ag a scarcity of the orthodox runners an experiment which proved so en



Rose Mme. Alfred Carriere North Court

cessful that I have adhered to it e Briefly, in renewing Strawberry pl instead of depending upon runners, strong and healthy plants and divi into single crowns, just as one d herbaceous border plants. Thes crowns, I am convinced, give equally returns as runners, and as they cropped in the succeeding year the to me, appears to be commendabl method of renewing Strawberry bed sanction of our predecessors.

A SCOTTISH GAR

Flavour in Gooseberries

Although "W. B." (page 622) leg, I will try and be as helpful to I can. He asks which is the best Gooseberry. If he will write to Mess yard, The Nurseries, Maidstone, fo of their fruit list, he will find no 57 varieties there, fully described, a tion is, in each case, made of the fl the variety. F. HERBERT CH

—— Thank you, "W. B.," for t bouquet. Gooseberries pay for g tivation. I will not trouble you wit list of Gooseberries, but mention th which, when well grown, are extrem in flavour, viz.: Langley Gage Langley Beauty (pale yellow), ar favourite, Lancer (large, pale green)

GROSSU

—— It is, I think, agreed tha Scotland produce the best flavoured berries, just as it is agreed that our further south in Lancashire prod largest members of that family. As case of Pears, the question of fla erries must, necessarily, be largely individual taste. Personally, I am rtial to Early Sulphur, equally so en Gascoigne. Whitesmith and nith are good dessert varieties; so, the old Gretna Green and Hedge- f red Gooseberries, no one can cavil flavour of Warrington or of Whin- ndustry, but these must be dead ripe operly appreciated. Other good ber- far as flavour is concerned, are Lion, Keene's Seedling, and the old ng Red—the latter synonymous, I with Ironmonger—being delicious solutely ripe. But, as I have said, ch depends upon the taste of the r. A SCOTTISH GARDENER.

Hop (Humulus lupulus)

OOD variety of this native plant, h as is grown in the Hop grounds of Kent and Sussex, should find a place ere in the garden; nothing is better ring any rough fence or hedge. An e unsightly wire fencing of the tall ibable" class covered with a Hop ome a beautiful object in the late In some suitable place in the gar- lant can be led up an arrangement tall bean poles driven into the ground a way as to come together about 3 and then spread into an equal tri- th the tops 5 feet apart at the top, e Hop is guided to form garlands to top and also to fall in flowering at the sides. Fresh growth is made ar, and so vigorously from a well- ed stool that a good number of the rowths should be removed when it a yard high. The upper leaves that ong the flowers are small and un- and show the relationship of the plant to the common Nettle and to the Elm; but the lower leaves are large, five-parted, and much like Vine leaves. It can also be made to serve in various ways for room decoration. G. J.

Mechanical cultivation

I have been much interested in the letters on this subject by "A Scottish Gardener" and "Jack." My sympathies are naturally with the latter, as my object in writing the original letter was to elucidate opinions, which I hoped would be favourable, and experience, which I hoped would be comprehensive. But none of the hundreds of users of motor cultivators of whom "Jack" speaks have so far given their experiences, and it is in the hope of elucidating these that I now write.

It may be useful to enlarge on my position. The garden in question lies in the north-east of Scotland and during the war was very much let down. The arrears of those years, especially in "the policies," have hardly been overtaken. The garden being considerably larger than my purse, the staff cannot be increased. The only way to overtake arrears is by a larger output of work. The only way to achieve this, an increase of staff being barred, is by mechanical means. A motor mower was the first investment, and soon proved its worth. A mechanical saw was the next. This, while not foolproof, has been working two years and has proved its worth. One or two smaller devices have been effective, so that my experience of four or five years has been that mechanical contrivances, generally, are worth their cost and do decidedly increase the output.

But my experience has also been that it is best not to entrust such to the garden boy! As regards the mechanical cultivator for the garden, I have not by me, here abroad, the yearly analysis I keep of time devoted to garden and outside work (such as hay, paths, shrubberies), but I know that "digging" runs to a very high percentage of the garden time, and in our stern climate, where frost and snow do actually prevent digging for weeks together, it seems as if a mechanical digger, by taking advantage of favourable times, would get the "necessary" done more easily and more quickly, and thus release the staff for other work; in other words, would increase the output. I believe it best not to mention specific types, but I have so far only heard of two more or less suitable. One is too large and too expensive and is for the market gardener on a large scale. The other may be suitable, but I have not met a user. The other various types which must exist I cannot hear of. Of course, having been abroad all summer I have not been in a good position for inquiry; indeed, I had hoped that your columns would be the most effective means of obtaining information.

One last word. We do not hope to make our garden pay its whole way, for much time must be spent on wholly "unproductive" work, but we already go a good step towards it. A. D. G. G.
Switzerland.

Morphixia paniculata

This iridaceous plant is seldom met with, yet it is a beautiful and interesting ally of Sparaxis. About 1 foot in height, the long, narrow leaves provide a graceful foil to the slender flower-spike. The pretty pale buff flowers possess remarkably long tubes, and are charmingly arranged upon the scape. The variety alba is pure white and black centred, and rosea is coloured a delightful shade of apricot-pink, both being extremely desirable plants. Flowering April-June, these Morphixias require the same treatment as Ixias and Sparaxis. They are charming when grown in pots or pans for the cold greenhouse. Like the majority of South African bulbs, they require a well-defined period of rest, without which they cannot give of their best.

RALPH E. ARNOLD.
Cirencester, Glos.

A Random Commentary

FOR the last fortnight London has been —almost literally—a focus of heat waves, and tempers have been short, and criticism has tended to be a trifle captious. But on Monday night a cool wind set in from Scotland, and on Tuesday morning its mollifying effects were evident in Greycoat Street, when even these specialists who are inclined to regard the Dahlia as the worst mistake in horticulture since Adam ate the Apple, might have been heard to say that " Dahlias *will* be Dahlias " in a beautiful spirit of toleration.

Yet it is difficult to see what fault any gardener could find with the miniature Pæony-flowered Dahlias that were selected for trial at Chelsea. Darjeeling (of Messrs. Cheal) might very appropriately have been called Flame, if that name had not been so often used and misused, for its flamboyant petals of a peculiarly clear orange, shading down to yellow, looked almost alive and flickering. Schneider, shown by the same firm, may have been so named for purposes of publicity, but it called up an image congruous with its name in the lurid crimson of its ray florets, shaded almost to smoky black, and its hot yellow centre. The subject of names inclines one to ask why a bright pink Gladiolus was called Angel's Eyes; we are led to suppose that angels are white, but it seems unreasonable to conclude from this that they are albinos.

Down in the centre of the hall there was a reminder of a bygone fashion in a vast bed of scented Pelargoniums. This collection, which has been built up by the Hon. Vicary Gibbs and Mr. Beckett, is probably unique to-day in richness and variety, and some of us hope that it may stimulate an interest in these good old plants, whose flowers may be brilliant, bizarre, or inconspicuous, but are never quite dull (but, in fairness, it must be said that those who have been captivated by the Geranaciæ find it difficult to confess that any of them are quite dull or dowdy), and whose leaves always give out some odd scent or other the whole year through. The air round the exhibit was heavy with the soft scent of labdanum, which some of the species give off as freely as a Balsam Poplar in spring or Cistus creticus in a hot summer, but a discreet pinch here and there (for which the exhibitor is, apologetically, asked forgiveness) reveals scents which range from Rose, Lemon, Peppermint, and Hazel to Tansy and Tarragon.

Close to the Pelargoniums was another exhibit which recalled the past. It was a forest of fruit trees in pots, laden with Grapes, Apples, Figs, and purple Plums, and shown by the firm of Rivers and Sons. It struck one at first as just a high-water mark of horticultural skill, and then it suggested the opulent, leisured days of mid-Victorian gardening, when the rich spent their money in growing Peaches and Pineapples instead of running high-powered cars. Whether it is more commendable to eat your money or to burn it, I hesitate to say; but, if I were a millionaire I think that I would call on the traditional skill of Messrs. Rivers and eat my dinner under my own Vine and Fig tree in the winter garden. But, putting such fantasies on one side, such an exhibit shows what can be done (with skill) in a small space and suggests an admirable hobby whose triumphs any of one's friends would be pleased to share.

There was a very promising new-comer to the garden shown, where many good plants have made their debut, in Messrs. Perry's exhibit. This was Aster Frikartii, a hybrid raised on the Continent from Aster Thomsoni, from which it inherits an early-flowering habit and slightly greyish foliage. Its flowers are very large, about the size of the Michaelmas Daisy King George (but perhaps rather neater and more refined), and of a luminous clear lavender.

Among the " New and Noteworthy Plants " was a specimen of Clerodendron fœtidum, whose inclusion in this category serves to call attention to an excellent, but somewhat neglected, late-flowering shrub rather than startle us with novelty. It must have been named by a botanist who habitually looked on the worst side of things, for, though its leaves smell of over-roast beef and Elder, its flowers exhale the sweetness of Freesias.

I am sorry that I said in these notes that Perovskia atriplicifolia was the American Sage Brush. There is no excuse for such mistakes, even in a heat wave, and I am very grateful to Mr. Ingwersen, to whose genial erudition I have so often resorted, for his kindly correction. M.

Clerodendron fœtidum

An excellent late-flowering shrub that must have been named by a botanist who habitually looked on the worst side of things

Thalictrum dipterocarpum

There are some fascinating plants among the Thalictrums, or Meadow Rues, but none can, I consider, bear off the palm as superior in beauty to T. dipterocarpum. A most lovely plant, at times it is as much as 4 feet or 5 feet high, with rather sparsely-produced foliage for such a tall plant. It bears on sprays, branching out from the main stem a lavish abundance of rose-lilac flowers of the characteristic form of the race, and possesses creamy-yellow stamens, which add to the charms of the flowers. It is one of our finest border plants. The white variety, T. d. album, is exceedingly lovely, forming a fitting companion to the typical plant, and good specimens of either supply subjects which arouse the enthusiastic praise of all flower lovers. Unfortunately, T. dipterocarpum sometimes refuses to make itself at home in the garden. The strain of producing flowers and seeds appears to exhaust its energies, and its owner is left lamenting the loss of one of his favourite flowers. It is not easy to provide the fare and situation, of which Farrer speaks when he says (" English Rock Garden," page 391) :—" Th. dipterocarpum is
the most magnificent of all in the Ch
group, and to prosper as it wants sh

National Dahlia Society

A noteworthy exhibition

E Annual Exhibition of the National
ahlia Society took place on Wednesday,
eptember 11th, and for the first time
rranged in the New Hall of the Royal
cultural Society, Greycoat Place, West-
er, S.W. The executive were anxious
eir first show in the ample accommo-
afforded in the New Hall should be a
s, and they were not disappointed. The
displays were arranged against the
of this large building, and were suffi-
in number and extent to completely
the whole of the wall space. Viewed
the dais these trade groups made a
ful framework to the exhibition as a
and if only it had been possible to
owered some backgrounds to staging
for the show of the R.H.S. on the day
liately preceding, the floral picture
have been more complete and dis-
more satisfactory. The trade rose to
casion. They set up groups compris-
ge exhibition blooms as well as those
for garden embellishment, and almost
type of the Dahlia was represented in
rious groups. There were 14 or 15 of
striking displays from the trade, and
were of unfailing interest to visitors
the show remained open. Messrs.
and Co. well merited the large gold
they were awarded for their remark-
isplay of several of the better types of
ahlia. They were particularly strong
e miniature-flowered Pæony and
tte types, and set up these dainty
most effectively. Gold medals were also awarded to Mr. J. B. Riding and Mr. H. J. Jones. The former showed a wonderful lot of the large-flowered novelties, some of them of huge proportions, while the latter had a beautiful arrangement in which both new and established favourites were well represented. Messrs. Carter Page and Co., Mr. J. T. West, Messrs. J. Cheal and Sons, Ltd., Messrs. Jarman and Co., King's Acre Nurseries, Ltd., Mr. W. Yandell, The Dutch Dahlia Society, Messrs. J. G. Ballego and Sons, Leiden, Holland, and other well-known growers all showed well, each firm well maintaining the high position they have reached in association with the Dahlia. The Dutch growers put up some remarkably well grown flowers, and much surprise was generally expressed that the blooms were in such fresh condition. There was one new class to which special reference should be made. This was for 12 blooms, distinct, to represent the larger-flowered types of the Dahlia. There were no fewer than seven exhibits, huge blooms winning first prize for Mr. G. F. Drayson, a Buckhurst Hill, Essex, amateur, who covered himself with glory with his wonderful exhibit. The varieties shown were Marmion, Grace Curling, W. D. Cartwright, Trantonian, Sola Mio, Mabel Lawrence, Golden Fleece, Starlight, Mr. J. de Van Warner, Ellinor Vanderveer, Faith Garibaldi, and a monster bloom of Elite Glory—all outstanding.

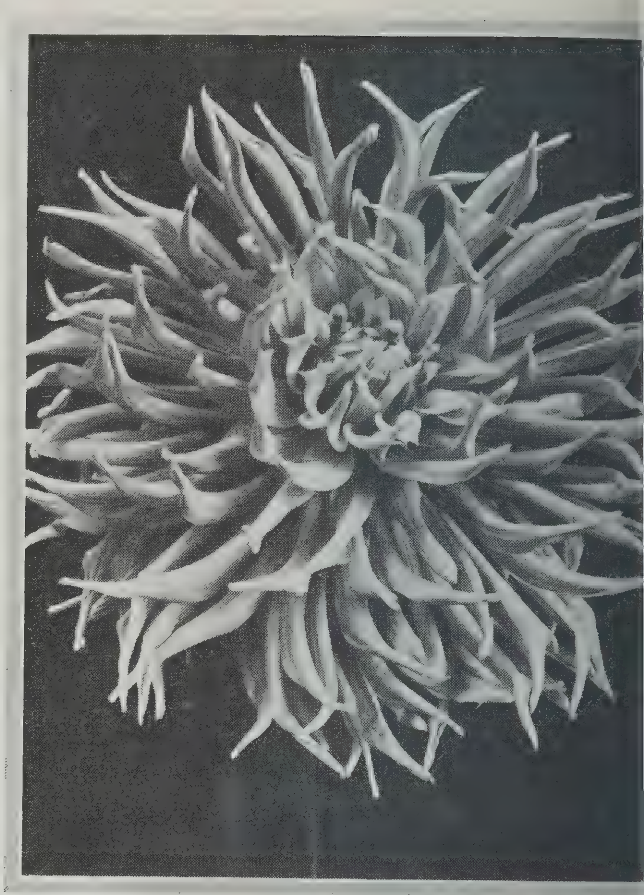
Another excellent competition was that for the Monro Challenge Cup for 12 vases, distinct varieties, any number of blooms, for market purposes. There were six or seven splendid lots, Mr. J. Emberson, Walthamstow, repeating his success of the year before by winning premier honours. His varieties were Cheal's Pink, Reginald Godfrey, Mrs. Linford, Jersey Beauty, President Wilson, Feodora, Crimson Flag, Lord Ullswater, Mr. H. C. Drusselhuys, Snowdrift (beautiful for groundwork for wreaths), Glut, and another. Mr. J. B. Riding was a most uncomfortable second. Pompon sorts were freely shown, more freely than usual. Competition was keen in the class for 12 varieties, six blooms of each variety. Mr. C. Luckin, of East Grinstead, was placed first with well proportioned blooms of Johnnie, Raider, Glow, Tommy Keith, Little Beeswing, Adelaide, Madeline, Little Marvel, Tommy Laing, Queen of Whites, Daisy, and Princess. A quite good standard of size was observed by the judges.

The chief competitive class for Cactus Dahlias was that for 12 varieties, distinct, six blooms of each variety. Owing to the extremely trying weather of late, these blooms were not up to the usual standard. First prize was awarded to Mr. H. Woolman, Shirley, Birmingham. He showed the following varieties:—Edgar Jackson, Patriot, Sydney Jones, Mary Purrier, Yellow Bird, Mammoth, Silverhill Park, Harry Strutt, Ballet Girl, Virginian, Thos. Want, and Mayflower. The foregoing was an open class.

The decorative classes were well contested. These classes provided representations of Star Dahlia, Mignon, and another class for any other Dahlias except Star and Mignon varieties. Mrs. Tisdall won first prize in the Star decorated table; Mrs.

New Cactus-flowered Dahlia Katherine Valentine Smith, bright cerise or pink, white centre, of perfect form

Shown by J. G. Ballego and Sons, Leiden, Holland. Selected for trial at Wisley



Golden Sun, a superb Cactus-flowered Dahlia, of war apricot hue and bright yellow centre. Flowers borne hi on erect stems

Courtney Page the table for any other Dahlias than Star and Mignon, showing the pretty little buff small-flowered Pæony variety named Tiny, raised by Mr. J. T. West. The writer was placed first out of five entrants for a sideboard decoration, using brilliantly coloured crimson and scarlet Dahlias with Asparagus plumosus and beautiful grasses as an embellishment.

It is not possible to refer to the many beautiful and noteworthy exhibits set up in this splendid show. There were as many as 66 classes, and in almost every instance the competition was quite good. The once popular globular blooms of the show and fancy types were represented, but, oh! so different to what the great florists of, say, 40 years ago used to do. Ample compensation for their loss is found in the many beautiful new types of the flower, all of which are so highly decorative, both in the home and garden. The show was opened by Lady Denman.

D. B. Crane.

New Dahlias

Novelties selected for trial at Wisley

Two meetings of the Royal Horticultural Society's and National Dahlia Society's Joint Committee took place on Tuesday and Wednesday, September 10th and 11th, respectively. On the first day there was an excellent display of novelties, but on the second day there were no fewer than 56 new varieties submitted to the adjudication of this Joint Committee. The under-mentioned sorts were selected for trial next year in the gardens of the Royal Horticultural Society at Wisley, Surrey.

September 10th.

The Ranee.—A promising miniature-flowered Pæony Dahlia, having fairly broad blunt-pointed florets building a flower about 3 inches across. Colour, scarlet, dark stems and foliage. Shown by Mr. A. J. Cobb, University Gardens, Reading.

Faygate Star.—A rather small-flowered star Dahlia. The flowers are about 2½ inches in diameter and are of good form, and are borne on erect stems. Colour, bright crimson-scarlet. Shown by Messrs. J. Cheal and Sons, Ltd., Crawley, Sussex.

Bhopal.—A useful miniature-flowered Pæony variety. The florets are broad and are evenly arranged, making a bloom 3 inches in diameter. Also shown by Messrs. J. Cheal and Sons.

Darjeeling.—Another interesting decorative flower of miniature Pæony form. Florets medium and pointed, building a bloom rather less than 4 inches across. Colour, brilliant scarlet with yellow centre. Shown by Messrs. Cheal.

Schneider.—A promising miniature-flowered Pæony with fairly broad florets, developing a flower from 3½ inches to 4 inches in diameter. Colour, rich, deep velvety crimson with a beautiful sheen. Shown by Messrs. Cheal.

Tunis.—A very small Pompon sort of good form, with shell-like florets. Colour, crimson and scarlet. Erect stems. Shown by Messrs. Cheal.

September 11th.

Jamboree.—A promising large-flowered decorative, having long, broad, blunt-pointed florets that develop a bloom about 8 inches across, of good, even form. Colour, rosy crimson. Shown by Messrs. J. Stredwick and Son, Silverhill Park, St. Leonards-on-Sea.

Laconia.—A very large, Cactus-lik corative, of good form, with long, pointed florets, building a massive-lo bloom. Colour, a pleasing soft pink. shown by Messrs. J. Stredwick and So

Avis Cowdrey.—Another large deco of good form and massive build, fully 8 in diameter. Florets very broad and po A really handsome white sort. Show Messrs. Stredwick.

Dora.—An attractive miniature-flo Pæony of good form. Florets broad f size of flower, about 3½ inches a rounded at the ends. Colour, centre crimson, passing to a crimson buff sha the ends of the florets. Shown by M E. Burrell and Co., Howe House Nurs Cambridge.

Glint.—See illustration. A distinct of miniature Pæony form. The floret fairly broad, slightly twisted, and pointed, building a charming flower of what novel form and about 4 inches a Colour, a distinct shade of scarlet. stem. Shown by Messrs. Burrell.

Senley.—Another pretty minia flowered Pæony. Florets broad and rou at the tip. Colour, rich velvety crimson. blooms are between 3½ inches and 4 i in diameter and are borne on erect, coloured stems. Shown by Messrs. Bu

Lurid.—Still another brilliant s miniature-flowered Pæony. Florets broad and rounded at the ends, build flower about 3½ inches across. Erect s Also shown by Messrs. Burrell.

Claret.—A welcome addition to the s flowered decorative section. Florets broad and rather pointed, building a f of good form about 4 inches across. Co he name denotes, claret. Shown by rs. Burrell.

u O. Bracht.—A large and attractive r of Cactus form. Some may regard new sort as a decorative. The florets are l and prettily twisted, building a beauti- refined flower nearly 9 inches across. ur, primrose. The blooms were ex- les of the highest culture. Shown by srs. J. G. Ballego and Son, Leiden, and.

therine Valentine Smith.—See illus- on. This is a Cactus Dahlia of ideal and character, the flowers, fully 7 es in diameter, being borne on stiff, erect s, and poised at an ideal angle. Long lar-like florets, prettily twisted. Colour, rich pink with white centre. Also shown by Messrs. J. G. Ballego and Son.

Mrs. A. E. Breuls.—This is a Cactus-like decorative Dahlia of medium size and beautiful form. Florets fairly broad, tapering off to a point. Its chief charm is its colour, and this may be described as bright cerise pink, paling off to the centre. Shown by Messrs. W. Topvoort, Ltd., Aalsmere, Holland.

Florence M. Davis.—Another large decorative, some 8 inches in diameter. Florets broad and blunt-pointed, long, erect stems, building a flower of good form. Colour, bronzy-orange. Shown by Messrs. W. Treseder, Ltd., The Nurseries, Cardiff.

D. B. Crane.

National Rose Society

HE New Hall of the Royal Horticultural Society at Greycoat Place, Westminster, S.W., proved how well suited to display the great autumn show of National Rose Society. Exhibitors were to set up their Roses in comfort, and rally accommodation was ample.

oking up the hall from the dais groups oses were arranged against the walls on eft and at the end of the building. On right further groups were displayed nst a high background, shutting out the on the right. These groups come from trade, and consisted of cut Roses nged in stands of various devices. These groups are always a source of much est to the Rose-loving public as they invariably display many old favourites and a host of new and choice varieties.

There were six exhibits in the leading class for groups of a representative character, each exhibit showing well. Messrs. McGredy and Son were in excellent form and condition, staging beautiful blooms of high quality. Included in their group was a grand lot of Mrs. Charles Lamplough, the beautiful soft lemon Hybrid Tea, one bloom of which (illustrated page 647) was selected as the best Rose in the nurserymen's classes. This firm was placed first in the premier class. Messrs. Chaplin and Sons were second and Mr. J. H. Pemberton third.

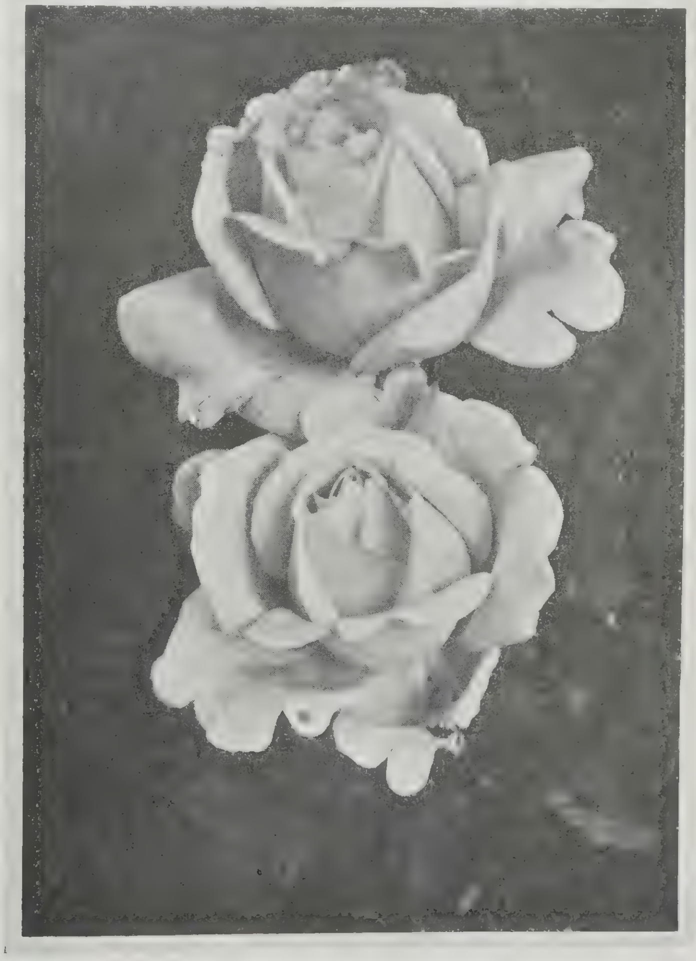
In the next class for a rather smaller representative group of Roses there were also six exhibits, Messrs. D. Prior and Son being first with a beautiful lot of Roses, Messrs. R. Harkness and Co. second, and Dowty's Nursery third, all showing exceptionally well. The five exhibits in the third class for a group of a representative cut Rose found Mr. John Mattock leading, followed by Messrs. A. Reeves and Co. and Mr. Henry Drew. These 17 trade groups were the great feature of the show.

It may be of interest to readers to mention just a few of the more popular Roses set up by the competitors in the above-mentioned three classes. They were the following varieties:—Dame Edith Helen, Los Angeles, Betty Uprichard, Mrs. A. R. Barraclough, Mrs. Samuel McGredy, Hortulanus Budde, McGredy's Ivory, Norman Lambert, Mme. Butterfly, Waltham Cross, Golden Emblem, W. E. Chaplin, K. of K., Mrs. Henry Bowles, Mrs. Henry Morse, Independence Day, Etoile de Hollande, Mabel Morse, Mons. E. Herriot, and the beautiful singles, Dainty Bess and L'Innocence. Dwarf Polyantha Roses, such as Kirsten Poulsen, Else Poulsen, Alice, Coral Cluster, and many others were frequently in evidence.

Much interest centred around the class for 24 distinct cut Roses. A series of blooms of beautiful quality and noteworthy colour, although somewhat overdressed, won first prize for Messrs. Thos. Smith and Sons, Stranraer. The advantages of a cooler and moister climate were here denoted. The better blooms in this prize-winning stand were Mme. Butterfly, Dame Edith Helen, George Dickson, Mabel Morse, Augustus Hartmann, Golden Emblem, Lady Inchiquin,

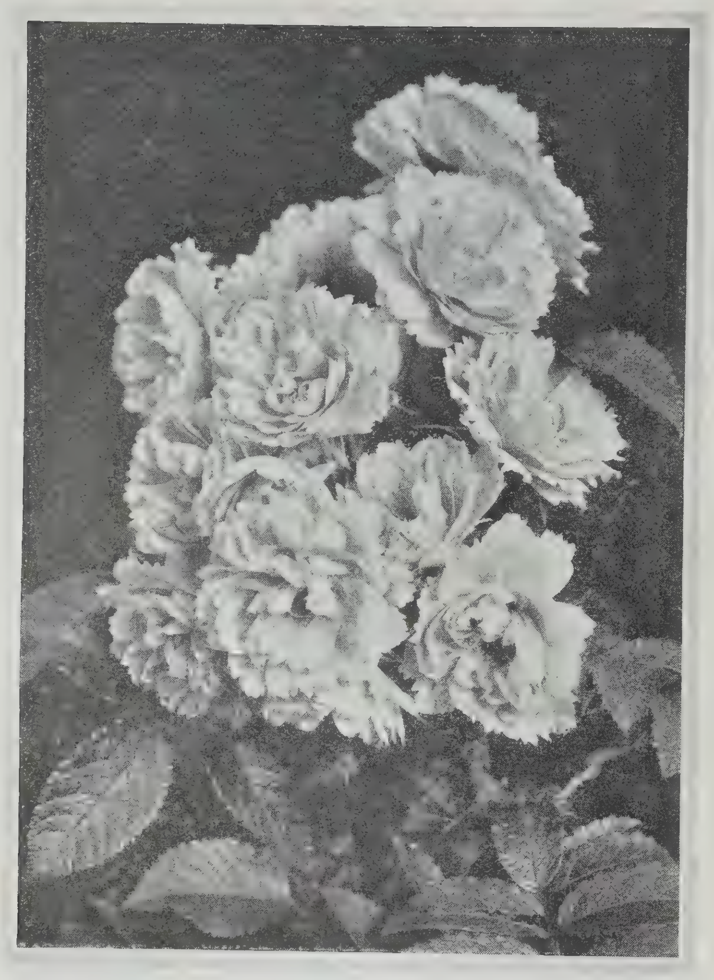
The Rose Show in the New R.H.S. Hall

The view from the dais looking down upon the decorated tables of Roses



Golden Dawn, a new cream-coloured H.T., of good size and substance, and very fragrant

Shown by D. Prior and Son. Certificate of Merit



Rose Pink Grootendorst

Clusters of fimbriated flowers like pink Carnations and the rough foliage of Rosa rugosa. A very free-flowering dwarf Rose, listed as a Polyantha but obviously of rugosa origin. Shown by George Prince, Oxford

A basket of Mrs. Sam McGredy, one of the outstanding Roses at the show

Flowers scarlet coppery orange, heavily flushed with red on th outside of the petals. The foliage is of dark bronzy green. It i a distinct and most beautiful novelty

Lord Allenby, Imperial Potentate, Mabel McGredy, and Lord Stair.

An interesting class was that for three baskets of Polyantha Roses. Messrs. D. Prior and Son, Ltd., showed well and won first prize with superb examples of Kirsten Poulsen and Else Poulsen and Alice Amos. Generally speaking, competition in both nurserymen and amateur classes was quite satisfactory, taking into consideration the extraordinary dryness of the current year.

There was a good array of new seedling Roses, but none of them gained the much-coveted distinction of a Gold Medal. Only three new varieties even succeeded in obtaining a Certificate of Merit. They were as follows :—

James Gibson.—A Hybrid Tea of beautiful form and good quality. The florets are of good substance and the colour may be described as rich velvety-crimson. It is described as free and bushy.

Golden Dawn (see illustration).—This is a promising autumn-flowering Hybrid Tea of good form and substance, very slightly scented. Colour, pale yellow, outer florets tinted rose. Vigorous grower.

D. T. Poulsen.—This new Rose is described as a dwarf Polyantha and is borne in attractive clusters of semi-double flowers. Colour, bright velvety-crimson. Described as robust and upright.

The decorative character of the Rose was amply illustrated in several competitions in which table decorations, bowls, and vases were attractively displayed. In the nurserymen's section there were five good table decorations, Mrs. C. Tisdall, South Woodford, winning first prize with a superbly arranged decoration in which the yellow variety, Roselandia, in the pink of condition, easily made it the best table decoration in the whole show. There were no fewer than six table decorations in the amateur section, the same variety again being seen in the first prize exhibit. The fourth prize exhibit in this latter section, in which grand blooms of Mme. Butterfly were most artistically arranged, was worthy of a much better position.

It would be a distinct relief if exhibitors would illustrate the charms of other varieties of Roses than those usually seen in these competitions. Mme. Butterfly and Roselandia are invariably represented time after time, and such Roses are usually the product of the market gardeners, grown under ideal conditions such as few amateurs could produce in their own gardens. It is rather misleading, however, to the general public, who can never hope to produce such Roses in their own gardens. It would be better were competitions provided where Roses, the product of the exhibitor's own garden, could be utilised to make the display. This might result in there being represented at these shows many Roses of a highly decorative character, such as are never seen in the table decorations of the N.R.S. to-day. The baskets and bowls were interesting, some being distinctly good. Generally speaking, however, they were much too large for use in the home, and surely this is what these classes are intended to illustrate.

Deutzia Veitchii

This is quite the best of the pink-flov Deutzias, being of deeper colour and la flowered than D. longifolia, and a shru moderate growth. It is a charming and able addition to the May-flowering decid shrubs. It is very beautiful when g against a wall, and is equally effective i shrub border, or as an isolated specimen, a grouping of several plants is wholly lightful. The corymbs of flowers are g fully disposed along the arching growth colour bright rose, with deeper shading. shrub grows well in a loam soil enriched leaf-mould and manure, and is, undoubt one of the most beautiful of the myriad introductions from China. It quite wor commemorates the great firm to whom owe so many garden treasures.

Ralph E. Arnol

Border Carnations

Wherever possible, the layers shoul planted in well prepared beds, but it is portant that such work be done early while the soil is still warm. The new la will then become firmly established in new soil before winter is upon them. If is not possible, or the land too wet du the winter, as, for instance, in low-lying tricts and on heavy clay soils, then it is m better to pot them up into 3-inch pots, wi in frames, and plant out at the beginnin April.

Eichornea crassipes (syn. E. speciosa)

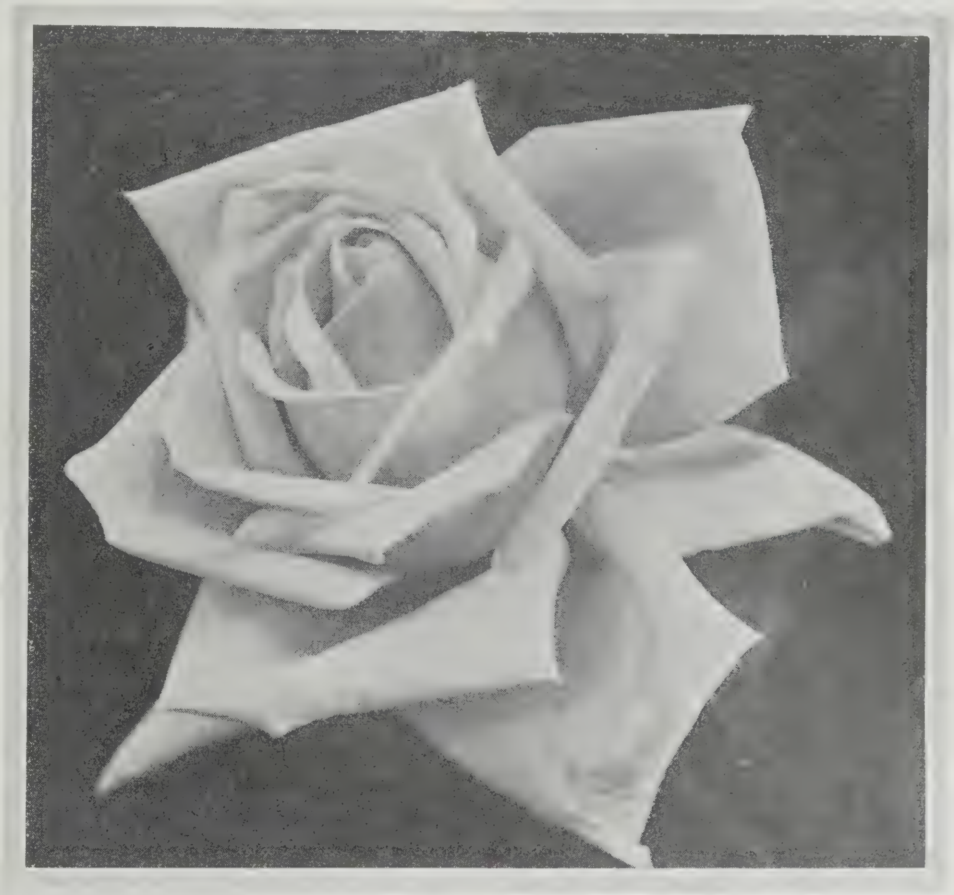
This charming and interesting stove aqua-
is a member of the Natural Order Ponte-
riaceæ. It is a native of South America
d tropical Africa, and the plant has also
en found growing in Queensland, where it
oves itself a veritable pest in some rivers
blocking them and rendering navigation
fficult. A prominent feature about E.
assipes is the curiously inflated leaf-stalks.
nese, no doubt, assist the plants very greatly
floating. The root system is two-fold. In
ep water it produces roots in abundance,
it these never reach the soil, and the plant
mains a free floating perennial. In shallow
ater anchoring roots appear about flowering
ne. The inflorescence is a loose spike
eraging six to eight blooms, and consisting
six segments. These are pale violet in
lour, the upper one having a dark blotch.
Because of its great similarity to a Hya-
nth, this plant has received the name
'ater Hyacinth. E. crassipes remains
flower rarely more than 24 hours. In dull
eather it may last just a few hours longer.
fter the flowering period has expired, the
alk begins to bend, and ultimately places
e flower below water. The plant never
oduces seed in this country. This is, per-
ips, because the insects which pay visits are
osent. The cultivation is comparatively
mple, providing one has the necessary
aterial at hand. A fairly rich compost
ould be given so that the roots may derive
me nourishment. The plants should be
commodated in a warm tank in the stove
other suitable house. E. crassipes repro-
ices itself very quickly by means of offsets,
that it must be restricted somewhat or
se it becomes crowded. F. H. Wright.

Antholyza paniculata

The tall spikes of brilliantly-coloured Mont-
etia-like flowers produced by this Cape bulb
late summer are very beautiful, and a
odly colony of the great sword-like leaves,
ith the orange-red flowers showing above
em, will create a garden picture of beauty
d distinction. Like the majority of South
rican plants, A. paniculata must have sun-
ine, and plenty of it, and so its ideal posi-
on is a border at the base of a south or
uth-west wall. A border at the base of a
eenhouse wall will provide a home for many
autiful bulbs from the South African
easure-land. A light, well-drained, and
erably rich soil should be provided, and in
e milder districts the bulbs may remain
disturbed for some years, with a handful
dry litter to ensure their safety in winter.
me authorities recommend an annual lift-
g so as to separate the small bulbs, replant-
g in October, November, or February, but
have experienced better results when the
lbs have remained undisturbed. In the
lder districts, an annual lifting is impera-
e or the bulbs may be planted in a cold
use. I recently saw a generous mass of
paniculata in fine form, and with it were
ch treasures as Gladiolus dracocephalus, a
eenish-yellow flower suffused and striped
ownish-red, thus imparting to it a snaky
pearance, the Lily of the Incas, Alstrœ-
eria pelegrina alba, and many fine
inums. It is a border of outstanding
auty and interest, and with many more fine
rden features worthily commemorates the
e Mr. H. J. Elwes who, at Colesborne,
thered together so many beautiful and rare
ants. The older Antholyza crocosmioides
a fine plant, but scarcely so bright or effec-
e as A. paniculata. The flowers of the
ter are, too, larger and more widely ex-
nded. Ralph E. Arnold.

Edinburgh Flower Show

THE Flower Show held in the Waverley Market, Edinburgh, and organised by the Royal Caledonian Horticultural Society, the oldest and parent Scottish society, was a great success. The entries constituted a record, and the organisation was taxed to its limit in the preparation which was not so well conducted as last year. Considering, however, that 24 hours before a market was held there, some lenience must be allowed to the officials who had to prepare for the finest and largest exhibition ever held in the market. If, as last year, this Autumn Show was the finest held in the kingdom, this year's display was still further a great advance on that of the year previous. Almost every section and class was of the highest standard of excellence. Though the Sweet Peas at Southport were considered by the experts to be the finest seen this season, those at Edinburgh were still finer. The standard of exhibits, trade and amateur, were of such high excellence that there was no single exhibit standing out as a leader above the others. All were of superb quality, whether it was Dobbie's Dahlias, with that new section of Orchid-flowered blooms of such alluring charm, the Roses, which were magnificent, the Begonias, a truly splendid lot, the herbaceous section, the Chrysanthemums, fruit (including Grapes), Carnations, or the vegetables, of which Austin and McAslan, of Glasgow, put up a grand display. Mention must be made of Phloxes, of which two exhibits particularly merit attention. One staged by Fairbairn and Sons, of Carlisle, contained new novelties, including Joan Fairbairn (rose), Border Gem (purple), Lady Lynch Blosse (pink and white), and The King (parma). There were some notable rockwork exhibits. Maxwell and Beale showed a new light rose-coloured Heath of great merit; the form, though totally different to the type, was of remarkable beauty. Open and bushy, spread out, horizontal, near to the ground, with one or two strong central shoots standing up perpendicularly, their bases surrounded by rayed sub-shoots like the spokes of a wheel, and the centre straight up, clothed nearly half way up with a mass of light rose blossoms. These, with the rayed laterals at the base and all the horizontal shoots, were smothered in blossom of the purest colour. This plant is destined to capture all who see it and become very popular. The fruit, unlike last year, was well coloured, above normal size, and in the pink of condition. Apples, Pears, Plums, and bush fruit were grand. Among Plum novelties, Gage Baskerville, a seedling of Washington Gage, was given a provisional Award of Merit pending further details. The decorated tables of fruit, and particularly the Grapes, are deservedly famous at Edinburgh. This year they were of tip-top standard; both Mr. Anderson's and Mr. McInnes' bunches of Muscat of Alexandria were practically faultless, and there was a slight tinting of rose on some of the berries, a most unusual occurrence for Scotland. There was a record gate, and more county and society people attended, consequently the trade did more business than in former years. This is a remarkable achievement considering that Glasgow, Aberdeen, and Dundee Shows attract the purchasing public, and that the



A magnificent bloom of Mrs. Charles Lamplough, awarded the Silver Gilt Medal for the best bloom shown by a nurseryman

Shown by S. McGredy and Son

Agapanthus with over 40 heads of bloom

first mentioned was held the week before. The Society must be congratulated, but there is room for improvement in organisation. It is a mistake to have gramophones playing when a splendid band is in attendance, and domestic china and pottery have their right places in shops. C. A. J.

Polygala chamæbuxus purpurea

This is a sturdy and dwarf little evergreen plant which may be grown well on fully exposed spots on the rock garden in deep, sandy peat. It grows in very dense, rounded tufts, the little stems, ascending to a height of 6 inches to 9 inches, are erect and clothed with small, bright shining green leaves. The flowers are a bright magenta-purple with a yellow centre. In spring it produces a plentiful crop of flowers, and indeed with me it is in bloom more or less the whole year round. It is difficult to increase by cuttings, these being slow in growth, and where plants exist a good plan is to work some sandy material into the tufts in autumn. Before doing so, some of the shoots should be half severed, and then work in some more soil. Many of the growths thus treated will root by the spring and quickly make plants. Cuttings made in the ordinary way are by no means certain and make plants slowly. The plant may be divided in July, but will never out-grow its position. H. Stevens.

Wasps

Some wide-mouthed bottles filled with a solution of sugar and water, with enough yeast to make it ferment, will draw all the wasps from the fruit if hung up in its vicinity. G. G. Baker-Cresswell.

Agapanthus and Belladonna Lilies

I AM sending two photographs of flowers in my garden in Cornwall that I think may interest your readers. The Agapanthus was a magnificent sight, having over 40 heads of bloom. This particular plant was first placed in an ordinary border on which I eventually built a dry wall, the result of which you see in the photograph. The second photograph is one of Belladonna Lilies in a dry, hot border.

L. Heriz-Smith.
Carsilgy, Ruan Minor, Cornwall.

Uncommon deciduous trees and shrubs

THERE are many beautiful deciduous trees and shrubs that are seldom seen except in large parks and private gardens, and yet many of them may be quite as successfully grown in the amateurs' smaller gardens. As an example, there is Köelreuteria paniculata, which is extremely useful and suitable for small gardens, as it is quite a tree in habit and yet seldom exceeds 12 feet in height. It forms a clean stem and somewhat irregular head, clothed with pretty pinnate leaves. The long spikes of yellow blossoms are produced in June and July. It grows well in any ordinary soil, but prefers a sunny position, where it can be readily increased from seeds or by cuttings of the roots taken in late autumn, inserted in sandy soil, and kept close in a cold frame. There is also Symphoricarpus racemosus, which is known as the Snowberry. It is a bush from 4 feet to 6 feet in height, which grows well in sandy soil and is suitable for shady spots. The berries, which are pure white, resemble small marbles, and are freely produced where favourably grown. They remain on the shrubs throughout the autumn and the greater part of winter. S. vulgaris, a smaller shrub than the former, bears pink flowers and white berries, which, however, are not so large and showy as those of S. racemosus. There is a variety of vulgaris which is very pretty, as the leaves are edged with yellow.

Exochorda grandiflora, known as the Pearl Bush, forms a graceful specimen 6 feet to 8 feet in height. The blooms, which are white, are very beautiful during the latter part of April and May. It is a useful shrub for clothing old walls, and may be associated with Ceanothus or others that bloom later. The best way to increase this shrub i layering some of the straggling sh which, however, take about two years to sufficiently for removal.

Desmodium penduliflorum throws slender, wand-like shoots from the base height of 6 feet or so, is clothed with tri ate leaves, and during September they terminated by large clustered masses of dish-purple blossoms, which are very att tive when few other shrubs are in blo The tree is easily increased by division, grows well in soil where most shrubs thr

Tamarix gallica, which is a very attrac loose-growing shrub, bears spikes of pr pink blossoms which are freely borne du the latter part of summer. Its great v lies in the fact that it will flourish even c to the sea, and especially along the So Coast, where it is largely used for " hedg and screens. It must be in a fairly moist when planted inland. There are sev kinds, but there is very little difference tween them, and they all root readily w cuttings are put in during autumn in open ground.

Cratægus Crus-galli, commonly called Cockspur Thorn, is distinguished from others by its huge conspicuous spines, wh render the name of Cockspur a particul appropriate one. The flowers are large somewhat late, while the berries are a d red. The leaves die off brightly coloured.

Another interesting tree is Cratæ tanacetifolia, which obtains its na from the fact that its leaves are dee cut and hoary and in many ways resem the Tansy. It is valuable for its late flow which are, as a rule, the latest of the Tho to bloom. The flowers are white, agai which the blackish anthers stand out c spicuously on close examination. The berr are greenish-yellow when ripe.

Colutea arborescens, known as the Blad Senna, is remarkable for its large, curiou inflated seed pods. It is a loose growi bush, 10 feet to 12 feet high, clothed w bright green pinnate leaves, and bears yell Pea-shaped flowers, succeeded by the curi pods already noted which are tinged w red. It grows readily in poor, stony, or soil. There are several other varieties, this I consider the best.

Rhus Cotinus is a beautiful shrub, chie noteworthy for its curiously formed florescens. Sometimes called Smoke Wig Plant. The flowers are borne on a mu

Belladonna Lilies in a dry, hot border

anched panicle, which also produces a umber of thread-like filaments clothed with ne hairs. These are sufficiently numerous envelop the greater part of the plant in asses of pinky wool-like substance during e latter part of July and August. There is so a variety named atropurpurea, which ars panicles of a purple hue. The leaves rn yellow in autumn before falling.

Hippophea rhamnoides, which is com-only known as the Sea Buckthorn owing its adaptability of growing well by the sea-le, succeeds equally as well inland. It akes a bush 6 feet to 8 feet in height, and is Willow-like leaves of a silvery whiteness nderneath. The berries, which are crowded und the shoots for nearly a foot, are about e size of Peas and of a bright orange tint. uring the latter part of autumn and in nter this is one of our brightest shrubs. ke the Aucubas, the male and female flowers e borne on separate plants, so to ensure e production of berries both sexes must be presented, one male to half-a-dozen females ing sufficient. It is a splendid shrub for anting near water, as it enjoys a cool root n.

Salisburia adiantifolia, the Maiden Hair Tree, is sometimes known under the name of Ginkgo biloba. It is a native of China and a very distinct tree. The trunk is usually straight, and the branches have an upward tendency. The minor shoots droop somewhat. The leaves are in shape like the pinnules of the Maidenhair Fern. The foliage changes from a delightful Pea-green colour to yellow in autumn, when it is most attractive. It does best in a vegetable soil or retentive loam.

Then there is Calycanthus floridus, the American Allspice, which is a compact shrub seldom growing more than 6 feet in height, and clothed with dark green, ovate leaves. The flowers, which are borne early in June, are about 2 inches across, of a peculiar lurid purple colour and pleasantly scented.

Finally there is prunifolia flore-pleno, a beautiful Spiræa, which has long, arching shoots which at the end of March and during April are smothered with clusters of small pure white double blossoms. In this stage it is very beautiful and attractive. It sometimes reaches the height of 6 feet. It prefers a deep, moisture retaining soil.

W. E. Wright.

Notes from a Cornish Garden

HE last of the Rhododendrons are now in flower: R. discolor the earliest, white and scented, from China; then Ungernii m the Caucasus, blush, and indestruct-y hardy; and lastly auriculatum, large and ite, with big leaves having an auriculate se. The old plant here was bought at ombe Wood, and is now some 11 feet high d 15 feet across. It is in partial shade and thriving, but unfortunately has never yet seed, and I hardly expect it to do so this ar, though by request I have put the pollen R. maximum on it from the extreme limit elevation of that species in the hope of tting a large-flowered hybrid hardy enough the colder parts of U.S.A.

Among the high Alpines, Rhododendron uenense is beginning again at the upper d of the Primula bank. This bank is be-ning interesting as the home of many ifs and strays, for my family are interested wild flowers and occasionally send back bring varieties and expect me to grow m. Sisyrinchium angustifolium, the e-eyed grass of Galway, is in bloom there, d Saxifraga stellaris, which my son sent m Skye, together with S. oppositifolia, ich arrived in bloom, and is now quite py.

His other finds which seem at home in-de Aspidium lonchitis, the Holly Fern, lenium viride, and the Parsley Fern, yptogramme crispa. Polypodium phego-ris, the Beech Fern, is also thriving, and t we found on Brown Willy, the highest rnish hill, on one of the wettest and most pleasant days I can remember, whilst the k Fern, Polypodium dryopteris, came up steriously in one of my Rhododendron s and has only recently been planted out. Three bits of Asplenium viride and stopteris fragilis, the Brittle Bladder Fern, apparently satisfied with the corner of a sonry wall facing north, near the stable d. The last was sent by a friend from a ll of limestone near Garve, in Ross-shire, from its present appearance promises to permanent. Not yet have we found a isfactory place for the Filmy Ferns, menophyllum unilatere and tunbridgense, though we have collected plants locally had them from Skye, the situation chosen never yet met their approval.

nother wildflower on the Primula bank Alchemilla alpina. This, from Cumbrae, been in residence for eighteen months, is fairly established, and has flowered well this year. Two of the Club Mosses, Lycopodium selago and alpinum, also from Cumbrae, are likewise happy so far, and the pale green points to their shoots suggest that they are pleased with their new home, but I notice that the slugs have been attacking these new shoots, and this may affect the result.

Lilium sp. Farrer 316 has sent up a 5-foot spike with eight of its great white trumpets, with their green interior, and in the same border against the house, facing S.E. and shaded from all except the morning sun, Tropæolum speciosum is coming up everywhere and flowering at intervals. Against the same wall Mutisia ilicifolia is blooming freely for the first time, and M. retusa is growing well, but has not yet reached the flowering stage.

In 1927 I mentioned the Tropæolum and the difficulty of establishing it. This elicited a letter from some kindly unknown friend, and this is what he says: "The roots were put into pots of leaf-mould and stone on November 27th, 1924, and the pots were plunged to the rim in leaf-mould under a north wall in the open. On April 8th the shoots were appearing. On April 28th the plants were turned out of the pots to the north side of an old Quince tree, care being taken not to break the balls of soil, leaf-mould, peat, and sand being put round. In this place the Tropæolum seems to be now quite at home. The branches of the Quince come down to the ground, and the Tropæolum runs up them, and is at present in bloom in several places in the tree."

These are his ipsissima verba, and I thought that readers of "Gardening Illustrated" would be grateful for the information contained in them.

Whilst I am on the subject of cultivation, here are some more hints which may prove useful. My kind friend, Mr. Joseph B. Gable, junior, of Stewartstown, Pa., U.S.A., sent me some seed of Epigæa repens and described how it grows in its native habitat thus: "I send it by reason of the interest in an article, which stated that it was difficult to grow in Britain. From this article it would seem that its cultivation is generally attempted in shade with you. I am familiar with this plant and have found it in many places, and in almost every situation and condition, but by far the best and most healthy looking stations are on barren hills that slope to the north and north-west. On such a slope on my property here thousands of plants grow naturally and flower profusely each year, and although an adjacent wood is full of it, there are a hundred flowers—maybe five hundred—in this old barren field to each flower in the wood. From March to September the sun shines down full on them all day long. Drought affects them not at all. You may have the equivalent of our drought in England, but I doubt if you have any equal of our intense sunshine. I have found it in full sun on south slopes, on a level hill-top in Georgian sun, and encrusting the slopes of wind-swept dunes. In short, if of course you are interested, I suggest trying Epigæa repens in full sun in Britain on barren, rocky, acid soil, where your Heather likes to grow, for from what I remember of the English and continental climate during the late war, I do not think your sunshine would ever hurt it."

"And that," said John, "is that." And may we yet hope to see fields of this charming plant in this country, thanks to Mr. Gable's information. Talking of conundrums of the sort, has anyone yet solved the problem of Ranunculus Lyallii? If someone would write from New Zealand and give such clear details as the above, it is possible that its needs might be met. A correspondent threatened to send me seed, but to my regret has failed to do so, though I hope and believe that he is growing my Rhododendron seed successfully.

"Peter the Hermit."

Storage of Potatoes

The time is at hand when gardeners will be giving consideration to the lifting of the Potato crop. Experience has taught me that it is one thing to grow a crop well, and another to store it well. So far as the storage of Potatoes is concerned, the great enemy to be feared is an outbreak of the disease known as Winter Rot. This is invariably caused by the development of acid conditions in the storage quarters. The causal organism is then given an opportunity to develop, of which it makes the most use. Some years ago I tried various specifics on a well-controlled experimental scale for the purpose of finding out which was most effective in neutralising acidity. The honours went to flowers of sulphur, which were sprinkled amongst the Potatoes as they were put into store at the rate of ½ lb. per ½ ton of tubers. In addition to being a natural corrective of acidity, flowers of sulphur are fungicidal, and to these properties combined I attributed the immunity from Winter Rot. Since then I have always used this substance, and I have no hesitation in recommending it as being effective.

G. H. C.

Proposal for International Peace Garden

If the proposal advanced at the recent Annual Convention of the International Association of Gardeners is accepted, a 400-acre international peace garden at some point on the boundary between Canada and the United States will be established. The delegates at the Convention considered the best memorial to mark the peaceful relations which have existed between the two countries for more than a century would be a spacious flower garden. The exact location of the garden is to be discussed at a future meeting. It is proposed that 200 acres shall be in United States territory and 200 acres in Canadian.

A suggestion to raise a fund of $5,000,000 for the project was advanced, the money to be raised by inviting adults in Canada and the United States to contribute 25 cents each and children 5 cents.

REMINDERS FOR THE WEEK

Southern and Midland

Spring Cabbage

The land having been liberally manured and allowed to settle down to a certain degree of firmness, it should now be planted, using the best plants from the earliest sowings and planting them at 16 inches apart all ways. This being the earliest spring vegetable for use from the open, it is important that planting should be carefully done, the base of the roots being made very firm, and not merely round the collar, as Cabbage likes firm ground. A few plants of a red variety, such as Early Red Drumhead, should be put out at the same time, as, in addition to their popularity as pickle, these are excellent when cooked in the ordinary way. Allow for a further planting later from the smaller plants sown for this purpose.

Cauliflowers

These are now plentiful, but as frosts must be expected at any time, it will be found advisable to break a few of the leaves down over their heads as a protection. A sowing of Walcheren and Magnum Bonum made at the present time will, if a cold frame can be placed over them, winter safely and provide excellent plants for growing under glass early in the new year, either with or without heat.

Endive

Protect those growing in the open if frost threatens and proceed with the blanching of well-grown specimens, for with the decline of good Lettuce these will be in greater demand. Almost anything will do for blanching which will exclude light and keep the plants dry, such as inverted pots, slates, or air-tight boxes.

Mushrooms

Where the necessary material is available it should be got together and turned frequently, a dry shed being necessary for this purpose. When ready, beds should be made up from 18 inches to 2 feet in depth and well firmed. When the temperature of the beds has receded to about 80 degrees, the spawn must be inserted and an inch of fine, new, sifted loam placed over the surface, flattened, and made tolerably firm.

Rose cuttings

Some varieties do remarkably well from cuttings, which may be prepared by all. Choose well ripened shoots about 9 inches in length which have bloomed this season, removing them from the plants, especially Teas, H.T.'s, and H.P.'s, with a heel attached. Cut away the old flower-heads and all the leaves, and plant firmly in shallow trenches, along the bottom of which has been placed 1½ inches of sharp sand. It is most important that the base of the cuttings should be made very firm. When completed, 5 inches or 6 inches of the cutting should stand clear of the soil. One good watering is usually sufficient. These will make nice plants by the end of July next year, from which time they will provide a quantity of beautiful fresh blooms.

Rearranging Glasshouses, Vineries, and Peach houses

These are often used during the late summer for stove and greenhouse plants in order to relieve congestion in those houses which for a time are required for the accommodation of tuberous-rooted plants such as Caladiums, Achimenes, and Tuberoses. Most of these are now ripening off and may be placed in cooler quarters, and in order that space may become available for the great mass of pot-grown plants which have been grown in the open, it will be necessary to re-arrange the former in their original houses. Ferns, Palms, and Dracænas benefit considerably for this temporary change, but must return without delay.

Bedding plants

Continue to take cuttings of these until the required number is safely rooted. It may be advisable, in the case of very unusual specimens, to lift and pot up and place in safety should frost threaten. This applies to those of a soft-wooded nature, which are easily disfigured.

Vineries

In Vineries where late Muscats and other varieties are only partially coloured, a little fire heat will be found necessary from this date, owing to the declining power of the sun. Light is also important in the case of the former, and a drier atmosphere than of late must be the order.

Hardy fruits

Hardy fruits, such as Apples and Pears, growing on walls frequently suffer from lack of moisture when the fruit is undergoing its final swelling. It is, therefore, most desirable that such trees should be occasionally soaked, and those carrying heavy crops assisted with applications of liquid manure. Pears are of fine quality and abundant, the early kinds being gathered slightly in advance of their actual ripening in order that their fine flavour may be preserved.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The Melon house

In the majority of cases Melons are over for the year, so as soon as possible after the last fruit is cut have the house or pit thoroughly cleaned before moving in the winter occupants, for the Melon almost invariably leaves a legacy of vermin which, unless drastic measures be taken, are certain to infest the newcomers. Remove all movable rubbish, therefore, wash down all glass and woodwork and limewash brickwork, all of which causes a deal of trouble, but is an absolute necessity if clean, healthy plants are to be looked for.

Ripe Grapes

As the days shorten and the outdoor conditions become damper and damper, the difficulty of keeping ripe Grapes in good condition increases greatly. Very frequent examination of the bunches is imperative, any decaying berry being removed immediately it is noticed, and so preventing further loss by contamination. A little warmth in the pipes, with abundant ventilation, is probably the best treatment.

Ripening-off Tomatoes

It very frequently happens that the houses occupied during the summer months with Tomatoes are required for late-flowering Chrysanthemums, so, as the housing of these will have to be faced very shortly, it is advisable now to get the houses in readiness to receive these at short notice, sharp frosts being liable to put in an appearance at any time. To encourage the remaining Tomatoes to ripen off quickly, allow a little warmth in the pipes and not quite so much air, while water should only be given to prevent flagging. Such treatment may not improve the quality of the fruits, but it will certainly hasten the ripening.

Prick Cauliflowers into frames

If seeds were sown in the open last mo the seedlings should now be in good condi for pricking into beds of light soil unde cold frame. Make the soil nice and firm allow 3 inches between the plants. W well, close the frame for several days, shade from all sunshine. After the plants have recovered from the shift, be to admit a little air and increase the volu of this gradually, for coddling is the w treatment to extend to these plants.

Lifting Potatoes

Just as soon as a variety is ripe have it up and stored in a cool, dark place. Bef storing, remove all small, diseased, and d aged tubers. The best-shaped, medium-si specimens should be selected for planting the spring. These keep best, and produce finest crops, if well " greened " in the before being stored in a light, cool place, q safe from frost.

Plant Daffodils in Grass

This is by far the best position for Daffodil, not only because it looks m natural when so planted than when in garden, but because the blooms are kept from mud splashes, which so often disfig them when wet weather comes. Many of varieties thrive well and have a very beaut effect when planted thinly under large ciduous trees.

Plant Spanish Irises

These gorgeous and graceful bulb flowers are so cheap that quite a num should be planted in every garden. Ab the present time is quite well suited for planting of the bulbs. Moderately ri rather lightish soil seems to suit them b They do quite well planted in rows 12 inc apart and the bulbs 6 inches asunder in rows. Plant 3 inches to 4 inches deep.

Attend well to the Dahlias

As these are so easily damaged by wi it is advisable to look over the plants at q frequent intervals, tying securely, yet loos to the supports. Remove spent flowers a thin the shoots if likely to become ov crowded. Should the soil threaten to beco dry at the roots of the plants, give a go soaking of clean water.

Border Chrysanthemums

These are flowering well this season, a it will be a pity if frost comes early and stroys all this brightness. If at all possib some method should be adopted whereby pa of the plants at least could be saved, stu stakes being driven in at intervals and loop with strong tar twine in such a way as support mats or something of the kind, su protection being usually sufficient to ward all but really sharp attacks.

Plant May-flowering Tulips

If the ground is available, there is reason why these very beautiful and use subjects may not now be planted. For cu ting in succession we find the following ve suitable :—William Copeland, Inglescom Pink, Clara Butt, Bronze Queen, Ingle combe Yellow, and Mme. Krelage. The are, of course, many others equally good.

Keep an eye on the Nerines

As soon as the point of the flower-stem a pears, give a little water so as gradually moisten the soil. If there is any difficulty managing this, plunge each pot for a fe minutes in a bucket of water, and so be ce tain that the whole mass has been effectivel moistened.

C. BLAIR

Preston House Gardens, Linlithgow.

cænas Veitchii and australis from seed

HERE are but few ornamental foliaged
reenhouse plants so useful for decora-
ive purposes as these green-leaved,
-like Dracænas. They have the merit
of being easily grown and of keeping in
condition for a long time when used for
ing-room decorations. It does not ap-
to be generally known how easily and
ly they may be raised from seed, yet
s by far the best method of propaga-
Plants raised in this way make vigor-
healthy growth and quickly attain a
l size. When in a young condition the
ng plants assume a style of growth
distinct from those raised from suckers,
aves in the former case being narrow
pright in habit. In this stage they are
nely effective for dinner-table embellish-
or for arranging in bowls and vases,
hich purposes small plants are in great
nd. As the plants increase in size the

China Asters in front of the Temple of Bellona at Kew

come broader and gradually develop
drooping habit of growth. It may thus
n that by sowing seeds every year,
n giving great diversity in their form
wth may be obtained from these two
es of Dracænas.

m seed sown in January last good plants
w available in thumb pots. These will
be shifted into 3-inch pots, then by
g them in pits kept rather close and
with a little artificial heat turned on
n October, the plants will be of a use-
from November onwards. September
uitable month during which to make
ng, as with good treatment the plants
ng therefrom will be available for use
e next. To hasten germination the
should be soaked in warm water for
rs before sowing. Even then it is
ntly a month or six weeks before any
f growth is apparent, and I have no
that should the seed be rather old,
ation would not take place under three
s. I mention this to prevent dis-
tment, because sometimes seeds of this
are set down as worthless and the soil
in which they were sown consigned to the rubbish heap, when the real fault lays in the impatience of the would-be cultivator. Loam and leaf-soil or peat in equal parts, with abundance of sharp sand and a little finely broken charcoal added, the whole being passed through the ½-inch sieve, forms a suitable compost for sowing in, and one that will not easily become sour—a matter of great importance when preparing soil for seeds which germinate slowly. I sow in well-drained boxes or pans covered with a square of glass, and place where there is a brisk bottom heat at command. It is a good plan to dibble the seeds in an inch apart. The seedlings may be allowed to make good progress before being placed in pots, for they do not like being disturbed till their roots have become active. In the first potting, a compost similar to that in which the seeds were sown answers well, and for subsequent ones two parts loam to one of leaf-soil or peat, with soot, charcoal, and sand added, the whole being well mixed, will be found to give satisfactory results. As the plants increase in size and need larger pots the compost should, of course, be used in a rough state.

H. D.

Clematis orientalis tangutica

Not at all a showy Clematis, there is yet something extremely fascinating about this free-growing species. The small, golden yellow flowers are produced August-September, and are charmingly disposed along the arching growths. Some peep intriguingly from the truss of foliage, and the result is a pleasing picture, and one of distinction and interest. I recently saw this Clematis growing upon a low fence as a background to a border of choice hardy plants. Its next-door neighbour was Adlumia cirrhosa, a little-known plant bearing a close resemblance in foliage and flower to Corydalis, and a charmingly light and graceful climbing plant it is. This dainty plant and the Clematis created a fair picture and a delightful setting for the many choice plants flowering in the narrow border. There is, I believe, a neat-habited and distinct variety of C. o. tangutica known as C. o. t. obtususcula; it is very pretty as a pot plant and has been in evidence at recent exhibitions. These Clematis are quite easily grown and are usually hardy, especially the type plant.

Fifty Years Ago

Poisoning from Yew berries

CHILDREN are very apt to pick and swallow the attractive berries of the Yew. The practice is a most dangerous one and ought to be carefully kept in check, as is shown by the case of a little boy on whose body an inquest has been held at Oxford. The child, according to the "Daily Telegraph," had been strolling through a cemetery with his friends, and while playing about he had plucked and eaten "a handful of Yewberries." No evil effect was noticeable until next morning, when he awoke in convulsions and died before even a doctor could be fetched. The poison seems to have attacked the nerve centres, but in what specific manner it is not easy to say. Every poison is a possible remedial medicament, and therefore the Yewberry may have valuable uses. Like many other vegetable poisons, it does not seem to be made the subject of careful experiment, so that no antidote to it is known. Yet why should not toxicologists make a study of this and of several other common and baneful growths? Deaths are constantly occurring amongst children who pick and swallow these things and science might do something to protect them against the fatal effects of their ignorance.—*November 22nd, 1879.*

Warner's King Apple

This is becoming a favourite with market growers, and certainly it is a very useful fruit. Solid, firm-fleshed Apples fetch a higher price in the market than light, hollow-centred sorts, most Apples being now sold by weight. Such sorts as Lord Suffield and Cellini, planted largely a few years back, are already being discarded. Amongst early kinds, the old Keswick is about the most prolific and largely grown, as when gathered as early as possible it is a sort that amply repays good cultivation. But Warner's King is one of the Apples of the future for main crops.—J. G.—*November 1st, 1879.*

In answer to a Correspondent.

Jacob Plum

We know of no such Plum as this. The name is probably a local one and is not to be found in lists or in the "Fruit Manual," which gives, as far as possible, all the names by which certain kinds of fruit are known. If a good Damson is wanted, the best is the Crittenden of Farleigh Prolific, a very early and remarkable bearer, fruit a little larger than that of the old Damson, and ripe at the end of September.—A. D.—*October 4th, 1879.*

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FRUIT

Diseased Pears

(B. P. Standen).—Your Pears are affected with Pear Scab, due to the fungus Venturia pirina. Please see replies *re* Pear Scab on pages 587 and 603 in our issues for August 24th and 31st respectively. If you examine the undersides of the foliage you will find the fungus present as dark, sooty, green patches. The leaflet on Apple and Pear Scab, published by the Ministry of Agriculture, 10, Whitehall Place, S.W. 1, would be useful to you. You can obtain a single copy post free by writing to the Secretary at the address given above.

Nectarine and Peach specimens

I send three packets of leaves from my greenhouse which have been attacked by a pest of some sort, and I would be very much obliged if you will examine them and let me know what is the matter. No. 1 are from a Nectarine tree whose leaves have gone like this for two years running; the fruit does not appear to be affected. We have found Red Spider on the leaf and treated it with Volck, but do not know if this discoloration of the leaf is entirely due to Red Spider. No. 2 are from a Nectarine tree from another part of the greenhouse, and I would like to know if it is the same pest that has attacked No. 1. No. 3 are from a Peach tree in the same greenhouse and are evidently affected by something quite different. I would be very much obliged if you will give me advice as to how to treat these trees.

"SOUTH WALES."

[The appearance of the specimen labelled No. 1 is entirely due to the attack of Red Spider. We find that many of the mites have been killed, but several applications of Volck will be necessary before you can hope to control such a bad attack. Please see reply to "Bert" on page 617 of our issue for September 7th. If your trees had been given the syringing they should have had, Red Spider would never have made such headway. The specimens No. 2 are merely a repetition of No. 1. As to whether or no the infection came from No. 1 we cannot say, but it is likely. Again, lack of syringing allowed the pest to spread. The Peach leaves labelled No. 3 have been attacked by one of the Weevils, probably the Black Vine Weevil. At this time of the year this creature is in the maggot stage, feeding upon the roots of many garden plants. Early next spring the maggots pupate in the soil and the adults emerge shortly after. The adults feed upon the foliage of many plants, eating the leaves around the edges, causing the curious serrated leaves such as you send. This Weevil feeds at night, hence it is frequently overlooked. A dressing of flake naphthalene should be applied to all parts of the Peach house border so soon as the house is empty at the rate of 2 ozs. per square yard. Fork the material in as deeply as possible without actually disturbing the roots. This dressing might be repeated before the house is started next spring. Any Weevils which survive this treatment, and there may be quite a number, may be trapped by placing a band of hay around the stem of the tree close to the ground level. Examine the band each morning and destroy the Weevils collected. Watch for the eaten foliage next year, and as soon as it is detected put down a white cloth during the day and then go to the trees at night with a light and give them a good shake. Some of the Weevils will fall on the cloth, and you will then know exactly what to look for in your trap. There will be very few adult Weevils at this time of the year—most of them die off after egg laying.]

Vine Mildew

(S. Walsh).—Please see reply *re* Vine Mildew on page 616 of our issue for September 7th. You will obtain control of the mildew if you use a sulphur vaporiser from time to time, not waiting, of course, for the mildew to put in an appearance, but to commence operations from the time the vines are started. Great care must be used when carrying out the operation, and the instructions accompanying the vaporiser must be carefully carried out. Other plants should be removed from the vinery during the operation unless it is known that the foliage of such plants will stand the treatment.

Peaches in a vinery

("Peaches").—You will never grow Peaches and Nectarines successfully in a vinery, the treatment necessary for the wellbeing of these being entirely different in many respects from that required by the Grape vine.

Planting Figs

I wish to plant three Fig trees. I am told that they should each be planted in concrete in a sort of large concrete "tub" made in the ground, as this prevents the roots spreading and greatly augments the fruiting of the tree. Could you kindly tell me what sort of dimensions the concrete "tub" should be that holds each tree? F. L. MARTEN.

[For each Fig tree the concrete "tub" should be 3 feet deep, 3 feet wide, and 4 feet long. The bottom, of course, must not be cemented, as free drainage is necessary. After making the "tub," therefore, place in the bottom coarse gravel or broken bricks and old mortar rubble to a depth of 1 foot, and on this lay fresh turves, grass side down, and then fill up with chopped turf mixed with mortar rubbish and broken bricks, the whole being well trodden down.]

CHRYSANTHEMUMS

Large Japanese Chrysanthemums

(C. M. H.).—We hardly understand what you mean by "the leaves twisting at the point of growth," but there is nothing uncommon about buds not developing if you have permitted growth to continue. That is to say, if you have not "taken the buds," as it is only terminal buds that, speaking
generally, develop without assistanc
may be, of course, that earwigs h
tacked the points, even one small p
by these destructive creatures maki
point of a Chrysanthemum plant usel
buds never developing, and the growth
plant itself interrupted. If you coul

Cltivating the exhibition Viola

THIS has long been a very popular flower t Scottish flower shows, and of recent ears large numbers of growers south of order have become fascinated with it. erous societies now include separate es for it at their annual shows, while al Pansy and Viola associations have formed to help to popularise this humble f plant. It can, of course, be easily l from seed, but as it never breeds true exhibitor has little use for seedling plants. n the middle of August until the middle ptember is the ideal time for the securf the cuttings, although quite good re- are had even a fortnight later. The cuttings, and indeed the only ones worth dering, are the sturdy young shoots that g from the centres of the old plants. e should be about 3 inches long. Cut gh just under a joint (pair of leaves), off the two lower pairs of leaves, and the ng is ready for planting in a bed of fresh, compost made under a cold frame. epare the bed, mix together three parts loam, two parts leaf-mould, and two clean, sharp sand. All should be passed gh a half-inch riddle and should iter be very wet nor very dry, but just in working condition. Make moderately n and level, and as soon as the cuttings eady dibble them in firmly, about 3 s apart each way. Give a good waterrough a rosed can, shut the frame, and e it thus for several weeks, shading carel from all sunshine. By the middle of ber a little air should be admitted by g the sash about an inch or so at the this chink being gradually increased nches or 6 inches. During the absence st this amount of air space should be ained day and night, while the shading d be gradually discontinued as the cut- get used to these conditions. As a rule nore watering will be required until h, but should the soil get on the dry a still, mild day should be selected on the sashes can be drawn back and a soaking of soft water given to moisten hole of the soil. When frost threatens, s the sashes. In the event of the cold being prolonged, lay a mat or two over lass. When the thaw comes do not e the mats for a day or two so as to t of the soil getting soft before expose cuttings to the light and air.

lch, of course, depends on the nature weather, but usually by the middle of ary the cuttings (now really rooted) begin gradually to wake up, and so e days the sashes should be pulled right while on wet days they should be tilted back in order that the water may be from the occupants of the frame and low a good amount of fresh air to circumong the plants. If the weather be and frost absent it is more than likely he soil will be getting dry, in which a really liberal watering will be desirnd should be repeated as often as the egins to show signs of getting dry. ff all flower-buds as they appear. At me very early planting (as early as the e of March) was the common practice, owadays mid-April is more favoured, rs have discovered that the cold winds ly spring gave a serious check to the plants, while slugs levied a heavy To give the plants a real chance, allow o inches to 12 inches between the plants way. Plant firmly, and immediately small stake, about 18 inches long, to plant and tie the stem securely, but , thereto. Plants, unless of a very habit of growth, should be restricted e stem and all flower-buds removed until a week or two before the date of the show.

The important operation of preparing the beds should begin in the late autumn. A fair dressing of well-rotted farmyard manure should be given and the whole bed, or beds, double-dug, throwing up the surface as rough as possible to permit of the elements sweetening, and pulverising it to a considerable depth. In February, should the ground be in a fairly dry state, a dusting of soot and lime should be given to the whole of the ground, and then the entire surface lightly forked over. Should the soil be of a very heavy nature, 2 inches or 3 inches of leaf-mould spread over the surface in March and forked in will give the plants every chance to make a strong and early start.

About mid-April (a little earlier in the south) the plants are set out as already detailed, and if the weather proves dry an occasional watering will prove very beneficial. By the first week in May the plants on light, dry soils will be greatly benefited by having a fairly generous mulch of very rotten manure spread all over the surface between the plants. This, besides helping to feed the plants, is of even greater value for keeping the roots cool and moist. It should, perhaps, have been stated earlier that while the Viola does fairly well in a sunny position if the soil is cool and inclined to be damp, it will thrive much better where it can have partial shade—not under trees, however.

Most experienced exhibitors have special pet fertilisers which they swear by, but the use of strong chemical stimulants must be condemned unless in the hands of an expert. Clear soot water is very good and very safe, as also is weak liquid manure made with sheep or cattle droppings. Always incline to weak solutions and apply these frequently in preference to a strong dose at long intervals. Where really large blooms are wanted, side-shoots must be removed while still in a small state, and so must flower-buds until within a few weeks of the show. As no one can gauge the weather for any length of time in advance, it is impossible to say just when the removal of buds should be stopped. To ensure having a number of flowers from which to select, it is necessary to grow several plants of each variety—not less than three—while the number of varieties must be considerably in excess of the number it is intended to stage. It is only by attending the various shows and studying the winning exhibits that one can hope to get to understand just what is required in the way of varieties and the method in which they should be shown. C. BLAIR.

Hibiscus syriacus

Undoubtedly one of the most beautiful of the large-flowered autumn-blooming shrubs, this old favourite is deserving of cultivation if only for the reason that it blooms at a season when most shrubs have passed out of flower. A deciduous shrub, with more or less erect-growing branches, it does, nevertheless, assume a bushy habit. The leaves are variable in size, and range from about 2 inches to 4 inches in length, ovate in outline, three-lobed, and coarsely toothed. Its large flowers are produced singly on short stalks from the leaf-axils towards the end of the branch. In favourable situations it attains a height of 8 feet to 10 feet. Although perfectly hardy in most parts of Britain, owing to its rather late flowering, it is often necessary to give it the protection of a wall, or grow it in a sheltered position, especially in the more exposed and late parts of the country, in order that its flowers may develop under the most favourable conditions. The type has bluish-purple flowers with crimson centres, but there are numerous forms in which the colour is exceedingly variable, including white, red, blue, purple, and striped. There are also forms with double or semi-double flowers.

According to Mr. Bean in "Trees and Shrubs Hardy in the British Isles," he says: "The date of the introduction of this shrub to Britain is not known, but it was included by Gerard among the garden shrubs of his time. It has been cultivated here for more than 310 years. In early times it was known as the Syrian Ketmie, and in the specific name Linnæus suggested that it was from Syria, but it has never been found truly wild except in India and China. In Syria, as in the more western countries, it exists as a cultivated plant only."

When planting is contemplated, a well-drained site should be selected, which is not too dry. It will thrive in any ordinary good soil of moderate quality in a sunny position. In the more favoured localities, for example, in the south, it makes an effective subject for hedges. It requires little attention as regards pruning, but if this becomes necessary owing to the plants out-growing their positions, they may be pruned back in April.

The following selection of varieties is considered to be a representative few of approved merit; this includes both single and double-flowered kinds:—Admiral Dewey (double), pure white; Boule de Feu (double), red; Cœleste (single), purplish-blue; grandiflorus superbus (single), rose; La Reine (single), rose; Monstrosus (single), white, with dark purple centre; pulcherrimus (double), pink and white; puniceus (double), red; Rubis (single), ruby; Totus albus (single), pure white. This shrub is occasionally listed under the name of Althœa frutex. J. L.

Omphalodes Luciliæ

Where this plant thrives it is one of the most exquisite of all Alpines, yet one always more or less difficult to keep, and still more difficult to increase to any extent. Slugs are particularly fond of its leaves, and will quickly clear off every vestige of growth. Usually under cultivation the plant will succeed in a mixture of peat and loam, with an addition of finely broken brick and some sand. In the rock garden a deep crevice filled with this soil would also suit it. Where the plant exists a few seeds may be saved each year, and though the seedlings present some variation of foliage, the greyish tint at times being absent, the flowers are much the same. The plant should never be disturbed in autumn or winter, but in April or May for careful division.

SHORT REPLY

Aldershot.—Green sulphur may be obtained from Messrs. Willis Bros., Harpenden, Herts, the price being about 1s. per lb. Yes, Violas may be planted if you deeply dig the ground and work a good dressing of lime and leaf-mould into the soil.

CATALOGUES RECEIVED

Kroone and Van Der Eng, Hillegom, Holland.—Comprehensive catalogue of bulbs grown on their own farms.

G. Beckwith and Son, The Nurseries, Hoddesdon, Herts.—Roses and Carnations.

Samuel McGredy and Son, Royal Nurseries, Portadown, N. Ireland.—Roses, fruits, bulbs, trees, shrubs, herbaceous and other plants.

Wm. Watson and Sons, Ltd., Killiney Nurseries, Killiney, Co. Dublin.—Roses.

Toogood and Sons, Ltd., Southampton.—Bulbs for winter and spring flowering.

LATE REPLIES

White Fly

(W. E. S.).—The small white insects are, doubtless, the destructive " snow flies," and these are most difficult to get rid of. Ordinary vaporising has but little effect on this little pest, while the various special preparations sold for the sole purpose of destroying it, while fairly effective, are somewhat dangerous to use, because they destroy, or at least damage, some kinds of plants. Chrysanthemums, Cinerarias, Salvias, Dahlias, and a few others must never be subjected to these fumes, whereas Tomatoes, Pelargoniums, Primulas, Cyclamens, and many others receive no damage whatever.

Fuchsias in cool greenhouse

(Helen Enderby).—In October you should gradually withhold water and the leaves will soon drop. During winter no water should be given if the plant is set in a cool, dry, but frost-proof place. In spring the plant should be lightly pruned and returned to the greenhouse. Syringe overhead daily, but give little or no water until growth begins to show, when the soil should be moistened, and as growth advances more water will be required.

Rust on Chrysanthemums

(L. T.).—Your Chrysanthemums are attacked by what is known as " Rust." It, as you have noticed, affects certain varieties, others being apparently immune. You should remove the badly marked leaves and burn them, while the plants affected should then be sprayed with diluted Bordeaux Mixture.

Omphalodes Luciliæ leaves disfigured

(Firbeck).—The leaves are attacked by fungus, to check which the plants should be sprayed with weak Bordeaux Mixture every 10 days until it is stamped out. If you experience any difficulty in obtaining Bordeaux Mixture dust the plants when moist with yellow sulphur, care being taken to see that the sulphur reaches all parts of the plant. We are interested to hear that this capricious plant grows well with you.

Gladioli failing; Pyrus and Plum for names

(Betty Sibley).—Your Gladioli are suffering from impoverishment and also from streak disease. There is no cure for the latter, and we advise you to lift and destroy them. Allow the remainder to ripen off, following which lift them, cut away the growth, and remove the old corm, which will be found at the base of the corm made this year. The best of the latter should then be stored for the winter in a cool, frost-proof room and planted out on well-prepared ground at the end of March. These Gladioli are so cheap that it is really more profitable to procure fresh corms each year. The Crab is probably Pyrus malus floribunda, but flowers are necessary to verify this. We do not think its fruits are suitable for jelly. The Plum was smashed to a pulp. It may be the true Bullace, which is wild in your district and is a very good edible fruit.

Lilium Harrisii

This flowered well in June, and it has now (September) put out three strong shoots well budded. Is this unusual, as before the same Lilies have only flowered once a year?

H. H.

[Bulbs of Lilium longiflorum Harrisii and other varieties of this Lily will occasionally throw second flowers in early autumn. Providing bulbs are of good size and in healthy condition, and grown cool, it is possible to arrange for a second crop of flowers by cutting the stems close to the surface immediately the first flowers open. It cannot be looked upon as a reliable method of
ing flowers for autumn, but quite a
will respond to this treatment. Prev
the practice of retarding bulbs of the t
Lily for autumn effect, flowers are o
by cutting down stems as soon as b
peared. This caused dormant side cro
push their growth, which more ofte
not terminated in good heads of bl
September and October. We do not
this is possible in the case of bulbs
have been forced.]

American Roses in English Gardens

does not always happen that plants ich do well in one country do equally ll in another, though the climatic differ- may not be great, but most of the ican Roses which have been imported England have been very successful. are not many of them; in a list of 150 best varieties grown in English gar- at the present time only 19 are of ican origin. But all of these are good, superlatively good.

earliest of the o cross the tic was Dorothy ns, introduced by on and Perkins or. It was one ne first of the uraianas, and by eauty and pro- of its rose-pink ers and the uriance of its h it created a tion. Though it een followed by others, it still its own, and are few English ns in which it is rown. One well- wn grower tly says in his gue, "Fault: niversally d." In shel- positions it is t evergreen.

Groombridge Place, Sussex: The moat and front entrance

The bridge takes the place of the old drawbridge. The house was designed by Wren, and some of the trees were planted by Evelyn

next American ortation, an y fine one in a nt way, was al McArthur, a d Tea raised by Hill Company in The flower with advantage little longer, ike most reds, it blues after a time, but arried on a stout stalk and is deliciously d. Forming a strong and even bush, owering throughout the season, General thur is the best bedder in existence. In vn garden there is a bed of 30 of the , which have been there for 14 years re still as vigorous and as floriferous as In the same year the same Company ver another charming red (light crim- Hybrid Tea, Richmond. It is a popular n Rose, but perhaps better under glass n the open air. It is largely grown as plant. The flowers are hardly of ex- on size, but excellent for vases or buttonholes. They are delightfully perfumed.

In 1909 the fine climbing Polyantha, American Pillar, came from Conrad and Jones. During its season, which is, unfortunately, rather short, it is a magnificent sight, its glossy foliage almost hidden by the huge trusses of single rose flowers with pink centres. It is already nearly as ubiquitous as the older Dorothy Perkins. It was followed the next year by the beautiful pink climber raised by Dr. van Fleet and named after himself. It is usually described as a hybrid Wichuraiana, and it has the vigorous growth, the glossy foliage, and the numerous flowers of a Wichuraiana, but in their size and fragrance it more nearly resembles a Hybrid Tea, which was evidently one of its parents. It is a fine climber.

A welcome addition to the Hybrid Teas was the rich pink Mrs. C. E. Russell, raised by A. Montgomery in 1913. It bears such large flowers that it could not be expected to have many, but they stand up well and are very sweet-scented. The war years were naturally a lean time for Rose growers. Only one American variety was imported into England, the Hybrid Tea Hoosier Beauty, raised by Dormer and Son in 1915. Its dark crimson colour is very attractive. It is fragrant and well shaped, but as it is a weak grower it is better under glass than in the open ground. Los Angeles came from Howard and Smith in 1918. Pink and yellow in colour, fragrant and perfect in shape, it was rich in promise, but in English gardens it dies back badly, so, in spite of its great merits, it must be classed among the Roses which are difficult to manage, especially as it is very susceptible to Black Spot.

The close of the second decade of the century brought many more novelties from America. Pride of place must be given to the salmon-coloured Hybrid Tea, Mme. Butterfly, which at the present time is the most popular bush Rose in English gardens. It was obtained in 1920 by the Hill Company as a "sport" from the English Ophelia, which it much resembles, though the colour is deeper, especially in autumn. With fragrant flowers beautiful in shape as well as in colour, carried on strong stalks, and with firm petals which withstand rain and wind, it is a perfect garden Rose, and seems likely to retain for many years its position at the head of the list. In 1926 the Boston Rose Company introduced a climbing Mme. Butterfly, which should become as great a favourite as the bush form. W. F. Dreer, another Hybrid Tea, cream with salmon centre, arrived the same year from Howard and Smith. It has been described as an improved Mme. Melanie Soupert. It is a pity that it was not differently named, as it might be confused with another Rose of the same name, a Wichuraiana brought out by Hoopes and Thomas in 1903.

The following year brought two more Hybrid Teas, both strongly perfumed—Hadley from Montgomery and Co., and Columbia from the Hill Company. The former has most of the good qualities of General McArthur, and is preferred by some gardeners for bedding. The colour is deeper and the shape is rather better. Columbia is a charming rose-pink, and as it has a similar habit to Mme. Butterfly it is already a general favourite. In a damp climate varieties which are not quickly spoiled by rain have a decided advantage over others that are.

Only two more American Roses remain to be mentioned, both of them raised by Dr. van Fleet, both of them described as hybrid Wichuraianas, yet with flowers as large as many Hybrid Teas—Mary Wallace (1924) and Heart of Gold (1926). The former is rose-pink shaded salmon, and the latter a beautiful crimson with white centre and golden anthers. They are still too new to be common in English gardens. H. C. D.

The herbaceous borders

These have lost their brightness, and quite a number of flower heads may with advantage—both to the plants and to the appearance of the beds—be removed. The borders should then be given a final cleaning and hoeing, and any extra staking required among late flowering Michaelmas Daisies should be attended to at the same time in order that the borders may be kept interesting as long as possible.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Flavour in Gooseberries

In answer to " W. B.," who wrote lately about Gooseberries of good flavour, if he will grow Langley Gage he will not be disappointed. It is an early kind, not large, greenish-yellow, of the highest quality and flavour. Another excellent Gooseberry of rich, brisk flavour is Red Champagne. Both of these can be confidently recommended. His praise of Lancer as a large, rather late, smooth green of good quality is well deserved. G. J.

Fifty years ago

You may be interested to learn that your paper has afforded help and instruction since its first issue, as my mother, who was a keen gardener, subscribed to the first number, and a copy has been taken in weekly practically ever since by one or other of the family. I am very interested by the "Jubilee" facsimiles of the woodcuts and extracts published from week to week, as these call to my memory some of the first impressions I had of the hobby of gardening, and were enshrined in three cloth volumes bound up in green. W. J. O.

Whitgarth, Cunningham Hill,
St. Albans.

What is wrong with the modern Rose?

What is the matter with the modern Rose? The position is a serious one for the would-be Rose grower and quite as much so for the producer.

Fifty years ago the Rose went on from year to year. Granted it was a flat rosette and was only required to bloom for two or three months at the outside.

Twenty years ago the Hybrid Tea also went on from year to year.

Nowadays where are the Roses of two years ago—even of last year? On the rubbish-heap and their names vanished from the catalogues.

What is one to think when one buys six plants of a kind, five die, the sixth flourishes, all have the same soil, the same culture? One hears only too often nowadays, Oh! we can't grow Roses.

Far too many Roses are rushed on the market. It would pay growers much better to place a few sorts well tried out in their own nurseries than the spindly, sickly specimens they now send out. In taking notes for the garden I now say, If I see this Rose shown again in three years' time I'll order it, otherwise it is waste of money to try new sorts. M. I. BUXTON.

[We have considerable sympathy with our correspondent, but can hardly see how the matter is to be mended, the craze for change having invaded the realm of flowers as much as it has other spheres of human activities. We hardly agree, however, that all Roses sent out are of so ephemeral a character. Many present-day varieties were raised years ago and are still offered in every Rose catalogue. What about Hugh Dickson, Caroline Testout, Mme. Melanie Soupert, Mrs. Henry Morse, Pharisaer, General McArthur, Frances Gaunt, Ophelia, Mrs. David McKee, Mrs. Wemyss Quinn, and many others? All these are really good Roses, fit for any garden, while such lovely, later-raised sorts as Lady Roundway, Lady Pirrie, Golden Gleam, Lady Inchiquin, Mme. Butterfly, Covent Garden, Mrs. Henry Bowles, Wm. F. Dreer, Una Wallace, Betty Uprichard, etc., give every promise of having "come to stay." One reason why so many Roses die annually is due to unsuitable stocks on which they have been worked. That is, the particular stock may not be suited to the soil of certain gardens and yet may produce excellent results in others. As an example of what a suitable stock can do we know of a bed of Caroline Testout planted over 25 years ago and which is annually a treat for several months. We do not know what the stock is. In the same garden Mme. Abel Chatenay simply refuses to grow.—ED.]

Gardens in Ancient Greece

I should be very interested to hear what is Mr. Edge's authority for the statement (issue August 24th, page 580) that the Greeks of classical times cultivated gardens to any extent, and also where the lines, translated from Chaeremon—the Greek tragedian, presumably—appear.

I had always had the impression that the Greeks, suffering, like all city-dwellers, from the evils of overcrowding, had little space for horticulture, and consequently no doubt showed little taste for it. There is, of course, ample evidence of their love of flowers, but it would seem rather to have been a love of wild flowers or of flowers for decoration or the making of garlands.

Of gardens such as the wealthier Romans made, I cannot recollect any mention, except in Longus, who was many centuries later. There is, too, I imagine, still a good deal of uncertainty as to the botanical nomenclature of Greek literature. The Greeks of classical times knew little or nothing of botany, and plants of the same species are given quite distinct names. There is, for instance, good ground for believing that the Greek Hyacinth was in reality the beautiful little Iris alata that appears in the first days of spring all over the regions surrounding the Mediterranean. The Rhododendron of the Greeks was much more probably the Oleander, and even their Violets and their Lilies are under suspicion of being something different from what we mean by them.

It would be of great interest to have the latest authoritative views on the subject. I should like to believe that the Greeks, who were capable of doing whatever they set their hands to as well at least as we can, were a nation who loved flowers and made gardens, and, if so, must at least have done it better than their descendants. I should also like to believe that all the lovers' garlands which they twined were something more graceful and artistic than the weird tangles they must have been if we are to take the tiresome old bore, Athenæus, as a speaker of the truth.

But I own I am a little sceptical. If the Greeks really had a passion for gardening, if they had, as every true gardener has, a love of growing flowers—as opposed to wearing them round their necks or putting them into buttonholes—someone or other, Xenophon or Aristophanes, would surely have mentioned it.

I own my classics are not what they were, but I do not now recall a single passage. R. E. S. Spender.

Bagley Wood, Oxford.

Perennial Aster King George, a low-growing variety of the Amellus section

The source of great attraction to Painted Ladies, Red Admirals, and other butterflies

Omphalodes Luciliæ

I am interested in your notes on the beautiful and difficult Omphalodes Luciliæ (issue September 21st, pages 653 and 654). I lay no claim to knowledge about Alpine plants, but happen to grow this one successfully in, perhaps, a peculiar way. I have it blooming well on date of writing (September 21st), and it has been in bloom all the summer.

I grow it on a heap of limestone chips with no soil at all and practically in full shade. The stone chips are kept watered and, when growing, I give it, every now and then, a watering with weak liquid-manure. I have always understood it is a lime lover. Slugs will not go over the stone chips. C. B.

Near Farnham.

Old-fashioned flowers

As an old reader of Gardening Illustrated and a very keen amateur gardener all my life in a very small way, I am distressed to note how many of the old-fashioned and most beautiful flowers seem practically to be extinct, notably, double Primroses, in mauve, white, and grey; Sweet - scented Rockets. Are these last Hesperis matronalis? Once I had 15 double Primroses and Polyanthuses, now I have only 10 varieties, and very few of most of them. "Old double Rose" or " Rose du Barri " does well here, and I have a good stock of it. It sells at what I consider a prohibitive price. I have a large collection of Primulas, but they are not in the same rank as double Primroses.

Netta Lendrum.

Corkil, Kilskeery,
Co. Tyrone, Ireland.

The Baneberries

Actæa spicata and its varieties are plants well adapted for moist and half-shaded situations in the wild garden, where their plentiful fruits will in autumn create a pleasing feature. They are plants of vigorous growth, some 3 feet high, with attractive foliage not unlike that of many Umbellifers. A. spicata, the common Baneberry, is generally distributed throughout the Northern Hemisphere and is plentiful in North America. It has also been recorded from one or two stations in Northern England. The terminal raceme of whitish flowers is followed by a plentitude of nearly black fruits. Most attractive varieties are A. spicata fructo-rubra, with bright red berries, and A. spicata fructo-alba, with dense spikes of large milk-white fruits. The last-named plant I recently saw in some quantity and in fine form, and thought it decidedly attractive, being of good compact habit, with nice foliage and a fine cr showy fruits. I would not admit these berries into a border of choice plants, as are somewhat obtrusive, but they are fine subjects for the wild garden, thin land where a moist soil exists, or for g ing in the stream garden. A. spica known as Herb Christopher, and there other species, A. racemosa—the Bugba Snakeroot—in cultivation. An added a tion to the white-fruited form is th stalks to the berries, and this little b colouring invests the plant with a pleasing distinction. Ralph E. Arno

Michaelmas Daisies

THIS is proving an excellent yea Michaelmas Daisies, and is showing again the value of these plants in th baceous border. I have a good collecti my garden, and I thought it would be ful if I were to communicate the nam a few of the best of these to our rea Ethel Ballard is a most profuse blo whose pyramidal growth attains a heig 5 feet to 6 feet. The flowers are of a l shell-pink hue. One of the finest Mic mas Daisies in cultivation is seen in variety King George. The flowers ar large size and perfect form, while the c is a beautiful violet blue. As this Mic mas Daisy only attains a height of 3 fe is excellent for small gardens. Though variety Chastity has been grown for s years, it is one of the best whites in cul tion. It attains the convenient height feet. The Hon. Edith Gibbs is, in my j ment, one of our best lilac-coloured v ties, and the habit of growth is all that c be desired. There is something of an world effect about the pale blue flower the variety Simplicity, and in the f coloured blooms of Coombe Fishacre t is represented the very essence of refinem The three last-named varieties grow height of 4 feet. I find that where Mich mas Daisies are concerned, thorough w ing of the soil and liberal enrichment manure are the leading cultural factors. is an advantage to do the work of plan during early November to give the roo chance of establishing themselves, triennial transplanting should be pract for the purpose of maintaining constituti vigour. G. H.

A few well-known Delphiniu

Few plants give more charm to the ga than Delphiniums, and the following s tion of choice varieties may prove usefu the would-be grower :—

D. Nudicaule, a gem from a colour p of view, and most useful because of thi the rock garden or for a group in the bor

D. Cardinale, another fine kind w flowers later and is taller. Many years I grew both, raising them from seed, an sowing every other year always had n vigorous plants. The seed was sown e in the year in pots, pricked out in boxe pots, and the next spring planted out. obtain the best results the plants nee sheltered spot.

D. Grandiflora.—The dwarf form, kn as the double Siberian, is a lovely deep b In a sheltered position it seldom attai more than 18 inches to 20 inches in heig

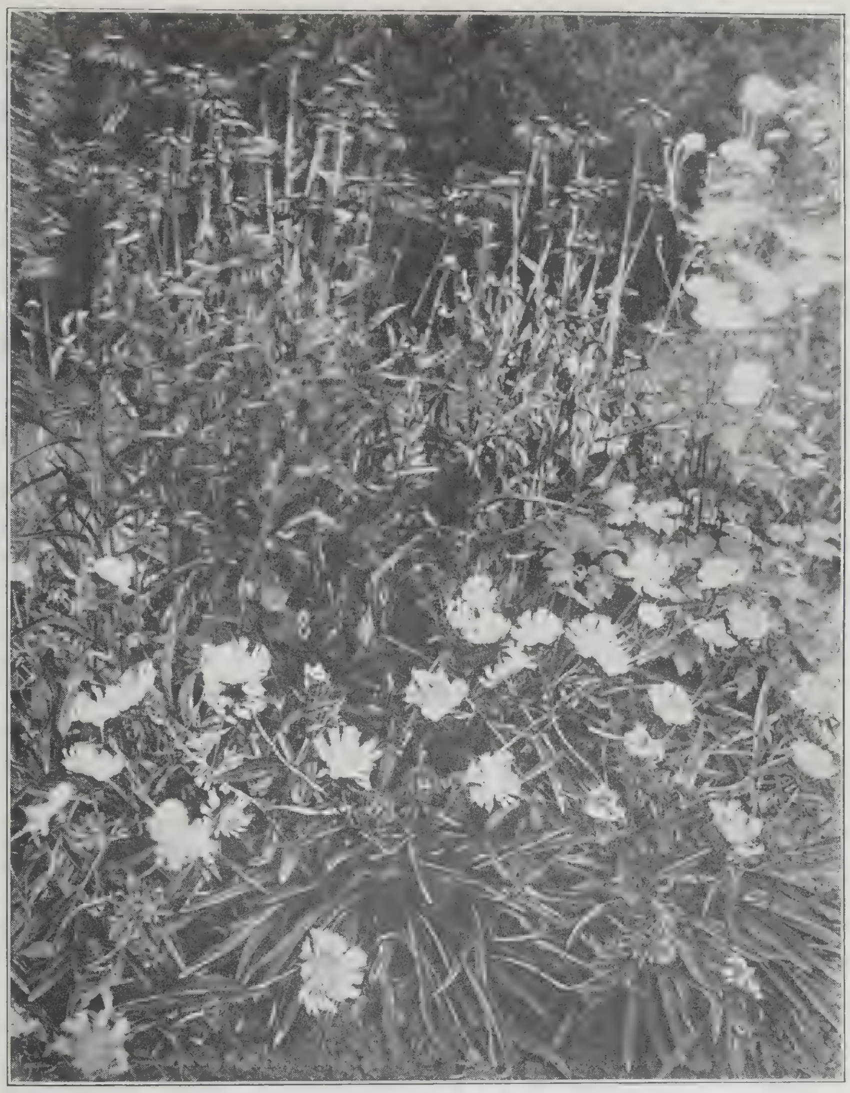
D. Belladonna, although an old kind not excelled as a light blue, and especiall wanted for cutting.

D. Hendersoni (dark blue), which is fine. In my early days we used to call th plants Oxford and Cambridge. When s in big groups or en masse the effect is fine and they are useful in giving colour the conservatory. J. C

Beaconsfield.

Stokesia cyanea

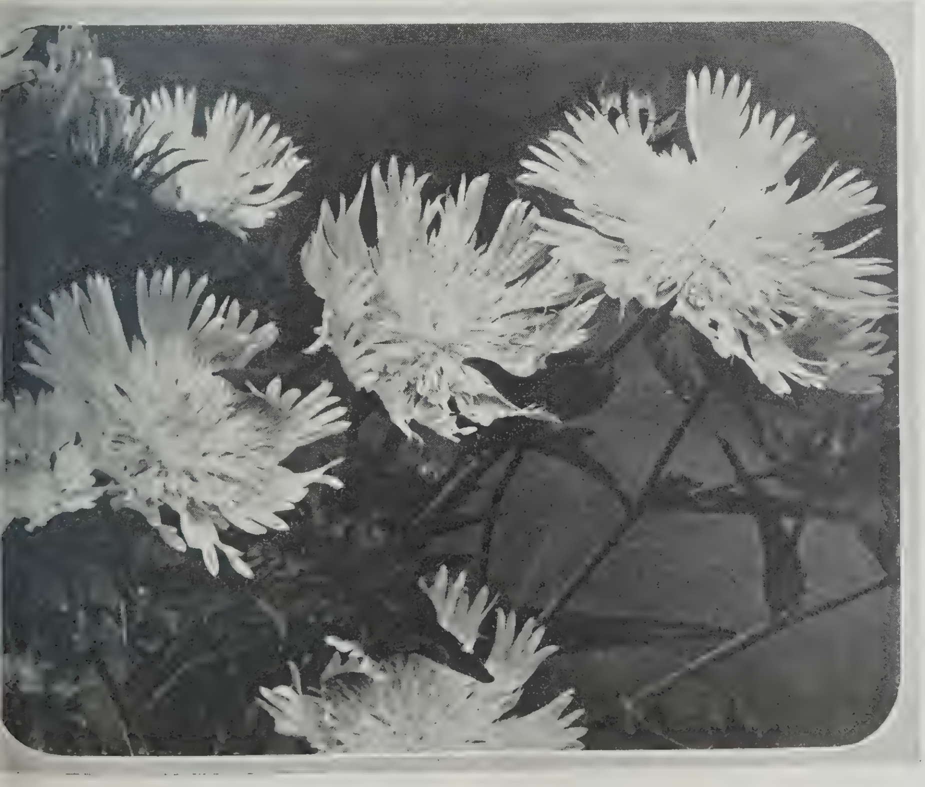
HERE are two forms of Stokesia
cyanea, differing only in time of flower-
ing. The older one flowers in late
ımn and, except in warm localities, fre-
ntly fails to bloom owing to early frosts.
as at one time largely grown in Scotland
exhibitors of hardy herbaceous flowers,
in most seasons had to be potted and
ed under glass to be in time for August
early September shows. This older
n went largely out of cultivation in cold
ricts owing to this frequent failure to
er and its late blooming when it did open
erly. Within, I think, the last five-and-
nty years a form which blooms early was
oduced under the name of S. cyanea
cox, and this blooms in good time and
s for a long period in flower. By the
, there was a very rare white variety of
old form, and there is also one of the
y one. S. ARNOTT.



The early-flowering form of Stokesia cyanea, in association with Coneflowers and Anemone japonica

argoniums with fragrant leaves

seems a far cry to the day when scented-
ed Geraniums formed part of the collec-
of plants found in most greenhouses,
it would almost seem that interest in this
s had died out to a large extent, yet
ly among lovers of old favourite
aniums, these have a claim. One of the
ivors is the well-known dark green Oak-
ed—Nelson by name—and there is a
te veined variety of this. Royal Oak has
ery pungent smell, with small crimson
ers. Citrodorum, as its name implies,
itron scented. One very ancient sort is
rant of peppermint, and is named Bulls-
Clorinda. It has about it the fragrance
he Oak-leaved varieties, but yields many
-pink flowers. This is worth looking
r because of its pendulous habit, which
es it useful for hanging baskets and
dow boxes; also for growing as stan-
ls. Crispum, with very small leaves
ch lie close together—the plant growing
n upright fashion and highly perfumed—
another of these once-thought-much-of
aniums. As window plants they are worth bearing in mind in this, their propagating season, as with little warmth they can be kept in the window of a room the year round where the conditions do not fall much below 55 degrees. That is why one meets with these scented-leaved plants of a bygone generation in many out of the way villages as window plants, sometimes growing to a huge size. WOODBASTWICK.



A nearer view of Stokesia cyanea

The Anthemis

This plant is of the composite order and nearly allied to the Chrysanthemum and Matricaria. Several of the species are hardy native plants. A. nobilis is the common Camomile of cottage gardens, and A. arvensis the Corn Camomile. The most elegant of all, however, is A. tinctoria, with large yellow flowers, which has been cultivated in gardens for many years on account of its pretty blossoms. Few plants are more easily cultivated than the Anthemis; any kind of soil will suit them, but on the whole they prefer a fairly light one and are not particular as to position.

The usual way of increasing stock is by cuttings, but as they produce seed freely they may be increased by this means also, but seedlings of the choice named kinds cannot be depended upon to come true. A. aizoon is only 3 inches to 4 inches high, with small white flowers. It is a very pretty little Alpine plant. A. canescens, with foliage and white blossoms, is a trailing or prostrate plant.

F. H.

THE ROYAL·HORTICULTURAL·SOCIETY'S GREAT·AUTUMN·SHOW

NEW POLICY OF THE ROYAL HORTICULTURAL SOCIETY

Cloud banks of Asters—The first Autumn Show, September 19th-20th, chiefly for open-air plants and Roses

A Random Commentary

THE autumn show has inevitably lost something of its glory by sub-division, but some relief from the intolerable overcrowding of last year was imperative, and on Thursday and Friday it was possible to see the plants in comfort and almost at leisure. It was the greater pity that the lustre of the show was further slightly dimmed by the merciless drought; which has fallen hard on the late-flowering plants, since they depend upon the autumn rains for their full development.

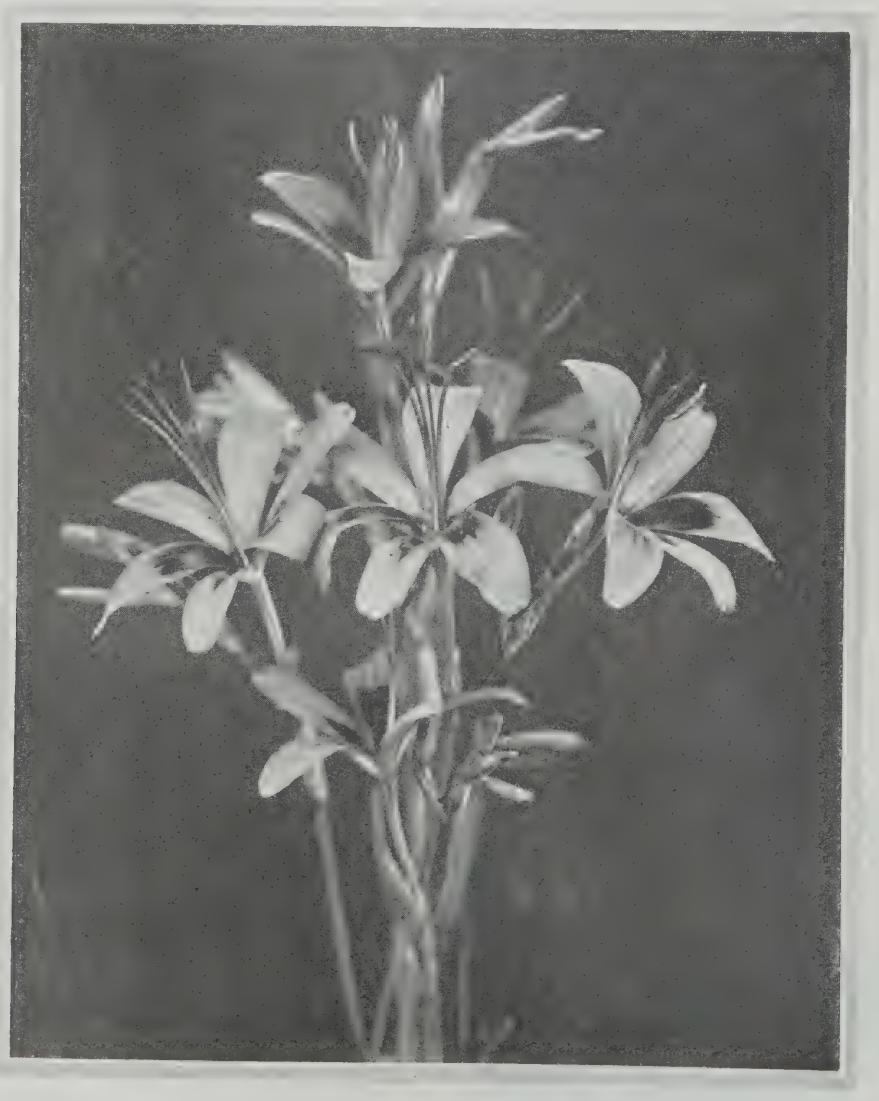
The Old Hall, which looks rather dowdy and dilapidated now beside its successor, has a homely feeling to old frequenters, and I was glad that it was not used merely as an overflow, but was given over mostly to Roses and Alpines. The Roses were not, obviously, affected by the rainless summer, but seemed to show that depth and richness
of colour in which, I think (though it
be fancy), the autumn Roses often
those of the earlier flowering. McGr
Ivory is a fine new Rose, solid, cr
tinted, and buxom, with a strong but de
Tea Rose scent. The names of the c
would be familiar to every gardener. I
ing over them in general one markec
absence of a clear, sulpur-yellow among
varied and sometimes intense colours. T
are good yellow Roses, of course, but
in the best of them there is that faint hi
brown which tends to make a yellow sli
hot and opaque.

There is among the Roses of recent i
duction a scarcity also of pure pink sh
The re-introduction of the Austrian Bri
a parent provided, with sudden facilit
vast number of Roses in blended pink
yellow. This combination of colour s
to fascinate the raisers of new flowers,
haps because it is rare in Nature, so th
is tending to become the keynote of
modern flower garden; where it has br
out in Lupins, Gladiolus, Pæonies,
Mulleins, and even the purity of
Daffodils is threatened with what the
physicians used to call a "sanguin
effusion." It is not that a blend of pink
yellow is ugly in itself—it is borne suc
fully by the somewhat reluctant Lewisi
but it is a risky mixture, especially i
setting of green, and it has the disadvant
from the point of view of pure æsthetics
suggesting something sweet and edible.

The rock garden is not at its brilliant
in September, but no one could have b
unimpressed by the delicate beauty of
rock garden made by Mr. Ingwersen v
dwarf conifers, grey rocks and shingle, g
tufts of grass and groups of "Na
Ladies" blushing together under the d
trees. This charming folk name, "Na
Ladies," is so appropriate that it has b
given to the Colchicum in almost all
countries of Europe; and it is a pity tha
plant so easy, permanent, and beaut
should not be as common in our gardens
the Daffodil. In this same grey rock g
den was an exquisite little Lupin (*Lupi*
Lyalli), 3 inches high, with silvery-gr
leaves and miniature flower-spikes in c
lavender. It is rare in cultivation, bu
welcome newcomer, for it is perfectly in p
portion and need not be compared with
quite different beauty of its tall sisters.

In the New Hall

Just inside the New Hall there was an i
posing bed of Lilies, some massive a
superb, others self-consciously elegant,
wonderfully well grown and displaying to t
full that peculiar quality of Lilies that e
dears them to most people and leaves oth
a little cold, even repelled. Perhaps t



Lapeyrousia grandiflora, native of Zomba, a beautiful bulbous plant, flowers clear scarlet with deep velvet crimson blotch at base of petals

Shown by Amos Perry. Award of Merit

An effective group of Dahlias from Crawley on the floor of the New Hall

is due merely to the great size of the
s in comparison with the design of the
a disproportion that we are liable to
sise in the garden by forgetting that
Lilies grow in long grass or out of
thick undergrowth.

nd the Lilies were cloud-banks of
lmas Daisies; not quite so fine, per-
as they were last year, but bringing
to us how much this flower has been
ed in recent years. It was not so
ng ago that our Michaelmas Daisies
not only small, but dingy, almost
lly inconspicuous in the background
shrubbery; now they come in galaxies
le-eyed flowers to bid farewell to
one. Their tones of clear, cool
r, ecclesiastical violet, and faintly
grey are so admirably suited to their
that it seems a pity that the raisers
strain so hard after a blue, and it is
re to be regretted (as correspondents
RDENING ILLUSTRATED have pointed
ently with some acrimony) that their
and imagination have so far outrun
erformance that many good Michael-
aisies are mis-named "Blue this-
d-the-other." The value of such a
ariety as Ultramarine is depreciated
idiculously misleading name.

were not many individual plants to
nd hold the eye as you walked round
ll, but in the bewildering brilliance
inevitable in a large flower show
ere one or two plants of merit that
e more conspicuous because they were
tatious. Messrs. Maxwell and Beale
a double variety of Ling with long,
flower-spikes, Erica vulgaris H. E.
which seems likely to prove a valuable
to the Heath garden. And it was
t to see in one exhibit the glistening
louds of that old-fashioned Everlast-
aphalis nubigena. Vernonia Arkan-
own by Messrs. Gavin Jones, is an
on plant that at first sight seems
ht ugly with its dark, dusty leaves
ggy flowers of reddish-purple, but it
reat deal of character and its peculiar
ould probably prove very interesting
ination with plants of similar shades.
same exhibit was our native Horned

Poppy, which surely deserves to be seen more often in gardens, and a hybrid of it, Glaucium corniculatum rubrum, whose tomato-red flowers contrast startlingly with its grey foliage.

Among the new and noteworthy plants the most striking was Lapeyrousia grandiflora, shown by Messrs. Perry, which is in effect L. (Anemotheca) cruenta doubled in size and of the same strange brilliance of vermilion and crimson. The smaller species is so much more hardy than might be expected that one is tempted to hope that L. grandiflora, though described as a greenhouse bulb, might also be willing to flourish in a sunny, sandy border. Messrs. Perry showed also a very curious new plant, Nuphar japonicum rubrum, which looks just as though our native yellow Water Lily had been modelled in green and red sealing-wax by a Japanese artist.

Ceanothus Powder Blue, a hybrid of C. thyrsiflorus and C. indigo, raised by Messrs. Burkwood and Skipworth, has flower-heads of misty, greyish-lavender and is said to be evergreen and quite hardy. H.

The Autumn Show

By Sir WILLIAM LAWRENCE, Bart.

While there is no doubt that this was a notable show, there was something not altogether pleasing in the fierce masses of colour unrelieved by shrubs. To my mind, it is unfortunate that the exigencies of space and established habits combined result in as many flowers as possible being crowded into one group. Sir Jeremiah Colman told me that he has sometimes exhibited Orchids and stove plants arranged for effect, but that such a group would have no chance of a Gold Medal as it would be considered that there were not enough plants. Until exhibitors can be allotted much larger spaces and can display their Roses, Dahlias, herbaceous flowers, etc., in large isolated baskets or vases, I am afraid we must go on as we are. To my mind the arrangement of the magnificent Roses round the Old Hall was most unpleasing, and I have hopes that next year the Roses will be arranged in the body of one or other hall—the New Hall, I hope, as Roses last so very much better in that atmosphere; the Roses in the Old Hall were full-blown by 2 p.m. on Thursday afternoon.

The exhibitors of rock gardens did their best with the material at hand, but it is clearly a mistake to try and show rock plants in September; I think it would be better to do away with this class and give the space to the firms which were cut down. This would be no hardship, as I asked one or two rock garden men what business was like, and they replied "rotten."

Just as Lord Kitchener disliked cats, I am not very fond of Dahlias, but there are exceptions to all rules, and one or two Dahlias took my fancy, especially a Dahlia called Fogo, which had a new and pleasing shape and a very fine colour; Colour Queen was a

Roses round the Old Hall in competition for the Wigan Challenge Cup for the best exhibit of Roses

most lovely thing, and some of the Pompon varieties were charming. I noticed in this class Bacchus, Rosalie, and Nerissa.

The new plants proved a very dull lot, with the exception of the beautiful Lapeyrousia grandiflora shown by Mr. Amos Perry.

It is sad to think that only one amateur staged a group at the show, and I understand that at the show of ornamental trees and shrubs on October 2nd there is not a single amateur entry. The truth is, most amateurs cannot afford to show nowadays.

William Lawrence.

LIST OF AWARDS

THE WIGAN CUP

For the best exhibit of Roses staged on an area not exceeding 100 square feet.—To Messrs. T. Robinson and Son.

GOLD MEDALS

R. H. Bath, Ltd., for Gladioli; Blackmore and Langdon, for Begonias; Alex. Dickson and Sons, Ltd., for Roses; Dobbie and Co., Ltd., for Dahlias; J. B. Riding, for Dahlias; T. Robinson and Son, for Roses.

SILVER CUP

S. McGredy and Son, for Roses.

SILVER-GILT LINDLEY MEDAL

Hon. Mrs. Montagu (gardener, Mr. J. E. Fitt), for Montbretias.

SILVER-GILT FLORA MEDALS

Dickson and Robinson, for Dahlias; J. W. Forsyth, for early-flowering Chrysanthemums; H. J. Jones, for Dahlias; K. Luxford and Co., for early-flowering Chrysanthemums; Amos Perry, for aquatic and waterside plants; G. Prince, for Roses; W. Treseder, Ltd., for Dahlias.

SILVER-GILT BANKSIAN MEDALS

T. Bones, for Michaelmas Daisies; Chaplin Bros., for Roses; Jarman and Co., for Dahlias; Kings Acre Nurseries, for Dahlias; M. Prichard and Sons, for herbaceous plants; J. Stredwick and Son, for Dahlias; R. Wallace and Co., Ltd., for Lilies and other herbaceous plants; W. Wells, Junior, for Michaelmas Daisies and other herbaceous plants; H. Woolman, for Dahlias and early-flowering Chrysanthemums.

SILVER FLORA MEDALS

Barr and Sons, for Montbretias, Michaelmas Daisies, and other herbaceous plants; Ben. R. Cant and Sons, for Roses; Carter Page and Co., Ltd., for Dahlias; Dowtys Rosery, for Roses; Gavin Jones, for herbaceous plants; B. Ladhams, Ltd., for Lobelias and other herbaceous plants; J. H. Pemberton, for Roses; M. Prichard and Sons, for rock garden plants; D. Prior and Sons, for Roses; L. R. Russell, Ltd., for water and rock garden plants; J. T. West, for Dahlias.

SILVER BANKSIAN MEDALS

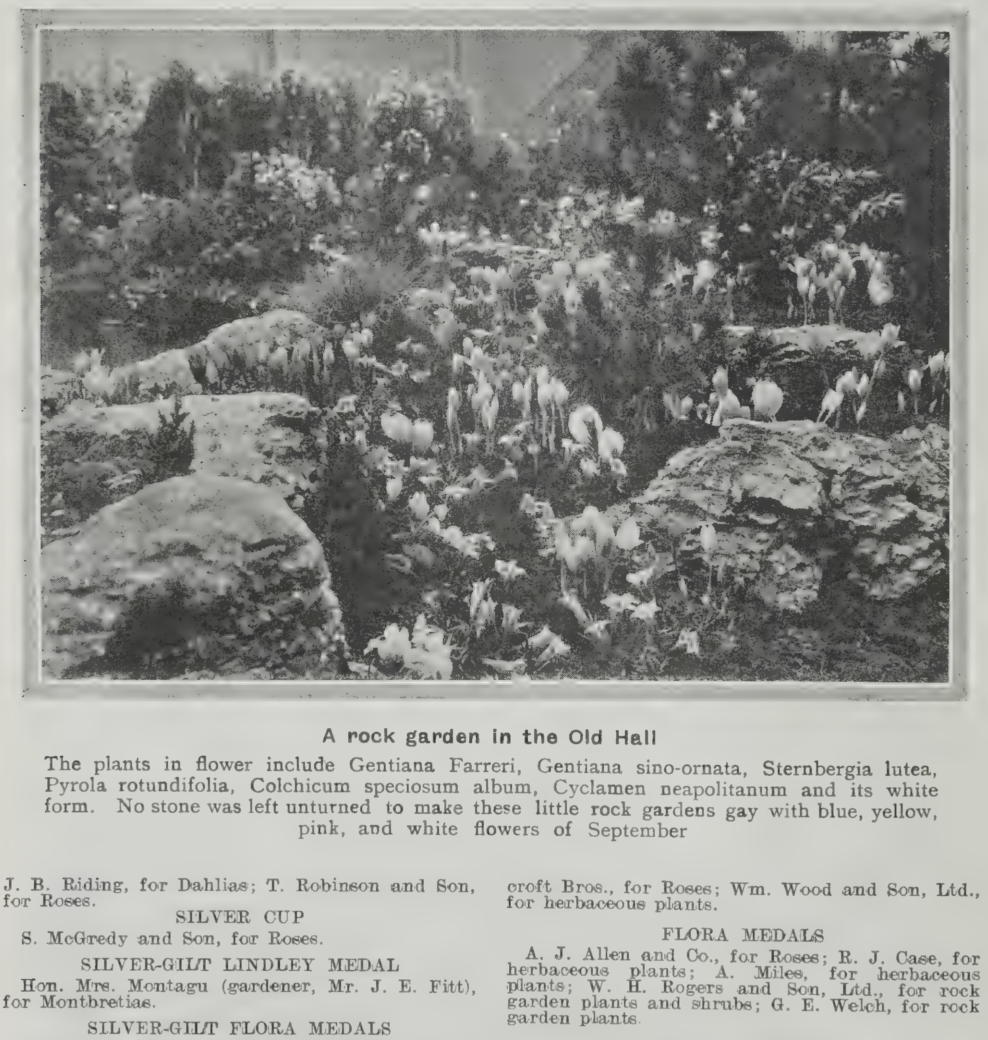
J. C. Allgrove, for Roses; Allwood Bros., for Pinks and Border Carnations; Bakers, Ltd., for herbaceous plants; E. Ballard, for Michaelmas Daisies; G. Bunyard and Co., Ltd., for Asters and other herbaceous plants; J. Cheal and Sons, for Dahlias; W. Easlea and Sons, for Roses; Clarence Elliott, Ltd., for rock garden plants and dwarf conifers; E. F. Fairbairn and Sons, for Phloxes; J. Forbes, Ltd., for Phloxes, Pentstemons, and Dahlias; Gayborder Nurseries, for Michaelmas Daisies; Harkness and Sons, for herbaceous plants and Gladioli; R. Harkness and Co., for Roses; H. Hemsley, for Dahlias and hardy flowers; Hewitt and Co., Ltd., for Roses; Hewitt and Co., Ltd., for Delphiniums; Elisha J. Hicks, for Roses; Isaac House and Son, for Scabious and Tritomas; W. E. T. Ingwersen, for rock garden plants and dwarf conifers; G. Jackman and Son, for herbaceous plants; James MacDonald, for grass garden; Maxwell and Beale, for rock garden plants; Oliver and Hunter, for herbaceous plants, bulbous and rock garden plants; Rich and Cooling, for herbaceous plants; T. Smith and Sons, for Roses; Stanway Rose Gardens, for Roses; Miss S. S. Thompson, for Cacti; Warner and Son, for Roses; Wheatcroft Bros., for Roses; Wm. Wood and Son, Ltd., for herbaceous plants.

FLORA MEDALS

A. J. Allen and Co., for Roses; R. J. Case, for herbaceous plants; A. Miles, for herbaceous plants; W. H. Rogers and Son, Ltd., for rock garden plants and shrubs; G. E. Welch, for rock garden plants.

BANKSIAN MEDALS

Backhouse Nurseries, for rock garden shrubs and plants; G. and A. Clark, Ltd., for herbaceous plants; H. Clarke, for Dahlias; W. Cutbush and Son, Ltd., for Michaelmas Daisies and Dahlias; P. Gardner, for rock garden plants; G. Gibson and Co., for rock garden plants and dwarf shrubs; S. J. Goodliffe, for Dahlias and herbaceous plants; Hillier and Sons, for water and rock garden plants; W. Keep and Co., for herbaceous plants; Kings Acre Nurseries, for early-flowering Chrysanthemums; Little Munden Nursery, for herbaceous plants and Dahlias; Orpington Nursery Co., for Gladioli; Amos Perry, for herbaceous and bulbous plants; E. J. Redgrove and Son, for herbaceous plants and Gladioli; G. Reuthe, for herbaceous and rock garden plants; F. Rich, for herbaceous plants; J. Robinson and Sons, for rock garden and hardy plants; W. H. Simpson and Sons, for Antirrhinums and Montbretias; Tuckers, Ltd., for herbaceous and rock garden plants; Charles Turner, for Dahlias; G. E. P. Wood, for rock garden plants; Wm. Yandell, for Dahlias.



A rock garden in the Old Hall

The plants in flower include Gentiana Farreri, Gentiana sino-ornata, Sternbergia lutea, Pyrola rotundifolia, Colchicum speciosum album, Cyclamen neapolitanum and its white form. No stone was left unturned to make these little rock gardens gay with blue, yellow, pink, and white flowers of September

New Dahlias

Varieties selected for trial at W

Forty-one new seedling Dahlias w mitted to the Joint Committee of th Horticultural Society and the N Dahlia Society on the occasion Great Autumn Show on Thursday, ber 19th. The following varietie selected for trial next year at Wisley:

Margate Star.—An attractive acq to the Star section. The flowers ar 3½ inches in diameter, and have rath row grooved florets, and are borne stems. Colour, yellow centre, pas bronze and rose at tips of florets. Sh Messrs. J. Cheal and Sons, Ltd., C Sussex.

Mysore.—A pretty small-flowered pointed, building a flower about 7 across, evenly recurving. Colour, Very stiff, erect stems, devoloping th at a good angle. Shown by Messrs. J wick and Son.

W. F. Balding.—Another very la corative Dahlia, having broad, flat quilled-like at the ends and slightly building a bloom about 9 inches in di Colour, rosy-fawn. Shown by Messrs wick.

Nagpur.—A welcome addition Camellia-flowered section. The flo fairly broad and reflex in even man veloping a bloom from 3⅛ inches to 3 in diameter. Colour, brilliant scarlet. by Messrs. Cheal.

Paulia.—A small-flowered Pæony-f Dahlia, having fairly broad florets at the ends, developing a bloom inches across. Colour, bronzy terr Shown by Messrs. E. Burrell and Co. bridge.

Eda.—Another interesting small-f Pæony, having broad, pointed florets twisted. The flowers are about 4 in diameter, and their colour may be d as bright orange, margined rosy-c Also shown by Messrs. E. Burrell an

D.

Two new certificated Chr themums

The two undermentioned early Chry mums were shown before the Flora mittee of the Royal Horticultural Soc September 19th last and both gai Award of Merit.

Kingcup.—An attractive variety for culture. The blossoms are borne in sprays, and individual blooms are co of narrow florets of reflexing form, b useful decorative flowers. Colour golden yellow. This variety was r certificated by the National Chrysantl Society.

Mrs. W. D. Cartwright.—A pro Early for market or for the garden florets are of medium breadth, inde the end, and develop a full reflexed bl good form about 5 inches in dia Colour, yellow. Both shown by Shoesmith, Jnr.

D. B. C

Globe Tulips

At a first glance these plants would taken for Tulips. In fact, they belong Calochortus group, of which the M Lily is a much better known represe They are pleasing plants, with dr globular flowers of white or pink or on upright stems. Each bulb carries o and from six to twelve flowers. T best in shade and are quite at home

where they are, with no thought of
g out until a change in the weather.
not know what has been the ex-
e of flower lovers in other districts
where, like us, they have had the prolonged drought with no intervening thunderstorms and the inability to resort to artificial watering. Here it is interesting to note that some of the old flowers upon which we are, perhaps, inclined to look somewhat scornfully have come most satisfactorily through the ordeal. They have not only flowered well, but have preserved a fairly green, healthy foliage right up to the present time. Rockets, Heucheras (hardy), Fuchsias, Larkspurs, and Carnations are a few examples, whilst in annuals we have been very glad of the homely Marigolds in varying heights, dwarf Nasturtiums, and Cornflowers in different shades. "Not much variety in the above," some may say, but in a season like the present the small grower is thankful for a few things that have helped to brighten his home and garden. E. B.

Bucks.

Polyanthus as a pot plant

To the amateur especially do I recommend the Polyanthus as a pot plant for winter decoration. It may be grown in pots from 5 inches upwards. It is of the utmost importance that the plants are obtained from the best strains. A beginning may be made by obtaining seed, sowing under glass, and, when strong enough, pricking them off in a somewhat shady position, and in the autumn planting out in a similar place where they can bloom and be selected to colour. The following autumn these can be potted into the size needed (this should be done early), and as the days shorten they should be put under glass, where they will soon commence to flower. If there are plants enough they should be changed, as this will be helpful to them, and the following autumn they will be fine to plant in the open in any position.

Beaconsfield. J. C.

R.H.S. Examinations, 1930.

The examinations of the Royal Horticultural Society will be held in 1930, as follows :

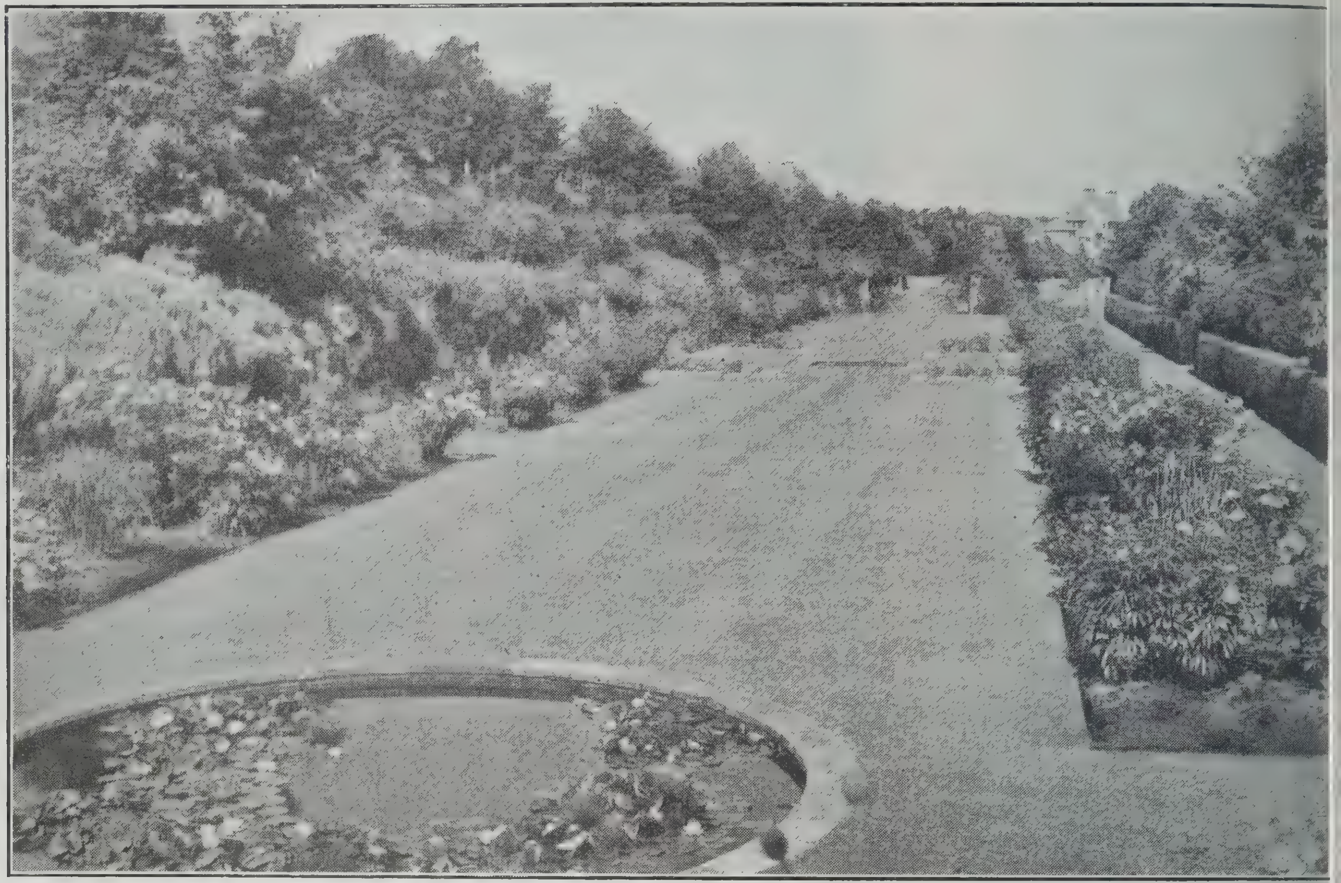
WRITTEN EXAMINATIONS.

		Entries close
General Examination (Seniors and Juniors) ..	Wed., Mar. 12th ..	Jan. 13th, 1930
Teachers (Preliminary and Advanced)	Sat , Mar. 22nd ..	Jan. 13th, 1930
Scholarship Examination	Wed., April 30th ..	Mar. 31st, 1930
National Diploma (Preliminary and Final) ..	Sat., May 3rd ..	Feb. 1st, 1930

PRACTICAL EXAMINATIONS.

Teachers' Advanced ..	Fri., June 12th
N.D.H. Preliminary ..	Tues. and Wed., June 17th and 18th
N.D.H. Final	Thurs. and Fri , June 19th and 20th

All entries, except those for the National Diploma in Horticulture, should be made on the form in the syllabus obtainable from The Secretary, Royal Horticultural Society, Vincent Square, Westminster, S W. 1.



Pæony borders, Water Lily pool, and broad grass walks in Mrs. Graham Wood's well-designed garden near Guildford, Sur

Herbaceous Pæonies: Planting in Autumn

QUITE a number of lovers of hardy plants, who formerly looked upon herbaceous Pæonies as subjects that could not be expected to flower with anything like freedom for several years after planting, are waking up to the fact that such impressions are erroneous. It has always been something of a mystery to me why such an idea got about, and I can only attribute failures with them to the unpreparedness of the soil, and in not taking advantage of getting in the clumps at the best possible time, that is the autumn. There is nothing difficult about growing these showy flowering plants, provided that the positions they are to occupy in a garden are made ready for them, but no one must expect them to become established soon and start on their flowering career who does not go to some trouble in providing for them suitable rooting medium, and what is equally important, in selecting places where the roots may be left undisturbed for several years. It should be understood that Pæonies are impatient of removal, and that if they are given a rich feeding ground from the first there is no necessity to meddle with them, because they improve from year to year, giving more and finer flowers once the roots get into good ground. It is not to be inferred from this, however, that clumps cannot be planted in spring, but greater success, with a minimum of loss, mostly follows autumn planting. I therefore counsel those who are contemplating putting down Pæonies to give them the best chance, and plant now, so that by spring, when growth begins to push out, they will not be subject to the drawbacks of a dry time to the same extent, should one follow. Pæonies thrive best in a deep, rich soil; one, for instance, which contains plenty of humus; and this being so, supposing it is intended to plant in a border, it is best to take out the existing soil to a depth of 2 feet or even 3 feet, and at the bottom work in what old manure is possible, stable, or old cow dung. Failing these two, use hop manure, incorporating with the soil any old vegetable refuse from the garden. After treading it down, put in the clumps so that the crowns are just under the surface. The point is worth emphasising that the ground to be occupied by these plants cannot be made too rich, and if it is possible to use some friable turf loam with the existing soil, it will be all to the good, as they must be regarded more in the light of permanent subjects about a garden that are best left alone when doing well. It is time well spent in making the ground suitable for them before any planting is done. If it is intended to adorn a border with them, they should be given ample room for development right from the start; there should be no cramping in order to save space, and those who are about to plant will do well to give each clump not less than 3 feet from its neighbour—more, indeed, if they are to be grown between tall growing things like Larkspurs, or avaricious feeders such as Hollyhocks and Helianthuses. Liberality in the matter of rich soil, and plenty of room for growth afterwards, will not be begrudged when Pæonies come to their beauty stage. Should the spring be dry, copious waterings will be helpful, and once the roots have become established applications of weak liquid manure will contribute to the upbuilding of the plants and in the improvement of the peerless flowers.

If it is possible to choose positions for Pæonies, it will be better to select
facing south-west, or west, for the
that if planting is carried out on grou
ing north or east, the young growths
infrequently injured by frosts in early
This may not be appreciated by the on
ing them for the first time, and rath
run such risks it is better to avoid
clumps in exposed places.

To-day there is a wide choice in Pæ
the disposal of the purchaser of clum
in double and single. The huge tru

ifty Years Ago

Remedy for mildew

T a recent meeting of the Academy of Sciences in San Francisco Dr. Arthur W. Sara, anta Clara, made, according to the airie Farmer," a statement of a s of experiments made by himself ung the past few years, to the effect a solution of copper, sprinkled Grape vines just before the ing of the buds, is far better than hur to prevent mildew, being per and more easily applied. He d that during no season had he any sign of mildew when he used solution, but that one year he ected to apply it, and the result that the vines were badly affected. —*ptember 27th*, 1879.

the Kentish fruit gardens

regards hardy fruits, Kentish eners have this year little to attention, for orchards from h in some years thousands of els of fruit have been sent to the don markets are this year almost less, and it is only in a few gar-, such as that of Mr. Lewis ck, of Langley, to which our visit specially made, that anything like one-third of a crop can be found. Hops, too, on which so many le in Kent depend, are this year a tful crop, being badly infested mildew and "vermin," as the n and Black Fly are called.—*ember 20th*, 1879.

nothus Gloire de Versailles

TUNATELY, this beautiful hybrid nothus is one of the hardiest, and in but the worst of the British climates grown freely in the open. It also vigorous pruning, forming short each of which carries a large cluster rey-blue bloom. As it can be easily into neat bushes it can be used with fect in flower borders of fair size, g well with white Dahlias behind and napdragons in front. It is also one nost important plants in our borders and purple flowers with a quantity of iage. G. J.

-grown Dahlias at Thame Show

of the most noteworthy features of section of the Thame (Oxon.) Show, September 19th last, was the superb of Dahlias set up in the private tent r John Walker, Thame. This old-ned firm has for generations been identified with the development of lia, and the display above referred to intained the high reputation enjoyed Dahlias that I have seen for a long st have approached the excellence of ms set up on this occasion. Minia-vered Pæony Dahlias were in ideal nd condition, a few of the better being Our Annie, Dazzle, of Llandaff, Doreen, Seafield, Nut-iory, and Winifred Walker. Form and colour were quite remarkable. Cactus-flowered Dahlias were never better shown or seen in such varieties as Mrs. A. Harvey, Johannesburg, Mary Purrier, Ballet Girl, F. W. Fellowes, Grasmere, and Edith Jones. Seldom have the Star Dahlias been seen in such beautiful form and colour, notable examples being Leigh Star, White Star, Ifield Star, and others. That charming Cactus-like decorative, Andreas Hofer, was shown in wonderful form and colour, as were others far too numerous to mention. It is good to see the present generation of the descendants of the original member of this firm giving such an excellent account of their work as that exemplified in the wonderful exhibit under review. D. B. CRANE.

Parochetus communis

Of the many good flowers about which we confess to having doubts as to whether they can be retained in our gardens through even an average winter, Parochetus communis, the Shamrock Pea, may be considered one of the most alluring. It is absolutely hardy in many gardens in the south and west of England, in the south-west and west and, in some gardens, in the east of Scotland near the sea; while the Emerald Isle can boast many districts where this lovely plant forms sheets of flower and gives no anxiety except to keep it from throttling less vigorous plants. There are, however, numerous gardens where its continued culture is hopeless unless one adopts the process of taking cuttings and pieces of the plant and keeping them under glass in winter—rather an unsatisfactory thing to practise where there is a large collection of plants.

Yet the Parochetus is worth some care, even although it may be lost in the open every few years. It quickly creates trailing, spreading masses of Clover-like leaves, decorated in late summer and autumn with many wonderfully coloured Pea-shaped flowers, solitary on each stem of 3 inches or so. The colour of these blooms is difficult to describe. It is mainly blue, with a touch of yellow, but passes off in various delightful hues and tints. It loves the sun in most places, and can also appreciate a warm, swampy place. I recollect seeing it in that once noted garden of the late Miss Anderson at Barskimming, Ayrshire, where that flower-lover grew it well in a sunny nook in a glen. In cold districts the sunny moraine affords an excellent medium where the space can be spared. If left alone it will form masses yards across. S. ARNOTT.

Ceanothus Gloire de Versailles

REMINDERS FOR THE WEEK

Southern and Midland

Perpetual flowering Carnations

Spraying overhead must now be discontinued except following unusually dry, warm days. Even then all foliage should be dry by night, a little moisture, however, being permitted among the pots for the present. Blooms on short stems, or any showing signs of disfigurement, should be broken out at once. Disbudding and staking will be constant and essential, but the amount of air left on the houses at night should be slightly reduced. Heavy feeding should not be indulged in at this stage, although a light stimulant may be applied to well-rooted specimens at intervals of 10 days or so.

Bouvardias, Primulas, Cinerarias, Cyclamens

Those which have been growing in cold frames should be placed in cool pits or houses where they will be secure from frosts. Heat is rarely needed at this date for either of these, but it is advisable to be prepared should occasion arise for its use. Cinerarias may still be potted on if especially large plants are desired, and a little moisture permitted among their pots. Fumigate these occasionally, and thus prevent the development of Green Fly, and if Leaf Miner proves troublesome spray the plants with Quassia and Nicotine.

Fruit trees under glass

Copious waterings are still necessary, even though all the fruit has been gathered, and of equal importance is the daily syringing of the trees, for if left to themselves Red Spider will become exceedingly troublesome, and cause a good deal of injury and disfigurement.

Tomatoes

Those grown as fill-ups in early fruit-houses are practically spent, and should be removed in order that air and light may circulate freely over all parts of the trees, and until the houses are filled with Chrysanthemums and other plants the ventilators should be thrown wide open in order that the trees may ripen and mature their wood.

Tomatoes in the open

Gather the fruits when partially coloured, and finish them on a sunny shelf, as if left in the open they are almost certain to crack. This will also enable feeding of the plants to be carried on.

Bedding plants

Bedding plants which were struck in boxes in the open should now be placed where covering lights may be drawn over them in case of need. Cold frames will be found quite suitable for the present, as the lights may be drawn over the plants should heavy and continuous rains set in.

Potatoes

Lift and store all Maincrop Potatoes, care being taken to prevent any tubers showing signs of disease being included, especially where it is necessary—as it is in my case—to store a quantity in clamps in the open. Leave all sorting for the present, as this will provide congenial employment during the dull, wet days which are sure to come. When stored in clamps air spaces must be left at the top for a time to prevent sweating.

Celery and Leeks

These crops require considerable attention now, earthing-up being frequently necessary. Care must be taken to see that the soil is pressed firmly around the stems, otherwise disfigured specimens will result. Watering these crops is a little difficult, but if the weather proves dry and hot it must be frequently given at the nearest point to the roots and allowed to soak its way in.

Late Peas

These have been plentiful, but in order to maintain a supply watering and feeding must be freely indulged in, as the vast amount of haulm throws average rains quite clear of the roots. If whitethroats and other small birds prove troublesome, ¾-inch nets will have to be spread over the rows.

The autumn programme

Various changes having been decided upon during the past season, no time should be lost in getting loam, manure, sand, and other materials placed at convenient points in readiness, so that little time may be lost once a job is started. Fruit trees may be safely moved once the leaves have begun to fall if a soaking is given on completion. New borders may be trenched and prepared in readiness for planting during the latter end of October, and plants may be ordered and heeled in in readiness.

Bulb planting

Both in beds and in grass bulb planting should now be taken seriously in hand. Crocuses are very effective when grown in broad bands around beds, also grown in quantity in mixed colours beneath deciduous trees.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Care of the Asparagus beds

As soon as the stems are ripe they should be cut over some 3 inches from the ground. Any weeds present should then be cleared off, a generous layer of stable manure placed over the whole surface of the beds, and, in very exposed positions, a few Pea stakes, or such like, laid over this to prevent its being displaced by the autumn and winter gales.

Lift and store early Beetroot

There is nothing to be gained by leaving the Globe Beets longer in the ground; so, on a dry day, have the crop harvested and stored past in a cool, dry place, using plenty of dry sand or dry sifted soil between the layers of bulbs. It is always desirable to use these Turnip Beets first, as they do not as a rule keep so well as the long sorts.

Earthing of Celery

In most cases the final earthing-up of this crop may be carried out within the next few days. Select a dry day for the job and make the soil nice and firm (not hard) around the plants. Raise the ridge a little in the centre, and beat the sides firm and smooth so as to shed as much of the rain as possible, and thus help to prevent rotting of the stalks.

Spring vegetables

Providing the surface of the ground is fairly dry, continue to hoe between rows of Cabbages, Onions, and Spinach, not only to keep down weeds, but to encourage firm, sturdy growth of the various plants, in order that they may be in proper condition to withstand the winter.

Root-pruning fruit trees

While this is a dirty, disagreeable business at the best, it will, if properly carried out on very luxurious trees, usually induce them to fruit. About this time is a very suitable season for having the work carried through, for by so doing the presence of the leaves on the trees is a great aid to th
and as they have still several weeks
really cold weather sets in, they will
abled to get a good hold of the ne
This must not be rich, but fresh and

esult of a cross between a Sophro-Lælio-Cattleya and a Brasso--Cattleya. Colour deep yellow, with vermilion labellum over orange ground

First-Class Certificate. Shown by Baron Schröder

Silver Spray, showing flowering tips only, a light and graceful Michaelmas Daisy of the Cordifolius section

The long arching sprays are crowded with small pale-lilac flowers, producing a dainty effect. Shown at the R.H.S. Autumn Show by Mr. Ernest Ballard, the raiser of many new Asters

brief hints on the cultivation of Michaelmas Daisies

ERNEST BALLARD, of Colwall, ar Malvern, the well-known raiser of any new Asters, gives the following on the cultivation of his favourite —

not too strongly urge growers, if they get the best results, to allow at most e than three stems on each plant to in some instances one stem is t. Cut out all others and do w a score of stems to grow up, one ll give more blossom, finer flowers, er-shaped plants. You do not want ıp " with many stems.

best to lift all the stronger-growing every autumn or spring and replant strongest outside shoots, discarding lle of the plant; by so doing they are gorous and healthy, and free from

up is of great importance. Use a take for each stem. This should be rly in the summer when they are r 2 feet high, before the side sprays eloped. In this way the stakes will n.

ll the room between each plant that ble, anything up to 3 feet apart. sharp look-out for slugs, especially st planted.

Michaelmas Daisies are swamp hey are moisture lovers, therefore if plant in a damp situation.

They will grow almost anywhere, but prefer a stiff loam or even clay. If, however, only a hot, dry situation is available much may be done by giving the plants a spring mulching of long manure, or anything (mowing grass) that will help to retain moisture and keep the roots cool during the summer. In dry times they will benefit by a thorough soaking of water, but it is not necessary.

The ownership of dogs

A threefold responsibility

KEEPING a dog entails a threefold responsibility—the responsibility of the owner to himself, to his dog, and to the neighbours, using the term in its widest application. Civilisation has become so complex, and this little island of ours so crowded, that few of our hobbies or sports can be pursued without bringing us into contact with others. Good feeling dictates that nothing should be done of our own volition to cause annoyance. The unwritten laws regulating intercourse with our fellows must be observed as well as those that are embodied in Acts of Parliament.

The law gives certain privileges to dogs as well as imposes obligations upon their owners. They are not trespassers in the streets or upon the highways, and damages may be given against the driver of a vehicle who kills or injures one if, by the exercise of due care, he could have avoided doing so. Dogs that do damage to cattle or poultry or merely chase sheep may be expensive possessions, and they have no right to wander upon the premises of a neighbour, though his fences may not be in good repair. Nor are they allowed to bark incessantly to the annoyance of other residents. In some towns it is an offence to defile the pavements.

The risk of transgressing, however, can easily be reduced to a minimum by the exercise of a little forethought and consideration on the part of their owners.

So far as the responsibility of the owner to himself is concerned, it consists mainly in seeing that his dog is so trained as to become a desirable companion and a decent member of the household. He will be fully compensated for his trouble by the service and devotion that he will receive in return.

The dog is so useful to man that the least he has a right to expect is that he should be comfortably housed, fed adequately upon suitable fare, exercised daily, kept in cleanly condition, tended when he is ailing, and admitted to a share in our friendship. Perhaps the last claim is of first importance, for kindly treatment means much to a dog, who is as capable of experiencing joy and sorrow as human beings are. The happy dog is usually a healthy dog, and we shall be amply repaid for any little trouble we may take in ensuring his contentment.

During National Dog Week, which began on the 22nd of this month, efforts are being made to show how this threefold responsibility can be honoured without the imposition of irksome obligations. The Central Council, of which the Earl of Chesterfield, K.G., is President, in desiring to improve the condition of dogs generally, preaches nothing that cannot be put into action easily. Literature of an informative nature will be supplied for distribution on application to Captain H. E. Hobbs, 37-38, Temple Chambers, Temple Avenue, E.C. 4. A. CROXTON SMITH.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FRUIT

Cordon Apples

My cordon Apple trees, both vertical and horizontal, have got too long in the branches, owing to a little more being left on each pruning time, as is usual with pruning, so that they have almost ceased to be cordons. Will it do to cut them right back to the central stem at the right time, losing one season's fruit, of course?

ERNEST LINGFORD.

[Yes, you can trim back the branches of your cordon Apples, but not quite to the main stems. Rather leave from ½ inch to 1 inch, and this will ensure a more regular and certain production of fresh growth. This work can be carried out any time after the leaves drop until just before the sap begins to rise again.]

Apple and Pear specimens

(Hon. Lady Mahon).—We have examined the specimens sent and find that they are affected as follows:—Apple var. Lord Grosvenor—Leaf Scorch and Apple Scab. Apple var. Peasgood's Nonsuch—Apple Scab. Apple var. Peasgood's Nonsuch (cracked specimen)—Apple Scab. Apple var. James Grieve—Apple Scab. Pear var. Louise Bonne of Jersey—Pear Scab. Pear var. Williams' Bon Chretien—Pear Scab and insect attack. Pear var. Bergamont d'Esperan—Pear Scab. You will notice that in the main your troubles are confined to Apple and Pear Scab. The controls for these diseases have been frequently given during the last six weeks in our Answers to Queries columns. Please look up back numbers for details. Apple and Pear Scab cause very varied appearances of the attacked fruits according to the age of the fruit when attacked. This accounts for the different appearance of the fruits sent, but Apple and Pear Scab respectively is the organism concerned. The Leaf Scorch can be cleared up gradually by applying sulphate of potash at the rate of 1 oz. per square yard each autumn for several years in succession. The insect attack on the Pear was probably Capsid Bug or Aphis. A good nicotine wash applied soon after the petals have dropped from the flowers would control the trouble. All the trees should be washed with tar oil in January. Write again if we can assist you further.

Apple questions

(L. W., Worcester).—(1) Your Apple wood is affected with Apple Scab, and you should adopt control measures as suggested to "E. H. K." on page 616 of our issue for September 7th. In your case we should advise you to cut back to about one-third of their length all the leaders. The laterals might be left about four buds long. All the prunings should be burnt. Carry out the spraying programme suggested to "E. H. K." In addition we advise you to give a dressing of sulphate of potash at the rate of 1 oz. per square yard. (2) The insects attacking the Apples are Codlin Moth. Most of the caterpillars will now have gone into winter quarters so that the placing in position of haybands to encourage the larvæ to spend the winter will not be of much use. Such bands should be placed in position another season in June and burnt in October. Codlin Moth larvæ get into crevices of the bark and eat out depressions for themselves and then cover themselves over with a cocoon which looks very similar to the bark, so that when removing the hayband it is necessary to scrape the bark beneath the band with an old knife and destroy the caterpillars found. You should use a good tar oil wash at 10 per cent. about the first week in January. If the trees are old the loose bark should be removed before the tar oil is applied. Spraying with lead arsenate during the week following the dropping of the petals from the flowers is useful in controlling Codlin Moth. If applied later it is useless. Effort should be made to drive the spray into the calyx cup.

Myrobalan Plum

The red Plum-like fruits are fairly plentiful this year. This is Prunus cerasifera of botanists, known as Roblets in the Midlands

Diseased Peaches

(H. Rothery).—We have exami specimen Peaches and there is no dis sent; a cultural detail is at fault. T probable cause is that the feeding balanced. In addition to your usual r give the trees a dressing of sulphate o at the rate of 1½ ozs. per square yard attention should be paid to watering the trees are under glass, ventilatio think that the trees are over-vigoro the potash should in time put things

Black Currant

(M. A. M.).—The Black Currant Davidson's Eight is on the market, been for several years, and can be c from most nurserymen who list frui Consult our advertisement columns ar for prices to the various firms who sp in hardy fruit.

Peach foliage

(L. I. D.).—Two creatures are pre the specimens, either of which is in s number to cause you trouble. Red has been playing havoc with the Please see reply to " Bert " on page our issue for September 7th. The pest present is the Brown Scale (Le persicæ). The spray for Red Spid partially control the Scale, but this sh supplemented by using lime sulphur the winter. Collect and burn all the when it falls. After the tree is prun all the parts of the tree a good sc where such treatment will not dam buds, then spray the tree all over solution made by taking 10 gallons o and adding 3 quarts of concentrated li phur. You have a bad attack of thes and it will take some effort to get th back to health.

Plum Rust

(Beacon).—Your Plums are affecte the fungus Puccinia Pruni, which Plum Rust. Give the affected t thorough spraying with lime sulphur As the leaves fall collect and burn the peat the spraying operation several tim season, commencing just as the buds to push out, repeating at intervals o three weeks. After the first applicati a very dilute solution 1—100, *i.e.*, 1 concentrated wash added to 99 gall water. Give the trees a dressing of s of potash at the rate of 1 oz. per squar Water it in if the trees are very dry.

Cherry foliage

(A. D. Buller).—We have examin foliage sent, and the main portion damage appears to us to have been ca a leaf-eating insect, probably the coloured Weevil. If this finding is the adults have now ceased feeding season, but the larvæ are feeding in t upon the roots of the tree. If the growing in cultivated ground a dress flake naphthalene should account for m the larvæ. A grease-band put on the stem in May would prevent the getting up the tree. Please see reply Taylor in this issue *re* Strawberry gru hayband placed around the trees wo your case act as a trap. If you exami band several times each week you sho able to catch some of the culprits. T a trace of Shot Hole fungus on some leaves, but it does not appear serious. trouble is repeated next year please s some specimens earlier in the season.

Strawberry grubs

(S. Taylor).—The specimen grub that of the Clay-coloured Weevil. Th is difficult to control, and plants are da by both the larvæ and adult stage of t

\. Apply flake naphthalene at the rate ozs. per square yard. Fork in the ial near to the plants and as deep as le without actually damaging the roots. ring, when the adults emerge for egg- , traps should be laid down and those ed at the trap should be destroyed. A ul of hay laid down near to the weevil s makes a good trap.

pillar attack

Barron).—The specimen Apple and foliage has been badly attacked by illar, probably Winter Moth. The trees l be grease-banded about the first week tober. Follow this by giving the trees ough spraying the last week in January good tar oil wash, using a 10 per cent. on for the Apples and a 5 per cent. solu- or the Plums. Watch for caterpillar when the buds break next spring, and find they are present in any number the trees with an insecticide. We that there is some Apple Scab present could be controlled by following the ons given to " E. H. K." on page 616 issue for September 7th. If you added rsenate to the first spray fluid for Scab ould control any caterpillar present.

ROSE GARDEN

sed Roses

se).—Examination of the specimen shows that they are affected with a canker. Both are affected with the disease. It appears that the attack l at the point of union between stock ion, and the trouble has gradually de- d. The fungus has completely circled em, and we think that the plants will on for some years before dying out her. All the badly infected plants be burned. Those not so badly at- might be saved by cutting out the d portions, but if all are like those here seems very little hope for them, e the whole of the stem just above the seems to be affected. A good soaking Cheshunt Compound in spring might ou.

FLOWER GARDEN

for exhibition

J. Hastings).—To be certain of a sufficient number of blooms at set time you would require to many more varieties than are really ary if you wished to set up distinct es and not less than three plants of Of course, as you can, seemingly, one variety, the number of varieties ow need not exceed about six. ng competition, however, the exhibit the greatest variety, if the blooms ood, should certainly score. The fol- are all good and distinct :—Mrs. Wm. son, Mrs. T. D. Anderson, Jean Helen W. Cochrane, Betty White- Peggy Trail, Moseley Ideal, Andrew on, Mr. Ramsay, John Adamson, en Condry, Madge McKnight, Mrs. Stevenson, Mrs. McEwan, Mrs. H. , Rowan Hood, Mollie Gibb, and Jumbo. Any Viola specialist, even if s not list all the above, will procure r any other variety in commerce for The culture of these plants would re- oo much space for insertion in this out we hope to have a special article subject in the course of a few weeks.

mal Heleniums

J. O.).—We have carefully examined cimens of abnormal Heleniums which ed you to send, and are convinced e injury has been caused by insect probably Thrips, or a mite of some description, but we have failed to find any specimens. The injury was undoubtedly done at a much earlier period, and the creatures responsible have now left the plants. There is certainly no need to destroy the plants. Why not give the soil a good dressing with a soil insecticide, and then, when the plants are developing next year, an occasional spray with a very weak solution of liver of sulphur? We should like to examine some more flower buds next season just as they are developing. The suggested treatment may cure the abnormal habit, but we should have liked to have found the actual creature concerned; we should then have been sure of the track to take; as it is, we are shooting in the dark. We are glad you find GARDENING ILLUSTRATED interesting and useful.

Diseased Asters

(Donegal, E. W., Hereford, and G. T. B. B.).—Some of the above correspondents sent specimens which are insufficient to determine the real cause of the trouble because the fungus has attacked the plants at or just above the soil level and tips of growths only were sent. Judging from the three letters, the cause of the trouble is a Foot Rot. The only control is to take up affected plants and burn them. If soil sterilisation is deemed necessary, the instructions given to " Beauty Lover " should be followed. All should try a dressing of sulphate of potash this winter at the rate of 1 oz. per square yard.

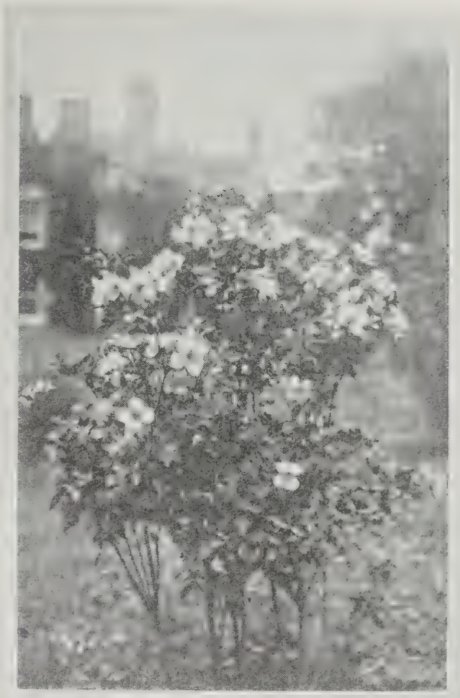
Diseased Lupin

(Mrs. G. Gibbs).—From the specimen sent it is impossible to say the exact cause of the death of your Lupin. If the plant had been sent earlier we might have isolated the organism concerned; now the whole plant has dried up, and incubation does not reveal anything but Saprophyte Fungi. From the appearance of the specimen, it has probably been attacked by a Foot Rot fungus. It would be wise to destroy the diseased plants; other plants might be planted next spring if the sites are watered with Cheshunt Compound before the new plants are put out. Lupins do well on good garden soil, good drainage being essential. Of late years Lupins seem to be troubled by Foot Rot and Eelworm attack. Burning the affected plants and sterilising the soil seem to be the only cure. We are inclined to think that the increase of disease amongst flowering plants is due to the use of unbalanced manures, especially lack of potash. Plants receiving too much nitrogen produce soft growth, which fall a ready prey to disease organism.

Diseased Daffodils

(Donegal).—The specimen bulbs sent have been attacked by the large Narcissus Fly. If you cut open the attacked bulbs you will find the large, fat grubs in the centre; at least we found one in each of the specimens sent. Before replanting, carefully examine the bulbs and destroy all those found to be affected. Damaged basal rings are sure signs of the presence of the pest. The grubs can be killed within the affected bulbs by immersing the bulbs in hot water for a period of 60 minutes; the temperature of the water should be 110 deg. Fah. No damage is done to the bulbs if they are ripened off and treated in July, August, and September. Earth up the ripening bulbs as the foliage begins to die now. Another year this treatment tends to prevent the flies crawling down to the bulbs for the purpose of egg laying.

Diseased Stocks



Eucryphia pinnatifolia flowering in a Ross-shire garden

(See page 652)

I shall be so much obliged if you will kindly give me an answer about my Ten-week Stocks. I enclose a plant for you to see the roots. I had them planted out in May in the front of a Rose border that faces south. They grow well for some time, and then suddenly begin to droop one after another when they are fine plants just coming into flower; also when they are in flower, and so on through the summer. I had over 100 plants put out in this border in May and by the end of July they had all gone off in this way but 30 plants, and now these have gone, and there are just four plants left which are still flowering. It has nothing to do with a dry or wet summer, they just go the same whichever it is. I have been told it is a fungus in the soil, and was advised to lime it last autumn and sprinkle the soil a fortnight before planting the Stocks in May with Bordeaux Mixture (½ oz. to a square yard), both of which I did, but it has done no good at all. The year before, autumn 1927, I watered the ground with formalin, but this also did no good. I hope you will be able to tell me exactly what to do to cure it as I want to treat the ground at once, and, if possible, to plant Poppy Anemones there some time in October. Some of these often go off, and perhaps it is the same thing that causes them to do so. What do you think about it? I do not mind what trouble I take if I can cure it. I love to have the Stocks in this border, as it runs beside our tennis court, and we love the scent of them when we are playing. I hope you will be able to tell me of something that will really stop the trouble and be a cure.

" BEAUTY LOVER."

[Your Stocks are affected with one of the Foot Rot Fungi. From your letter it would appear that the border is badly affected with the fungus. Partial sterilisation of the soil can be carried out by using a 2 per cent. solution of formaldehyde. The success of this treatment depends to a large extent upon the thoroughness of the operation. First of all, the solution must be made up correctly; secondly, all the soil must be thoroughly well soaked with the solution; and, thirdly, the treated soil should be covered to keep the fumes in for at least 48 hours. The operation is carried out as follows:—Clear all plants out of the border and fork the soil over to a uniform depth, breaking up the lumps as the work proceeds. Measure up the area to be treated, and for each 18 square yards take 1 gallon of commercial 40 per cent. formaldehyde and add to 49 gallons of water, stirring well. The formaldehyde should be a fresh sample, and should not be cloudy. If the sample is cloudy some of the chemical is out of solution through standing; such samples are usually unsatisfactory. After the solution has been applied, the treated soil should be covered with a tarpaulin or clean sacking to retain the vapours, such covering to be left in position for 48 hours. Plants should not be placed in a treated bed for at least a week, and during this period it is wise to turn over the soil at least twice to help the fumes out of the soil. If there is no need to hurry the planting of the next crop, it is an advantage to allow the formaldehyde fumes to remain in the soil as long as possible. Planting is safe a month after the sterilisation operation in open ground. After sterilisation it is important that care be taken not to introduce disease organisms. When raising your Stocks next year the seed boxes and soil used should be treated with formaldehyde; soil used for pricking out the seedlings should be well watered with a solution of Cheshunt Compound and allowed to drain before risking the seedlings. When the Stocks are in their flowering quarters a sharp look-out should be kept for signs of disease. At the first sign of disease the plant should be lifted and burnt. The site from which the diseased plant was taken should receive a soaking with Cheshunt Compound solution and another plant from the reserve garden can then be put into the position. Plants growing near the affected plant are safer if watered with the Cheshunt solution. We hope the above makes quite clear that formaldehyde solution must only be used on vacant ground, but that Cheshunt Compound solution can be used on growing plants. The above treatment is costly and troublesome, but if carefully carried out should have the desired result. Seed boxes and soil used for filling the seed boxes should be treated six weeks prior to seed sowing.]

Begonia foliage

(D. M. C.).—From the specimens sent it is impossible to say with any degree of certainty the cause of the trouble. We cannot find a fungus that would be likely to cause the trouble, and we are inclined to think that some root failure is the cause of the trouble. If you have only one plant affected it would be wise to burn it. Some cultural detail may be at fault, but from the evidence we have we are helpless; the leaves dried very badly in the post.

GREENHOUSE

Hedychium Gardnerianum

In your September 7th issue you have a very fine illustration of Hedychium Gardnerianum. For a number of years I have grown this plant and always have had some blossom, but for the last two or three years I have not had a bloom in either pot. I usually have at least two or three good stems in each pot. The position and treatment have not been changed; in a cold greenhouse, repotted last year in the hope it might produce blossom.

MRS. E. J. PAINE.

[This fine subject requires more warmth than is available in a cold greenhouse. A temperature of 50 degs. to 55 degs. in winter and a rather sparing supply of water will afford the plant the necessary rest period. In summer a moist atmosphere with a night temperature of 60 degs., rising to 85 degs. in the daytime, is desirable, while plenty of water at the roots is required. The best compost is loam and peat in about equal proportions with some sand and dried cow manure.]

ALPINES

Rock garden Caterpillars

(W. E. Pattman, Warwickshire).—The specimens you send are those of one of the so-called Cutworms. As they appear to "enjoy" naphthalene try them with the poison bait suggested to "Meiktila" *re* Cabbage Caterpillar, on page 572 of our issue for August 17th. Under small conditions, searching the soil surrounding an attacked plant is a good method of reducing attack. The caterpillars hide by day, but are never more than an inch down, and usually much less. A pointed stick is the best tool to use. The poison bait is the best method if your conditions will allow you to use it.

TREES AND SHRUBS

Shrubs to form slight screen at back of border

What can you suggest to make a slight screen against wind along the back of a border 15 feet by 7 feet facing S.W. in a small Devon garden? Shrubs, chiefly evergreen, that are choice and have bloom, if possible. Near the sea on a hill exposed to our S.W. gales. Would Pyrus japonica, white and pink, do for some of the plants, also Myrtles? H. B. C.

[Either of the following would answer your purpose:—Myrtus Luma, Escallonia macrantha, E. rubra, E. langleyensis, Olearia Haastii, Berberis stenophylla, B. Darwini, Baccharis patagonica, and Atriplex Halimus. It is possible that the Pyrus would thrive also, but this is not evergreen.]

VEGETABLES

Tomato trouble

(G. P. B.).—Your Tomatoes not colouring is due to insufficiency of potash in the soil and manures used for the crop. It is now rather late in the season to control matters, but you might try a good soaking with a solution containing 4 ozs. of sulphate of potash in 25 gallons of water. Another year add sulphate of potash at the rate of 1 oz. per square yard when making up the bed. Follow this by giving a thorough soaking when the third truss is set, using the solution suggested above.

MISCELLANEOUS

Grassland problem

We had a 40-acre field sown down with permanent Grass four years ago, and this year practically all the Clover has gone. There are many plants, a sample of which we have sent you under separate cover, representing possibly 250-300 per acre. The crop was got early in July and the plants have shot up again to at least 2 feet high. This is the first year we have been troubled with them, and, subject to your advising me, I propose to drag up the field again and sow it with Corn, as I do not think a crop of Rye Grass mixture would be either useable or saleable with such a tremendous percentage of this stuff. Further, I should be glad to know whether you consider there would be an increase in quantity or whether it is only a temporary crop. W. B.

[You would have helped us considerably if you had told us the type of soil in your field. In the first place, the weed you send us is common Chicory, or Wild Endive (Cichorium Intybus). The weed is a native of Britain and a perennial. From the information we have it is impossible to state how the weed has become established, but it appears likely that it was present in the soil before down; but it may have been introduced seed mixture. We should advise you t the field alone for the time being, plo out would only tend to divide up the and propagate them. So soon as the comes soft enough go over the field and pull the Chicory. If the ground is rea you should be able to ensure the rem that little is left behind to grow again Chicory will be liable to increase something is done to control it. Th appearance of the Clover is not unus some fields, and in your case we do no that the weeds have had anything to d the failure. Try an equal mixture of and good-grade basic slag. Mix th thoroughly together and apply at once rate of 8 cwts. to 10 cwts. per acre. rain to wash in the mixture before t any stock into the field. We think t hand-pulling the weeds and applyin above manures you should be able to p field round without breaking up, but w not say definitely without actual exami of the field.]

"HARCO"
Rubbish Destructor

The quickest and easiest method of dealing with refuse is by means of the "HARCO" Rubbish Destructor. It will burn any kind of refuse and keep your garden free from diseased plants and vermin.

Soundly constructed of heavy mild steel plate, the "HARCO" Rubbish Destructor will withstand the roughest usage and outlast several cheap and inefficient destructors. There are no cast parts to break, and a steel tray is provided for the collection of Potash—a valuable plant food.

Rose & Fruit Tree Specialists

How do you buy
***your* BONEMEAL?**

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter. Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

A free sample will convince you. Write for it to-day.

GARDENING ILLUSTRATED
Service Bureau

⊙ ⊙

¶ "GARDENING ILLUSTRATED" aspires to be more than a weekly record of horticulture. It realises that each gardener has individual difficulties needing immediate expert attention. Through its "Answers to Queries" the best advice obtainable is given.

¶ Readers wishing plants or fruit named should send fair examples of each—stem, leaf, flower, or fruit.

¶ Considerable care, over a number of years, has been given to tabulating information on the sources of supply of horticultural goods. We are pleased to give information as to where various items are obtainable.

¶ The Publisher will be glad to send specimen copies to any part of the world calling attention to any article or note which would specially interest gardening friends of readers.

A BURNING QUESTION
Do not burn your garden refuse; it is wasteful. Ensure a supply of excellent organic manure by treating lawn mowings, leaves, weeds, and general vegetable refuse with ADCO. Results prove that Synthetic Farmyard Manure made by the ADCO PROCESS is the most effective substitute for animal dung. The manure shortage is a serious question, but
ADCO WILL ANSWER IT
ADCO and water added to refuse as it accumulates will produce a rich clean manure in from two to six months; thousands of tons are made annually by gardeners, farmers, fruit growers, nurserymen, schools, and institutions.
One cwt. of ADCO makes 2 to 3 Tons of Manure

Plants of the Antipodes

WHEN the discoverers of Australia came home and described the black swans, the hedgehogs that laid eggs, e Ferns that grew into trees to an ice that "had heard that kind of thing" they must have felt a little exas- with a Continent that carried ness too far for the credit of simple, ing men. But these travellers' tales urprisingly proved to be true, and it at first as though the old philosophers, oretold that a certain urviness would be in the undiscovered les, were not very far A closer acquaintance he plants and animals new country failed, r, to reveal anything iting as a systematic of the Northern f things; yet there re- for the observer from World, a strangeness plants and animals of tipodes which is more han mere unfamiliarity, ems to depend upon hat so many of them what they seem to be.

NEW ZEALAND VERONI- characteristic example deceptiveness is fur- by the New Zealand cas, some of which look exactly like Club until their scaly rat- erupt little Bird's-eye which proclaim them close akin to our own r Speedwells. Others le Stonecrop or a tuft of Heather, while them, Veronica cupres- gives a very successful n of a small Cypress, a pyramidal bush feet high, which can be mistaken in the for a young Conifer, especially since off a sweet scent of Cedar wood when et with rain or dew. And then in ummer it is suddenly sprinkled with avender flowers and its identity is re- Two plants are found in gardens the name V. cupressoides; one is yellowish, and without scent, while er, which is the better garden plant, believe, the rightful owner of the s larger, greyish, and sweetly scented. nately, the names of these New Zea- ronicas are at present rather confused, e botanists, to whom an engaging habit of mimicry does not greatly appeal, propose to divorce them from the Speedwells and put them in a group by themselves under the name "Hebe," there to await rearrangement. But nearly all of them are worth growing, under whatever names they appear, and V. cupressoides is specially recommendable for the small garden or for a position where its slightly formal design is desirable.

Veronica cupressoides, a successful imitation of a small Cypress

The leaves give off a sweet scent of Cedar wood, especially on dewy evenings or after a shower

COMPOSITÆ IN THE ANTIPODES.—The great and wide-spread race of Compositæ has given us some good garden plants, but it is not, as a rule, distinguished for refinement. In the Antipodes, however, the family seems to lose that tendency to a rather coarse heartiness, which is almost characteristic of it elsewhere, and at first sight is barely recognisable in its new mood.

Tasmania gives us what is probably the smallest Composite in the world in Raoulia subsericea, which has reduced and compressed its leaves until it looks more like a thin crust of wrinkled grey Lichen than a flowering plant; its flowers, indeed, are no more than minute brass buttons studding a mat of tarnished silver. Its slightly larger and more silvery relative, Raoulia australis, is well known in rock gardens, but the delicate felting of fine hair with which these plants cover themselves is a better protection against the droughts of the far south than against the rains of our sodden winters, when they need a pane of glass to ensure their life, or at least their beauty.

One of the Raoulias mounds itself up into large grey hummocks, which at a distance look very like sheep and have been known to mislead shepherds searching for strays from the flock, and on this account it is said to be called the Sheep Plant, though it seems unlikely that a deluded stock-rider would address it so mildly.

Even the Groundsels acquire a strange refinement in New Zealand, where Senecio Greyi so far forgets the dreadful dowdiness of its family that it grows into a woody shrub, with neat, oval leaves, grey above and dead white beneath. In its flowers it falls a little short of its promise, for a hint of brassiness in their yellow reminds us of the family weakness; but they are relieved by the Quakerish simplicity of their background, and Senecio Greyi is a desirable shrub in any garden.

The Celmisias, on the other hand, tend to become almost over-refined, and some of them achieve only an effect of colourlessness. Many of them, however, are very admirable; forming tufts of stiff, silvery leaves like a small Yucca, from which rise straight stems, each carrying a single, large white Daisy, cold, austere, and conventional.

AN ANTIPODEAN GARDEN.—Many of the plants from Australia and New Zealand do not make themselves at home very readily in our climate (a reluctance that is, unfortunately, not displayed by English plants in New Zealand, where Gorse and Blackberry have become as devastating as the rabbit in Australia). But enough of them are sufficiently hardy and easy to provide a group, which, without appearing academic, will bring out the subtle strangeness that is common to them all. It might include V. cupressoides, with some of its smaller relatives, such as V. pinguifolia, V. lycopodioides, or

V. buxifolia, Senecio Greyi, Celmisia coriacea (for a warm spot), one or two of the Daisy Bushes (Olearia), and we might add the curious shrub Hymenanthera crassifolia, a rather sullen-looking evergreen which claims attention on account of its piebald berries and its unexpected relationship to our Violets and Pansies. F. A. HAMPTON.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Ranunculus Lyallii in Northumberland

I WISH I could give your correspondent, "Peter the Hermit," the clear directions he asks for (page 649) as to the growing of Ranunculus Lyallii in this country. All I can say is that it has done well here in Northumberland, at 500 feet above sea level, in a bed which for about 1 foot in depth is largely composed of leaf-mould and peat, and which gets the sun nearly all day long, but is rather moist and has a gentle slope towards the north. To further indicate the nature of the soil and the position, Gentiana sino-ornata, Trientalis europæa, and Erica tetralix are also doing well in this bed.

This year one head of Ranunculus Lyallii had 17 of its lovely blooms—pure white petals surrounding a central cone of pale yellow stamens and stigmas—held on a stout stalk well above its rounded cup-shaped leaves. As each flower was about 2½ inches across, it stood out as a queen among the Buttercups in its regal splendour.

I have a fair supply of fresh seed and I am quite willing to more than "threaten" your correspondent with some of this in return for some seed of one of his treasures.

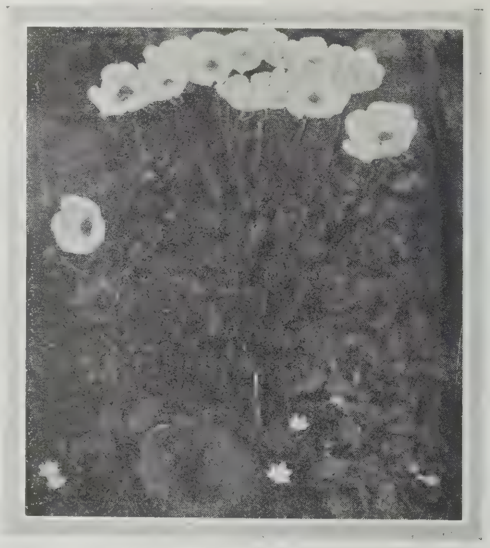
NORTHUMBRIAN.

Iris Amber Wave

Mrs. Murrell's note on her Iris seedling, Amber Wave, in GARDENING ILLUSTRATED of September 14th, is of great interest in showing both the potentialities of Iris breeding and the unexpectedness of many results, especially when the ancestry of the parents is unknown, or only partially known. I do not know the parentage of Shekinah, but from flowers I have raised I should guess that it came from a cross of a special Pallida variety or a Plicata with a self-yellow, such as Aurea or Mrs. Neubronner. The ancestry of the sister seedling of Mrs. Valerie West, which Mrs. Murrell used, includes Macrantha, Cordelia, Leonidas (a Pallida variety), Maori King, and Cypriana (Trojana). Two concurrent strains of two generations each were raised and then combined. I have not seen the flower of Amber Wave, but the very excellent illustration and Mrs. Murrell's colour description enable one to have a satisfying mental picture of it. The form of the flower is very fine, and no doubt has come largely from Dominion (= Macrantha × Cordelia), which was in the parentage of both sides of the cross from which Mrs. V. West came, and it is especially interesting to see how Macrantha still shows clearly in Amber Wave, chiefly in the form and serrated edges of the standards, though combined with so many other varieties.

My results in using Shekinah in breeding are quite in accord with Mrs. Murrell's, that is, in the great preponderance of self-yellow, or nearly self-yellow, or cream seedlings which appear. In the largest set of seedlings from a Shekinah cross (27 from one pod of seed) the flowers were all self-yellow, of varying degree, except four or five blue-violet Neglectas of Corrida type. Another noticeable characteristic of Shekinah seedlings when of the self-yellow type is a tendency for the standards to be deeper-coloured than the falls. These results were certainly unexpected and seemed extraordinary at first, but they are, perhaps, less surprising when we consider the relationships, which we now know, between Amœnas and Variegatas, and between Neglectas and Squalens. Amœnas are only colour varieties of Variegata in which the factor for yellow is absent or inhibited. Likewise for Neglectas and Squalens, the factor for yellow being present in Squalens and absent in Neglecta.

The full account of the crosses supporting these conclusions were given originally in the R.H.S. Journal, Vol. XLV., Parts 2 and 3, and in the "Gardeners' Chronicle" for February 14th, 1920. When, further, the purple in the falls is absent or inhibited, a Squalens becomes a "self-yellow," a cross of a Plicata with a self-cream Variegata-Squalens of Innocenza type produced from the same seed-pod blue-violet selfs (or Neglectas), amber-yellow selfs, and Squalens. It seems, therefore, a likely inference that the "self-yellow" of Shekinah is due rather to an inhibiting factor or factors for purple rather than to an absence of a purple colour factor. This would also account for there often being some tinge of colour at the hafts and in the reticulations in many of the seedlings, the inhibiting factor not being strong enough to entirely eliminate the purple of very deep-coloured flowers. A. J. BLISS.



Ranunculus Lyallii in Northumberland, 1929

The small white flowers in foreground are those of Trientalis europæa

The National Carnation and Picotee Society

I am sorry if the truth contained in my original communication has roused the ire of the Hon. Treasurer of the Northern Carnation Society, but I have not the time, intention, or desire to enter into acrimonious correspondence on the subject. The down to date facts, which I am more concerned with than out-of-date history, were given in my letter, and these are amply confirmed by the records of the National Carnation and Picotee Society in my possession, also by details given in the various horticultural directories. If further confirmation is
and I doubt whether it is, I would em
the fact that the Northern Carnation
is affiliated to the N.C.P.S., that it p
ordinary annual fee for this purpose,
entered in our records under the
N.C.S. Such an affiliation would
necessary if it was part of the N.C.P.

I would remind Mr. Hewitt that th
been no break in the continuity
Society's activities during recent
whilst his own became defunct duri
war, and the present organisation (N
Carnation Society) was only really re-
a few years since.

Mr. Hewitt has evidently had no
ence in the organisation of a National
society if he thinks such a body cann
more advantages than an ordinary a
society, and I would point out th
N.C.P.S. has held exhibitions in th
vinces, and will do so again, in a
manner to other National flower socie

For Mr. Hewitt's information
N.C.P.S. pays ordinary rates for its
tisements, and is not out for cheap p
as he surmises, neither has it any in
of spending money for announceme
order that the membership roll

matter, the correspondence must n
considered closed. A. E. A

Hedychium Gardnerianum

In the note in last week's is
GARDENING ILLUSTRATED, in reply
inquiry as to this plant, it is stated
requires a winter temperature of fr
degs. to 55 degs. I think there is
apprehension as to the hardiness
plant. In South Devon and Corn
grows well in the open without wint
tection and flowers freely every year i
tember. Here I grow it in a small be
Richardia africana (the common Arun
where it can be kept moist in summe
the overflow from a pond, and no pro
whatever is given. The combination
two plants is an excellent one, as the
attractive either in foliage or flower
throughout the year, as before the foli
the Arum dies off the Hedychium com
Last winter we had 5 degs. of frost
nights, which, of course, cut the
of the Arums; these, however, so
covered. The Hedychium, which wa
mant, was quite unharmed, and bl
freely last month. C.

South Devon.

To protect special fruit from the ra of birds and insects

Various methods have been adopted t
fruit from the attacks, and consequen
by birds and insects, but each plan ev
has its drawbacks, for whatever prec
is taken, much valuable fruit is spoil
year just as it is at the ripening stage.
ing tried many plans in the past witho
appreciable success, the following
operandi has, from my personal exp
and close observation, this year prove
efficacious and has been absolutely s
ful. My present scheme is the use of
phane, which is the thin transparent m
largely used by confectioners for co
sweets and cakes, and it is generally
as an outer covering for chocolate boxe

It should be formed in the shape of a
shade, just large enough to conveniently

fruit, and it should be fastened on, by a l portion of fine wire or a thin strand of , just at the junction of the fruit to the ch and left open at the bottom to admit e current of air.

plies and Pears thus protected get the enefit of the sun's rays without any per- ble heat, and this substance is not rially affected by dampness. Cellophane e obtained from wholesale purveyors to ctioners at the moderate cost of about er large sheet, and it can, with care, be over and over again.

course, the utility of this method is practicable in the case of fruit grown e cordon system, or on espaliers; also all fruit. F. CORY.

est *Worthing.*

Eucryphia pinnatifolia

planting choice trees or shrubs there is uch need for foresight in respect of their timate dimensions in order that each have ample room for development. e who are not yet familiar with the re- ments in that respect of Eucryphia pin- olia may chance to be misled by the graph of a young specimen of this ning shrub, on page 669, into thinking it requires but moderate space. In fact, soil and climate are to its liking, it s to very ample height and breadth. I se a photograph of one planted here t 20 years ago at a distance of 12 feet its fellow countryman, Tricuspidaria olata, which may be seen in the left r of the photograph, fighting for room the Eucryphia.

ododendrons stand transplanting at st any age, owing to their compact root m, but Eucryphia is very impatient of val once it has become established. In Bean's admirable book on "Trees and bs," first published in 1914, he observes "unfortunately, although hardy, yphia is not easy to propagate or trans- "; but the difficulty of propagation has been overcome, as both this species and ordifolia when mature produce seed lantly. It is remarkable that about 20 ent. of the seedlings of E. pinnatifolia double flowers, wherein much of the iar grace of the single flowers is lost, e double flowers last much longer than ingle, and their effect on a well-grown is very satisfying.

nreith. HERBERT MAXWELL.

Lilium Harrisii

have been much interested to see the nces to Lilium Harrisii in two recent ers of your paper. With reference to ote on page 654 (issue September 21st), riter gave some bulbs in the autumn 27 to a friend, Mr. Donald Stewart, of oss Street, Finsbury, E.C. 2, and we a letter from him, dated October 19th, in which he writes :—

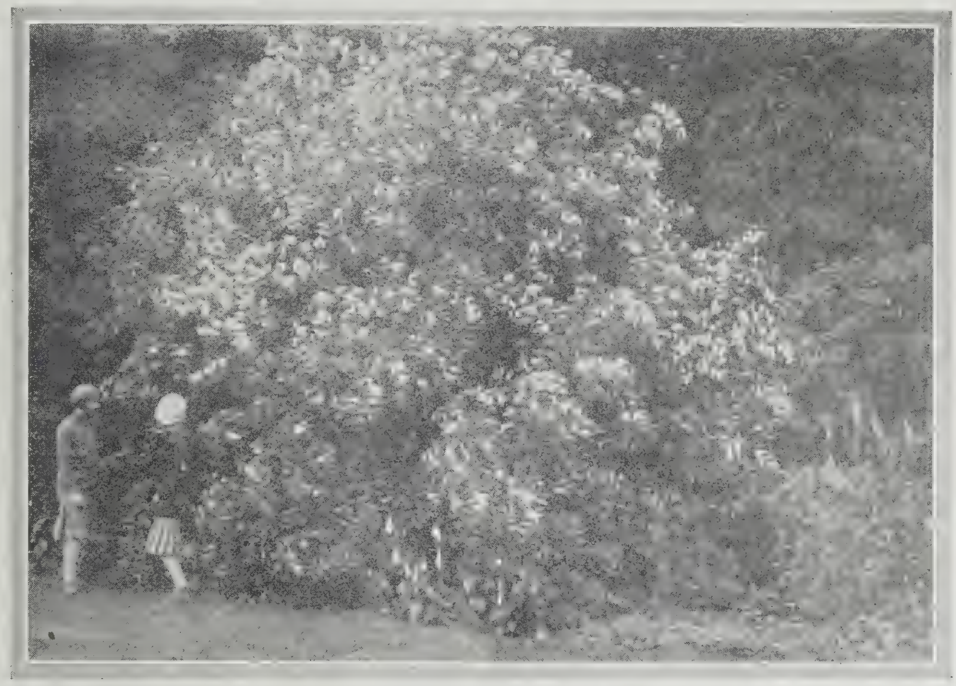
t may interest you to know that the uda Lily bulbs (Lilium Harrisii) which last year have proved a splendid lot, have had a succession of blooms from to present date, and even now have d show. The first shoots showed an ge of three blooms per head, and after I have had from each bulb a second "

Stewart goes on to say that the plants grown in an unheated greenhouse and d out in the open in May, and no al manure or other treatment was

agree with you that a second crop is likely to be obtained from plants which been grown at a natural temperature, hat it is not a matter which, in any nstances, can be controlled with certainty. The fact that the bulbs bear the Government certificate of freedom from disease has restored confidence amongst both the amateur and trade growers.

We look forward to the time when Lilium Harrisii will regain its old popularity.

ROBERT TUCKER AND CO.



Eucryphia pinnatifolia at Monreith

Making the garden "pay its way"

I regret that I was unable to assist "A. D. G. G." in his quest after a mechanical cultivator; but from the position I took up at the time I see no reason to resile. As his inquiry, and the resulting correspondence, evoked nothing of a practical description, I think it is fairly obvious that gardeners, as a whole, have not found anything which, for practical purposes and in the case of their limited area, will beat the spade. But "A. D. G. G.," in his most interesting note, raises a question which is also full of interest; and especially in these modern and utilitarian times—that is, the question of making the garden pay its way. I do not think—I may, indeed, say I am sure—that the average garden does pay its way—strictly as a garden. Labour, seeds, implements, manure, and all the various items required are vastly more expensive than they formerly were, and even then, as a commercial proposition, the expense of running a garden of even moderate size exceeded the actual commercial value of the produce. In these modern days £1000 per annum does not go far in the upkeep of a garden—fuel, where there is any great amount of glass, is not an insignificant item. I am aware that, in the case of old estates which, alas, have changed hands (not always for the better), the new proprietors consider, and perhaps not unjustly, that the garden should pay its way or, at least, show a certain percentage on the capital sum at which it is assessed. It cannot be done. A private garden, as such, cannot possibly at the end of the year show an exactly balanced account. Nor, generally speaking, is it expected to do so. In the not distant past it was customarily said that there were two departments of an estate which did not pay and which were not expected to pay. These were the "home farm" and the gardens. The former was the demesne of the laird—or, in England, the squire—in which he carried out his own ideas of cropping, breeding, and so forth. The latter was the province of the lady who, year by year, planned improvements, planted Roses, made herbaceous borders and rock gardens, experimented with Lily ponds, and, generally, proved to be a good customer to nurserymen and seedsmen. The vegetable quarters were, in a way, subordinated to, reputedly, more important things; and if the wall fruit was cherished the orchard was left to take, as one may style it, pot luck. Expense was not considered, within reasonable limits; and it may easily be inferred that, under the older régime, the garden was not a paying proposition. But, and here comes in my own personal point of view, while it was correct to state that the garden, as such, did not pay, it was almost always forgotten that, apart from strictly garden work, the gardener's staff was called upon to do innumerable other kinds of work, a fact which was usually overlooked. The keeping of avenues, the keeping of, not infrequently, a mile or two of walks, the keeping of pleasure grounds, of tennis courts, of croquet greens, of a cricket pitch, the mowing, twice a year at least, of rough grass, and the weekly or bi-weekly cutting of short grass with machines, the raking and collecting of fallen leaves, and many other items; all these were carried through by the garden staff. (I notice, too, that "A. D. G. G." mentions haymaking.) So that if the garden *qua* garden was a losing speculation, I humbly submit that the garden staff at least paid its way. Leave the production of vegetables, fruit, flowers, and pot plants for home consumption entirely out of the question—I have been told that in one modern "commercially-run private garden" these are credited to the garden at wholesale prices—yet those who desire to have a well-kept, or reasonably well-kept place, do get a good run for their money. It would be interesting to learn the views of others—of owners, such as "A. D. G. G.," as well as of my fellow craftsmen. And, in conclusion, may I venture to suggest most respectfully that those who attempt to run a private garden on commercial lines cannot, really, have any great pleasure in our gentle craft. This I beg that

" A. D. G. G. " will not misunderstand. I know, and I can appreciate his point of view—a most laudable one in these days when many who are fond of gardens and of gardening must, perforce, cut their coat according to the cloth at their disposal. I can only again express my regret that I was unable effectively to aid him.

A SCOTTISH GARDENER.

Cynoglossum amabile

DO many people grow Cynoglossum amabile, the Blue Hound's-tongue of China?

Our own English Hound's-tongue, with its dark chocolate flowers and mousy smell, compared with this lovely lady is as a nigger to an angel. In honour of her character and her birthplace, in my own mind I call her the Celestial Hound's-tongue, or, better still, let us say the Heavenly Hound's-tongue.

For the flowers are of heaven's own tint, a purer azure than Anchusa, deeper than Myosotis. The leaves are greyish-green, and, with the sweet blue of the flowers, make a delightfully soft harmony of colour. Those who do not know the plant must imagine much magnified Forget-me-nots set on branching stalks some 18 inches high, and they must further imagine a certain velvety quality of the leaves and stalks that add charm of texture to beauty of colouring.

First catalogued as a biennial, the Cynoglossum is now, I find, described as a hardy annual—and as a half-hardy, too. It is all three. Self-sown plants will often survive the hardest winters, but there is no reckoning upon them, and I myself find the surest way is to sow the seed early in boxes and plant out later, when the flowers will be at their best in August. A succession of it in bloom can easily be had all through the summer. There are several breadths of it in my garden, some coming in, others going over.

A. H. TULLOCH.

Irreconcilable Alpines

The remarks of your correspondent, " F. A. H.," on this subject (page 567) are of great interest. I have always had the opinion that the increased atmospheric pressure in lowland gardens over that which obtains in their native habitats is a primary reason for the failure of the " irreconcilables," since we can reproduce more or less successfully all the other conditions under which they grow, and yet something is lacking. But the last paragraph of the letter of " F. A. H." reminds me that many Alpines grow in the Arctic regions, and there they come down to sea-level, so that considerably discounts the pressure theory. That some Alpines are irreconcilable and not others does not vitiate it, since the habits and constitutions of all species differ. Moreover, there are some lowland species which are notoriously difficult to cultivate. It might be difficult, if not impossible, to carry out experiments on growing plants under reduced pressure, since any apparatus to produce it would necessarily exclude ventilation, which is very necessary for their health. Perhaps those who know M. Correvon's garden at Geneva can tell us whether he is more successful with plants from high altitudes than we are in British gardens, but I do not know to what altitude his garden reaches.

A. H. WOLLEY-DOD.

Identification of fruit

I should be very much obliged if you could draw the attention of the readers of your paper to the desirability of giving full information when fruits are sent in for naming or identification. We invariably ask, when sending in fruit, that the following regulations should be conformed with :—

Of fruits send at least three perfect specimens of a variety. Do not send until the fruits are mature, and then choose specimens representative of the particular variety. Avoid sending bruised, diseased, or abnormal fruits. Include with each variety a typical shoot with foliage. Number each variety, preferably in Roman figures, by marking the skin with a hard pencil, and keep a record of the tree from which it is gathered. Labels are often displaced during transit. Wrap each fruit in paper and pack it carefully and securely in wood-wool or similar material. Flimsy cardboard boxes are usually crushed in the post, while scented soap-boxes taint the fruit and obscure the characteristic flavour. Give all the information you can respecting the age of the trees and how they are grown, *e.g.*, indoors or out, as cordons, bushes, or standards, etc.

I think you will agree with me that if a little more care by inquirers was taken, not only this Society, but many other Societies or persons asked to name or identify fruit, would be very much facilitated.

Cynoglossum amabile

Royal Horticultural Society.
Vincent Square, Westminster, S.W. 1.

What is wrong with the modern Rose?

If as a novice in the art of Rose-growing I may presume to answer this question, I say nothing is wrong with the modern Rose. It is glorious, and affords me the greatest pleasure in all my endeavours to cultivate it successfully. Some of the modern Roses I consider more lovely than others, but all are beautiful. The point in your correspondent's letter which interests me most is the following passage :—" What is one to think when one buys six plants of a kind, five die, the sixth flourishes, all have the same soil, the same culture? " What I think is that there was only one good plant among the six, the other five being bad or indifferent. I have purchased many modern Roses, but the mortality among them has been practically nil. What, however, I have consta
perienced is, that if I buy six Rose
variety from any nursery of repute
three out of the six succeed better
others. Why this is so and what i
with those that are not as satisfactor
others is what I should like to know.
clearly nothing to do with the stock o
the Rose is budded, the soil, aspect,
vation, because all are grown under t
conditions, and therefore should all fa
succeed. This is the point of interes
but as a mere tyro I suggest that th
which failed were bad and the nurs
responsible for the failure. AMA

Kenya Horticultural Society: appeal

As you have so very kindly given
mission to appeal to the generosity
readers, may I explain as shortly as
the needs and hopes of the Kenya
tural Society?

This Society was started some seve
ago by a small party of very keen ga
in Nairobi. It is very much an
Horticultural Society, as profession
deners are very few and far between
colony, and practically everyone has t
whole of the skilled work of the
themselves, as the native labour avai
only of the roughest type and with t
possible knowledge of horticulture.

Climatic difficulties, strange diseas
pests, all have to be coped with and
by the garden owner, and to most of
sub-tropical plants we grow were qu
known until we arrived in Kenya,
many cases broke up virgin forest or
make our gardens.

Bearing in mind all such difficu
think we may be proud of being able
that our Horticultural Society has
steadily ahead, has paid its way fr
beginning, and has never been in debt.

We hold two shows every year in
and sometimes a third, and also
organising and running the hortic
section in the big agricultural shows.

Our present trouble is that we ha
veloped too well, and have no longer
cient space in the one possible
Nairobi, which is the Settlers'
Memorial Hall. As a result, classes
be cut down and exhibits sadly crampe

We have, therefore, started a B
Fund, and aim at collecting £5,000.
hope to build on to the existing hall, a
is land available, and the hall would
mensely improved for all sorts of us
sides those of the flower lovers.

The colony is not rich and our me
are all hard-working men and womer
very little chance of collecting so la
sum in Kenya, therefore the Com
asked me, as President, to try and
funds from sympathetic gardener
England. All subscriptions will be
gratefully welcomed and should be
direct to The Lady Muriel Jex-Blake,
House, Salisbury, which is my address
in England. MURIEL JEX-BL

The value of wasps

A day or two ago I had my cur
aroused by some half-a-dozen wasps
about on the tennis lawn about 2 inch
the grass. On giving a close observatio
a few minutes I soon saw one settle
immediately start tugging at something
all the power it had in its body, whic
closer examination proved to be a Le
Jacket, the grub of the Crane Fly or
Long-legs. I watched the same for abo
minutes and saw these wasps discover
of the grubs, kill them, and start to ea
same. For the benefit of our readers

going to secure some old rubber ground ts, saturate the ground under them, and a matter of 12 to 24 hours I have read can sweep them up in dozens.

e Gardens, Northcote, A. CARD.
Reigate, Surrey.

The garden cottage

NOW in the middle of September the borders round the cottage are a bright mass of flowers. Zinnias, African igolds, Geraniums, and Gaillardias make brightest show, with an upstanding patch ladiolus and a groundwork of China rs in shades of purple, some showy stemons, and a background, just beyond open porch, of rich, red Hollyhocks. from the road there is a glowing mass Dahlias, orange, red, and dark. The ge itself, built about 30 years ago, has ndsome timbered front after the manner e older cottages of the district; the oak ering has turned to a quiet grey, well off by the whitewashed plastering be- ven; it forms a becoming background to blaze of flowers at its foot. G. J.

The cottage garden in the middle of September, containing a show of Zinnias, China Asters, Gladioli, African Marigolds, Geraniums, and Gaillardias

Asarum europæum

y experience with this coincides with that A SCOTTISH GARDENER" (page 594). I it on a rockery which I considered to be damp for most rock plants, so re-made it much lighter soil. The result is that um europæum and certain other things died. A. H. WOLLEY-DOD.

Gentiana lagodechiana

e form of this Gentian, which I have, ers about a fortnight later than G. emfida, and has a flowering season at twice as long. I think it is the more able plant of the two, though there is to choose between them except habit. aps G. lagodechiana flowers a little e freely. I believe it is only varietally nct from G. septemfida, not a distinct ies, though I have heard this disputed.

A. H. WOLLEY-DOD.

Gardens in Ancient Greece

I have read Mr. Spender's letter, which appeared in your issue dated September 28th, with great interest.

My article was mainly intended to show that the Greeks had an even greater need of flowers than we have in these days. Undoubtedly, they cultivated gardens mainly for utilitarian reasons—the fruit and vegetables for sale and consumption, the flowers for garlands.

Classical allusions to the subject, as Mr. Spender says, are almost negligible. The earliest allusion appears to be in Homer (Od. VII., 112-130), where the garden of Alcinous is described, and this is entirely vegetable and fruit. Aristophanes (Birds, 1066) speaks of sweet-scented gardens (kepous euodeis). Demosthenes (c. Nicostr.) refers to Rose gardens. Also see Pausanias I., 19, Sec. 2.

I have come across the following sentence in an article on ancient Greece written some years ago (1864), author unknown. "Modern society can scarcely form a conception of the extent to which flowers were cultivated in Greece." Later, writing of their fondness for garlands, he says: "This taste, which prevailed more or less throughout the whole country, as well as in Magna Græcia, Sicily, and Asia Minor, may convey some idea of the extent of floral cultivation, which everywhere constituted an important branch of industry."

With regard to Chæremon, the verses are cited in Athenæus, and can be found in Nauck's "Fragmenta Tragicorum Græcorum." It is a very free translation.

Barnes, S.W. 13. N. C. W. EDGE.

Dryas octopetala in Ireland

I noticed in an article in the number for August 17th, by "F. A. H.," that he finds Dryas octopetala a shy flowerer. On my old rock garden I had a large patch of the native variety which flowered abundantly, not once, but several times during the summer. Silene acaulis, though, was shy, but Sax. oppositifolia did splendidly. All these plants I brought from our limestone mountains, where they grow luxuriantly with other Alpines.

The articles about Val Piora have filled me with a great desire to go there again. When I went we walked from Airolo, thinking we were going for a short and easy stroll. There was no railway in those days! It was June, and the wealth of flowers from the top of the St. Gothard Pass down to Airolo was beyond description. L. E. CROFTON.

Co. Sligo.

Some Shortias

These interesting plants are beautiful of flower and of foliage, and deserve to be grown wherever choice plants are appreciated. They enjoy a cool soil and a half-shaded position, but to place them in full shade—and this is often recommended—is to deprive them of one of their greatest charms, the crimson colouring of their leaves in winter. S. galacifolia was discovered over 100 years ago by Michaux in the mountains of N. Carolina and rediscovered in 1877. The plant forms runners like Galax aphylla, and, indeed, was found in company with that plant. The leaves, of rather oval form, are deep green, shaded bronze, while the lovely flowers are reminiscent of those of the Soldanella, but larger and deeply fringed, pure white, passing with age to rose-pink. S. uniflora grandiflora is a most charming Japanese species. The handsome, glossy leaves pass to bronze and red, almost scarlet, and the large bell-like flowers are deliciously coloured soft pink. The Shortias flower in spring and early summer, and are veritable treasures for a cool spot on the rock garden. Grown in pans they are exquisite ornaments for the Alpine-house or cold greenhouse.

RALPH E. ARNOLD.

Three views of Pzo Columbe—a typical Dolomite mountain East of Piora
The home of Androsaces Chamæjasme, obtusifolia and lactea, also Linaria alpina alba

Ten Days in Leventina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

At the request of many readers, this diary is continued over a slightly longer period than was originally intended

(*Concluded from page 613*)

WEDNESDAY, JULY 10TH.

JOY comes in the morning. We make an early start for Pzo Columbe—not that we know anything about it, but in making our way to Lago Dentro we had seen to the west a mysterious looking mountain with rocky pinnacles rising high in the heavens like the points of the Drei Zinnen. We carefully looked it up on a large scale map and found it to be Pzo Columbe. It is so obviously dolomitic, even when seen as we only had seen it—many miles away.

The morning air is filled with sweet smells. The vanilla of Nigritella, and the aromatic fragrance of Arnica montana are unmistakable. Trifolium alpinum is another good scent. A pleasant smell, not easily defined, comes from Achillea moschata, which smothers the rocks by the side of the track with its pretty white flowers. This scent is borne on the air and at first it is not easy to detect from whence it comes. All of these plants are in full flower. By far the most powerful of all is pink Daphne, that abounds in large masses on the grassy slopes. This plant I had unhesitatingly taken to be the Garland Flower, D. Cneorum, but Dr. Jenkin, who is able to speak with authority on the mountain Daphnes, pointed out that this was D. alpina. From descriptions and illustrations I have since seen of D. alpina this must be a most variable species, both in c
and habit.

The sweet-scented Daphne alpina on the slopes of Corandoni

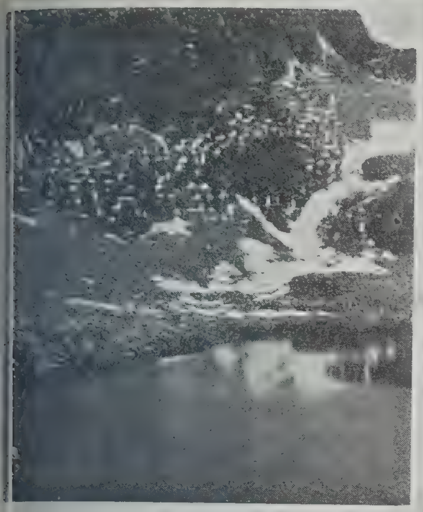
We did not find the plants we exp
around the pot holes or on the lime
pinnacles of Columbe. The high s
looked just the place for Thlaspi rot
folium, but we did not see it. As w
proached Columbe we saw less and le
the lime-hating Anemone sulfurea, A
montana, and Rhododendron ferrugin
while Azalea (Loisleuria) procumbens
abundant on Taneda, looked thoroughly
happy and gradually dwindled away a
approached the rocks of Columbe. O
the first plants to note on Columbe wa
lime-loving Hutchinsia alpina, but this
lated dolomitic mountain was not proli
species, as if the usual flora had not yet f
its way there.

We approached this mountain to the s
by the Passo Sole and then encircled it
turning to the north by Passo Columbe
is a most interesting experience to go
round the high slopes of a mountain.

It is grand to be in the Alps with
Jenkin, he is so far seeing and is abl
recognise and name the distant mount
many of which he had climbed. More
he has an eye like a hawk for minute p
in high places.

After crossing a patch of snow on the
side of Columbe I had the good fortun
alight on a real treasure; it was a
clump of Linaria alpina alba, a beau
pure white form, the very plant that
Doctor was looking for. Thus another dr
came true; and oh, the delight of findin
new plant. The more difficult a plant i
find the greater is the joy in finding it.
portion of this plant was removed, thoug
fear it has since died.

On our return in the evening we were
to learn of the arrival of an interest
visitor, Dr. Roger Smith, who had joined
select party at Piora. He was alone on
way back, after a lengthy plant-hunting
in the Balkans. He had evidently b
through a most strenuous time, scour
little-known parts of Serbia, Monteneg
Albania, and other uncomfortable corners
Europe in breathless haste with Dr. Guisep
Ingwersen, and other enthusiasts. He



Lago di Dentro

ring stories to relate of bandits in the ll and botanising with an armed escort on e lbanian frontier. He seemed well-nigh histed after his exploits, and fully appre- atl the comparatively quiet life at Piora.

[r. Roger Smith has very kindly written n ticle on his trip, which will appear in r ext issue.]

R. S. takes capital photographs in lcr of plants in their native habitats. o I wish that we could reproduce them. esent the high cost of colour printing nrs this impracticable, though by the n we celebrate our next Jubilee no doubt r illustrations will be in colour.

addition to the plants recorded, we had isday seen Saxifraga cæsia, S. crustata, osace lactea, and Draba aizoides, the t with yellow flowers on wire-like stems.

ny Gentians were also noted on the viz., Gentiana utriculosa with nine open rs on a stem, of real deep Gentian blue, nana brachyphylla, and luxuriant clumps bavarica. The glory of these Gentians s the lines by F. W. Bourdillon :—

"And on the green knees of those giant scars,
Ages ere man arose to mark the hours,
The dawn descending kissed awake blue stars
Of Gentians, and all tender Alpine flowers."

With these notes my diary closes, and I look back upon Piora as the gate between earth and heaven, to be re-visited on the first opportunity.

Sweet Peas in autumn

ALTHOUGH Sweet Peas were rather backward in their early stages of growth this year, they made amends during the months of July and August, and in September were as robust as ever and giving splendid blooms on long stems in most cases. In fact, I have never had plants do so well since they were taken down in July to 3 feet from 8 feet in height. Now most of the plants are again 7 feet in height. The plants have had no extra feeding other than several doses of liquid manure, soot water, Ichthemic Guano, and two feedings with sulphate of ammonia. One of the best varieties I have grown this season has been Pinkee, the very best rose pink. The colour is grand and the plant is a healthy, robust grower. Corona is another beautiful carmine-rose, with a pure white base to the petals. It is splendid when bunched. It is quite a satisfactory grower and has thrown a number of fives. Sunburst is far and away the best cream-ground Picotee. It was the first to bloom and is now in excellent condition. The colour does not run so badly as other varieties of this nature, and I strongly advise readers to give it a trial during the next season.

Hero is an excellent and very attractive variety, quite up to exhibition standard. The colour is a brilliant deep cerise with salmon sheen which does not fade in th

Pzo Columbe seen from the East

At the Cadlimohutte, about 10,000 feet

strongest sunshine, and shows up wonderfully under artificial light. Messrs. A. Searles have a new shade which might be termed cerise-salmon with a golden glow, and anyone who gives this novelty a trial will not regret it, for it is a good grower and carries any amount of well-placed fours on good stems.

Charming cannot be left out of a collection where a deep rosy cerise is desired. Although fairly old, it is still one of the best for exhibition. George Shawyer is the best orange-pink, in my estimation, after having grown it for several years. Mrs. Horace Wright may be called a giant rosy-pink flushed on a white ground. It must have sunshine in order that the best colours may be got out of it. Magnet is a glorious salmon-pink on a cream ground and is the only variety that has shown signs of streak with me this season. A variety that I chose in place of Picture in the cream-pink sections, and one with which I was very disappointed, was the new American-raised Fluffy Ruffles. Although it certainly gave some duplex blooms with very frilly flowers, it was in no way up to expectations. For a real fancy novelty I place Harlequin before all others, for there is something to my mind very fascinating about the blooms which have a Picotee edge of scarlet on a deep cream ground, with standards and wings heavily veined and marked with scarlet. It is a tip-top grower and very suitable for exhibition where 12 or 18 vases are required.

Although Powerscourt still holds its own in the lavender shades, I find Gleneagles is running it close, and, if anything, is of a purer colour. Chieftain is certainly the best mauve I have yet grown, and although not so sweetly scented as Mauve Beauty, it has a better colour and is a more robust grower. Those who require a real good violet-blue should give Fortune a trial, for it is " one of the best " and quite as strong in growth as any of the blues. Blue Bird and Heavenly Blue must both come before the old favourite, Mrs. Tom Jones, which has held its own amongst the Delphinium coloured Sweet Peas for many years. Blue Bird is certainly stronger in growth than Heavenly Blue, but not so clear in colour. Sybil Henshaw is still the best crimson I have grown, and Model the best white, while Olympia is far and away in front of the old favourite, Royal Purple. Although I like Matchless among the creams, I am afraid I must place What Joy in front, as it is more frilly and just as the buds open they are decidedly yellow, a colour which is a long time in coming in Sweet Peas. The Sultan is one of the best dark maroons on the market, but I have an idea that an amateur friend of mine will cause a sensation if he puts on the market an excellent seedling of his own raising which I have seen both growing and on the exhibition stage. It somewhat resembles Sultan, but is deeper in colour, more defined, and is an exceedingly good and healthy grower. A few that I have no further use for are Prince of Orange, a weak grower which scorches badly; Miss California, which has good colours but is a poor grower; Mermaid, a weak-growing lavender; Living Picture, neither one thing nor the other; 2LO, nothing in comparison with Huntsman, a colour hardly required; and Elegance, a very poor lilac-pink. W. E. WRIGHT.

Boronia megastigma

In these days, when, perhaps more than ever, perfume in flowers is so much appreciated, the Boronia megastigma should be remembered as one of the sweetest-smelling flowers in the floral world. One plant will make a full-size conservatory delicious, and perhaps sweeter in the atmosphere
the breeze than when smelt close at

The Boronia is one of those Aus
plants which like a sandy, peaty soi
like most of the Australian plants,
plenty of water during the growing
but less and careful watering in winte
it is dormant.

The Boronias, the Acacias (Mimosa
most of the Australian plants are no
cult to grow if one bears the conditi
mind already mentioned.

The propagation is less easy, but
ripened shoots root in sandy soil late i
mer in the propagating-house, these
potted into a sandy peaty soil whe
rooted and kept in a comfortable
during the winter.

Another good point about these Aus
plants is that they succeed in cold
houses, and many of them are hardy
doors in the southern and western c
when provided with a Rhododendro
Among these numerous varieties (whic

Fifty Years Ago

A Spruce Fir ornament

NE of the prettiest objects I ever beheld is a Spruce-cone, filled with sand and grass-seed, which latter routed and grew out of the scales. is now as large as a Cocoa-nut with e husk on, and of the most vivid reen colour. The grass grows with a xuriance that is remarkable. To roduce this charming specimen the ne was baked in an oven till the ales opened out equally. It was then arefully filled with equal parts of sand nd grass-seed, a string tied to the ift, and the whole suspended in the ark in a jar with water enough to me half-way over the cone. In a eek it was placed in the sunlight, hen the seed sprouted rapidly, and a month filled a gallon jar completely. It has been taken out and ung in the window, exposed to the air f the room. Every morning it is oroughly soaked in tepid water.

—April 5th, 1879.

To restore faded flowers

MOST flowers commence to droop and wither after being kept in water for twenty-four hours; a w can be revived by substituting fresh ater, and a pinch of saltpetre in it will nd to keep them bright and fresh. But adly withered flowers can be made esh by placing them in a cup of boilg-hot water, deep enough to cover at ast one-third of the stems; by the me the water has cooled entirely, the owers will have become bright and rect. Now cut off the ends of the tems about an inch and place them cold water, and you will be surrised at the reviving influence of this eatment. . Thin petalled, white, and ght-coloured flowers, however, will ot become so fully restored as high-oloured, thick-leaved blossoms.

—March 22nd, 1879.

Autumn flowers

I many gardens due regard is not always ai to securing a display of flowers in late rner and autumn. In borders where a is restricted many plants could be acommodated in the foreground of the rbery or in some of the out-of-the-way as which are so often unattractive. wing to the hot and dry summer we have perienced this year flowers are of short ation, but the later-flowering plants, beig ubject to less trying conditions, will last un longer and at the same time be bright nd effective. Japanese Anemones make a ne display and succeed well in partial shade. apnica alba is the most attractive, but e are other good forms. Very effective re the late-flowering Phloxes if given plenty f noisture. There are numerous good arties to be had. Rudbeckias make a fine isay, producing their flowers on firm, wiry s. R. Newmanni is a pretty dwarf rty, growing only 2 feet high. As the c of Rudbeckias are near the surface the i must be kept moist. Heleniums, both and dwarf, are also useful. Riverton ty and Riverton Gem give a fine disla when massed; and then there are the hrsanthemums and Michaelmas Daisies. Kniphofias, with their large tuft of leaves, make a striking effect when in flower. The late-flowering Ox-eye Daisies and Montbretias also give a good display, and Sedum spectabile, being dwarf with pink flowers, makes a good edging to the border. F. H.

Lilium giganteum

LILIUM GIGANTEUM delights in ample moisture, even a bog, and if in partial shade the flowers last longer than if in full sun. The tops of the bulbs should not be buried in the soil, though a covering of bracken or leaves during winter is necessary. It is best to plant medium-sized bulbs and let them develop, as large-sized flowering bulbs do not produce the same results as those which have established themselves a year or two before flowering. G. N. S.

Lilium giganteum at Daisy Hill Nursery, Newry

Oriental Lilies in Southern Scotland

If, during the autumnal period, the Rose is still the Queen, the Lily is, assuredly, the Empress of my garden. Most majestic of its kind, and towering high above the odorous Sweet Peas and luxurious Carnations (whose influence for artistic decoration is inestimable), are two splendid representatives of the Great Lily of the Himalayas, presented to me last November by a Scottish Earl, whose collection of Lilium giganteum is the grandest I have known, some of the finest specimens reaching an elevation of 13 feet. Those which I have had the great privilege of cultivating and watching their wondrous evolution have been only slightly lower than this remarkable height. The flowers, which are very long and lustrous, are pure ivory-white in colour and refined in their fragrance. By reason of their height and the abnormal dimensions of their leaves and flowers they require for their preservation from the power of sudden thunder-blasts a strongly protected situation, such as they invariably find at Castle Kennedy, also at Logan House in Kirkmaiden (my native parish), where, by Mr. Kenneth A. McDouall, they are grandly grown. The one limitation of this commanding Indian Lily is its comparatively short existence, and especially where it is greatly exposed, but it provides for its perpetuation by creating a considerable number of offsets, of which the largest has often to grow for several years before it attains to its full flowering size. But it also produces in succession to the flowers a large quantity of precious seeds. Next year I intend to add to my collection Lilium Philippense formosanum, a very beautiful pure white variety, which I have often seen and greatly admired in Logan Gardens.

While such impressive Lilies as the satiny-white Madonna of Palestine (Lilium candidum), Monadelphum Szovitzianum of Persia, and Mount Caucasus, Humboldtii, and Pardalinum, the Panther Lily of California, Lilium regale of Western China, and the exquisite longiflorum of Japan, which has several varieties, are in many of their attributes supremely attractive, I have a great love for the Japanese speciosum, picturesquely spotted, as its name implies, with charming green axils radiating from the centre and most delicately fragrant, of which I have over 100 flowers. From three bulbs and their offspring, this is the result. With me it is the chief abiding glory of September and October, and therefore I regard it as an inestimable possession, the loveliest companion of the latest Rose.

David R. Williamson.

Dahlias at Crawley

A VISIT to the nursery of Messrs. J. Cheal and Sons, Ltd., Crawley, Sussex, during the Dahlia season is an event of annual importance to those interested in these highly-attractive flowers. No fewer than 6,000 plants are grown, and every type of Dahlia is to be seen in this comprehensive collection. A large area is also devoted to seedling Dahlias, and from among these it is safe to predict another series of noteworthy novelties of various types of this wonderful subject.

The collection of Dahlias abuts on to the Brighton Road, and is a source of much interest to motorists and others who pass and repass the glorious blaze of colour that this collection represents. On the present occasion the writer went through the whole collection, noting those varieties that stood out from others for their usefulness in the garden. In this connection, habit of growth and freedom of flowering were essential considerations, and combined with these factors there was the question of colour, and this was considered to be of much importance.

Borders of Mignon Dahlias at Crawley

Small Decorative or Camellia-flowered Dahlias were first inspected. In this type are many free-flowering plants of good habit and striking colours. The better sorts were Mrs. Linford (scarlet), Mrs. Chas. Hay (salmon-red), Mrs. David Campbell (bright rosy-cerise), Mrs. Howard H. Crane (glowing crimson), Verity Wadsworth (canary-yellow), Red Rover (brilliant red), Cheal's Pink (rich cerise-pink), Topaz (brilliant scarlet), Crimson Flag (rich crimson), Reginald Corry (crimson, tipped white), and Mrs. Selous (salmon, suffused rose). They were a most attractive series. The Messrs. Cheal have always been noted for the beautiful quality of their single-flowered Dahlias, a few of the more striking examples being Mrs. J. F. McLeod (glowing scarlet), Amy Barrilet (crimson-scarlet, bronze foliage), Lady Bountiful (deep pink), Marion (buff, suffused rose), Brilliant (crimson-scarlet), Frank Galsworthy (crimson centre, shading off to salmon-rose), Rigi (tangerine), Albatross (pure white), Beacon (yellow), and Owen Thomas (crimson-scarlet, tipped yellow).

The miniature-flowered or small-flowered Pæony Dahlias are a great feature at this establishment. Generally, the plants possess a good habit of growth, and are very free flowering. It was difficult to restrict one's selection, but the following were most noteworthy:—Dazzle (brilliant scarlet), Beatrice (salmon, suffused rose and primrose), Favourite (rich apricot), Mermaid (bright yellow), Clara Hart (crimson-scarlet), Lady Macintosh (coppery-yellow, suffused salmon-rose), Bishop of Llandaff (rich crimson-scarlet), Pink Perfection (rich rose-pink), Radium (brilliant crimson - scarlet), Our Annie (shrimp-pink, lovely), Bhopal (bright, glowing crimson-scarlet), Schneider (velvety crimson), Saturn (rosy-salmon), Clarissa Gibson (salmon-pink), and Yellow Queen (sulphur-yellow). There were many others we would like to mention. Star Dahlias are almost the exclusive product of this Crawley Nursery, and Messrs. Cheal are constantly improving the quality of the flowers, which are ideal for indoor decorations, apart from their value in the garden, where they make a wondrously free display. The more noteworthy were:—Margate Star (yellow, bronze, and rose), Warnham Star (coppery-rose), Hookwood Star (satiny-pink), Richmond Star (rich apricot), Charlwood Star (fiery orange, tipped red), Epsom Star (rich coral-red), Haslemere Star (rose-pink), Primrose Star (primrose), and Rye Star (coppery-orange and rose). The flowers are generally borne on stiff, erect stems.

Pompons are well done here, and are a very representative collection. A few of the better sorts are worth mentioning:—Adelaide (blush, edged lavender), Bacchus (scarlet), Electra (deep orange), Glow (coral), Nerissa (soft rose), Darkest of All (maroon), Raider (yellow), Tommy Keith (red, tipped white), Ruby (ruby-crimson), Mavis (rich, glowing red), Little Beeswing (yellow, heavily-edged red), and Girlie (pinkish-mauve).

Mignon Dahlias are the especial care of the Messrs. Cheal. A long, wide
walk is flanked on either side with
masses of the different sorts comprisin
collection of this type of the flower, a
bedding purposes they are almost ind
able from July onwards. They were n
a great show. The more noteworthy va
appeared to be Emerald (rose-pink), D
(rich yellow), Harold (rich crimson),
Aileen (pink, with darker ring in c
Lancer (scarlet), Mincio (bright sc
Rosebud (salmon-pink), Empress
purple), Edith (pale satin-rose), Ka
(deep apricot), Josephine (primrose-y
and Julius (bright rosy-scarlet).

Space will not permit the enumerat
the better Collarette sorts, nor the
flowered Decorative varieties, of which
there was a magnificent representation.
den and exhibition Cactus Dahlias wer
largely in evidence, as were also the
flowered Pæony varieties, of which
there were many beautiful examples.

As a whole, the collection is well-
and freely-flowered, and serves to illu
the great advance made in this showy
ject in more recent years. D. B. Cr

New certificated Chrysanthem

Thirteen new varieties of Chrysanthem
were placed before the Floral Committ
the National Chrysanthemum Society a
meeting on Monday, the 23rd ult., hel
the Committee-room of the Royal Hort
tural Society, Greycoat Place, London, S
Four First-class Certificates were award
the following novelties:—

SOLIDITY.—A promising early variety su
for disbudding. The blooms are fully 4 in
in diameter and are made up of fairly b
florets rounded at the ends and of sple
substance. Colour, golden-yellow, ti
bronze. A good variety for market grow

BRIDESMAID.—A distinctly pretty bl
having fairly long florets of narrow
medium breadth, building an attrac
flower of drooping form some 5 inches in
meter. Colour, a charming salmon-
with fawn centre. Both shown by Mr.
Shoesmith, Junr.

ASSURANCE.—As shown on this occasion
blooms were of splendid quality and most
tractive. The florets are fairly broad
pointed, and build a full flower of beau
form about 4 inches in diameter. Col
chestnut with golden reverse.

DART.—Another pretty bloom noted for
colour, which may be described as br
chestnut, tipped gold. The florets are fa

and build a capital disbudded flower 3 inches to $3\frac{1}{2}$ inches in diameter. The st-named, shown by Mr. J. A. Barrell, vorthy of the attention of market rs.

romising large exhibition variety that answer the purpose of market growers grow large Japanese blooms for market

L ENCE-MARTIN-ROI. — This bloom is 8 inches in diameter and has broad that reflex and curl in at the ends, ing a flower of good, even form. r, pale pink on silvery-white ground. een in flower for some time. Shown M. V. Martin et fils, Champigny.

D. B. CRANE.

R ort on condition of horticultural crops on September 26th, 1929

VEGETABLES

B t.—Fair to good generally.

B ccoli. — Backward. Aphides have d very severe damage, particularly in rdshire. Caterpillar is general in vall and the south-western counties.

B ssels Sprouts.—Growth checked by ht and crops are generally well under ge. Aphis attacks prevalent and very on light, dry soils, particularly in Bedire. A very large acreage of Sprouts dry areas is already beyond hope of ery.

C bage (autumn-sown).—In most dis planting out is delayed by drought.

C rots.—Variable, but generally about ge.

C liflower.—Much below average, owing ought and attacks by aphis and caterill. Crops severely damaged in Bedfordand some other parts.

C ery—Rain badly needed. Crops in soil than fen are below average. Fen crops to fair.

K le.—Backward; growth much checked ought.

L ks.—Generally small; somewhat back

C ions.—Bulbs small but generally sound; ing well.

P rsnips.—Fair but fly very prevalent.

S oys.—Variable; generally below avermuch damage by aphis and caterpillar.

T matoes (outdoor).—Very good crops of l, well-ripened fruit.

T rnips.—Poor and patchy; generally under average except in the northern counties.

FRUIT

Apples.—Fruit is small but of very good quality on the whole. Heavy gales on Friday, September 20th, caused a large amount of dropping. Crops generally are about average.

(Culinary varieties).—Bramley's Seedling variable, but good in Kent and Middlesex. Lane's Prince Albert good, Newton Wonder light to fair, Lord Derby fair in all districts. The late-keeping varieties are particularly good in Wisbech area.

(Dessert varieties).—Cox's Orange Pippin fair; Allington Pippin fair to moderate; Ellison's Orange good.

Pears.—Fruit small to average in size; of excellent appearance. Conference crop good; Fertility fair to good; Hessle fair. Culinary varieties light to moderate.

Cider Apples.—Light crops generally.

Perry Pears.—Good in Gloucestershire; elsewhere light to moderate.

The greengrocery of the classics

During the drought a lover of Lettuces might have been tempted to imitate the example of Aristoxenus, a Greek philosopher and writer of music who lived about 320 B.C. This gentleman was in the habit of watering his Lettuces with wine in order to increase their flavour. In those days the Lettuce seems to have been universally honoured. It was often used as an incentive to sleep, and is said to have cured Augustus of hypochondria.

Broccoli was the favourite vegetable food of Drusus, son of the Emperor Tiberius, and as the father had an equal fondness for it, the master of the Roman world and his illustrious heir were constantly quarrelling like two clowns when a dish of Broccoli stood between them.

Artichokes grew less rapidly into aristocratic favour. For a long time they were only used by drinkers as a cure for headache and by singers to strengthen the voice. Pliny pronounced Artichokes excellent food for poor people and donkeys!

Asparagus was well-known both to Greeks and Romans. In those days it was grown from 12 feet to 20 feet high. Under the Romans, stems of Asparagus were raised of three pounds' weight. The Greeks ate of the dish more sparingly, as their doctors denounced Asparagus as injurious to the sight. On the other hand, it was said that a slice or two of boiled Pumpkin would re-invigorate the sight which had been deteriorated by Asparagus.

Shinfield Star, a true star-shaped flower of intense orange-scarlet

A more favourite dish at Athens was Turnips from Thebes. Carrots, too, formed a distinguished dish at Greek and Roman tables.

It is said that Radishes were once grown to an enormous size, and that it was not uncommon for them to be a hundred pounds in weight. Possibly the Horse Radish is a descendant of a gigantic ancestor. This root had at one time a great reputation and was supposed to cure every evil in life.

The Cabbage was variously viewed by the Ancients; in one country it was an object of worship, in another of contempt. The Egyptians made of it a god, and it was the first dish they touched at their repasts. The Greeks and Romans took it as a remedy for the langour following inebriation. It was also recommended as a specific in paralysis, and, boiled in salt, as a sovereign remedy for the colic.

N. C. W. EDGE.

White Star Dahlia sent out from the Crawley Nurseries

It is free-flowering, effective, and invaluable for cutting

Club Root

This most disastrous disease attacks Turnips and all kinds of greens in the vegetable garden. The symptoms are very well marked. They consist of the development on the roots of ugly, irregular swellings, which so disorganise the activities of the affected plant that it soon becomes but a shadow of its real self. As Club Root is essentially a disease of acid soil conditions it follows that the cultivator should do all in his power to correct these. Obviously lime is the most potent alkali at the command of the gardener, and I have found, as a result of exhaustive experiments, that the form known as ground limestone is easily the best corrective of Club Root. It should be forked into the soil at the rate of 1 lb. per square yard immediately the diseased crop is cleared. In addition, every gardener should prove himself a hygienist by destroying in the furnace every diseased root. If by accident or design such are allowed to lie about, they become fertile nurseries for the spread of Club Root.

G. H. C.

REMINDERS FOR THE WEEK

Southern and Midland

Fruit gathering

The time has now arrived when the majority of Apples and Pears must be gathered and placed safely under cover. There are, nevertheless, a few specially late varieties which may with advantage be left upon the trees a little longer. Storing of these should, however, be attended to as soon as the fruits fall readily into the hand upon being slightly raised. I strongly advocate the thorough ripening of Apples before storing, as it makes all the difference to their keeping qualities.

Keeping fruit

Unfortunately, this is not understood as it should be, either through lack of advice or practical knowledge, and it is appalling to see what had been fine fruits withering up on dry stages a few weeks after being gathered. Pears keep best when a temperature of about 45 degs. can be obtained in a dark room where air may be admitted only when necessary, but Apples require a cool, dark store-room where air may be freely admitted as occasion demands, draughts being avoided. The floor should be an earthen one, or, better still, of stone slabs, or even concrete, both of which surfaces throw off just the amount of moisture required to maintain the fruits in a fresh, plump condition. The roof and walls must be made as cool as possible, and, given these conditions, Apples will keep for months on end, even though piled on stages or floor half a yard deep. I have personally stored them 3 feet in depth on such floors and left them for three months before further attention has been given, without the slightest detriment to the fruit.

Chrysanthemums

With the rapidly developing buds comes the question of ventilation and watering now that all are under cover. The conditions of September evenings should be copied indoors as far as possible for a time, for too dry an atmosphere is not advisable until colour in the flowers becomes conspicuous. Fire heat is scarcely advisable before the middle of the month unless a very wet spell, with a fall in temperature, sets in. Feeding must be carried on with liquid manure until colour in the bloom becomes prominent, when this should cease. Air freely on all favourable occasions, but remember that draughts must be avoided.

Bulbs for forcing

Those plunged in ashes or fibre for the earliest forcing should be examined from time to time and when shoots 1½ inches in length have been made, they should be uncovered and placed in a cool frame, exposing them to the light gradually. Roman Hyacinths, Freesias, and others will be among the first requiring this attention.

The Alpine garden

Alterations or additions to this department may now be commenced, as it is congenial work during this and the following month. The majority of plants, too, may also be transplanted during this time with perfect safety and quickly take hold of the new soil. Where old colonies of plants have outgrown their place or are in need of division, no better time could be chosen for transplanting. New plants, too, may be acquired and planted forthwith. Homes must be found for seedling plants which have been carefully brought along in pots and which cannot be wintered under glass. In the case of established colonies, a light top dressing of leaf-mould will prove beneficial.

Spring bedding

This must now receive some thought, as many of the beds must shortly be cleared of their summer occupants. Such beds should be given a dressing of well-rotted manure or leaf-mould and deeply dug in readiness for the spring-flowering subjects which must shortly be put out. All kinds of spring flowers intended for this purpose must be liberally supplied with moisture until finally planted out.

Preparing new Rose beds

Do not postpone the preparation of these until they are actually required, as a little time in which to allow the soil to settle down after trenching is desirable before actual planting commences. Therefore, trench the positions 3 feet deep, working in a generous quantity of well-seasoned manure and old lime rubble if the soil is on the heavy side, adding a sprinkling of ¼-inch bones to the last foot of surface. The whole should be thoroughly mixed together.

Kitchen garden

Store all roots which are liable to damage by frost without delay and remove all spent crops in order that material may be carted upon the ground in readiness for digging or trenching. Remove the old growth from Asparagus beds and hoe and clean them. Continue with the earthing up of Celery and Leeks, and keep Celeriac well supplied with moisture.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The propagation of bedding plants

This work must now be brought to a close, as it is useless to attempt cuttings of the bulk of bedding plants after the middle of September. Shrubby Calceolarias, if still undamaged by frost, may yet be secured with a fair chance of success. Pansies and Violas, too, if sufficient stock has not already been got, can still be attended to, but speaking generally, all the cuttings of the ordinary bedding plants should have been inserted some weeks ago.

Gladioli

As soon as the plants go out of flower, they may be lifted and " heeled in " among sifted coal ashes in a deep cold frame, in which position they mature quite as well as they would if left in their flowering quarters. By lifting them now there is less fear of the ground being " soured " by working on it while wet and sloppy, as is so likely to happen later on.

Lifting tuberous-rooted Begonias

While it is always advantageous to leave out these bulbous plants until frost blackens the foliage, it is dangerous to postpone the business too long. If, therefore, frost has crippled them, the sooner they are dug up and brought into safe quarters the better. When dug up, set in shallow boxes until thoroughly dry, when the bulbs can be packed into boxes, hollow side down, using plenty of dry sand between the layers. Set in a dry, cool place, but safe from frost.

Bedding Pelargoniums

Should the stock of cuttings of these be likely to be short, some of the old plants can now be dug up and boxed or potted and set in a slightly heated house or pit. Be rather sparing with water all winter, and in spring a number of good cuttings w available, these rooting readily in a house. Besides furnishing cuttings, t plants, if given decent treatment, will for planting out again next May.

The Asparagus beds

As soon as the stems are ripe, have cut down to within about 3 inches ground and then remove all weeds tha be growing on the beds or alleys. A ous mulching of farmyard manure then be applied all over the beds in that the crop may not suffer from pove the soil.

Lifting Beetroot

While there is no particular hurry this work, there is little to be gain leaving the roots out much longer. a dry day, therefore, and carefully li bulbs. Have them stored in plen dry sand or dry sifted soil. A cool, dry frost-proof place is necessary if the roo to keep in good condition over winter.

Remove spent vegetables

It is always desirable to remove all vegetables as soon as the useful portion used, not only for the sake of tidiness— of considerable importance—but also to vent the waste of valuable plant food in many cases is being absorbed by the less portions of crops. Their removal helps to get rid of various pests, and is gether a most desirable bit of work a time.

The final earthing of Celery

Very shortly now this important bus must be carried out. Soil and plants s be in a fairly dry state, for it is impo to have the work carried out in a p manner. The soil should be made m ately firm round the plants and the r raised a little in the centre, while the should be beaten firm and smooth with back of the spade, thus helping to she rain.

Housing late Chrysanthemums

If any of these are still out-of-doors it now be well to have them moved into a l airy glasshouse, as autumn gales, if frost, will do much harm to plants in open. Give all air possible day and n and have the plants sprayed overhead evening for the first 10 days or fortnigh

Strawberry plants for spring

To ensure good, well-rooted plants for ting out in new beds in March or April, g strong, well-rooted runners should now lifted and laid in in nursery rows on a su border, from which they will, as a rule, well when wanted. Label correctly an avoid confusion at planting time.

Planting of fruit trees

While yet too early to carry out the ac planting, it is not so as regards prepa the ground for their reception. It is a ser mistake to dress heavily with manure ground where it is intended to plant Ap Red and White Currants, Gooseber Cherries, Pears, and Plums, as this only duces soft, rampant growth that can n carry good crops of fruit. Black Curr and Raspberries, on the other hand, n have richly prepared ground, and if in pa shade and of rather a damp nature, so m the better. In any case, the ground sh be double-dug now and will then be in condition for planting early in Novem Do not work the ground while sodden.

C. BLAI

Preston House Gardens, Linlithgow.

PLANTING BULBS OUTDOORS AND IN POTS

Planting bulbs outdoors

TOBER is a good time to plant
itdoors bulbs of various kinds intended
flower next spring. The Daffodils and
s may be planted in the grass, flower-
and borders, or massed together in

Daffodils on a lawn

Among the many varieties suitable for naturalising and planting in woodlands, shrubberies, orchards, and in grass are Emperor, Empress, Sir Watkin, Golden Spur, Henry Irving, Barri conspicuus, Old Pheasant's Eye, Ornatus, and Telemonius Plenus, the double yellow Trumpet Daffodil

rations for the purpose of supplying cut
rs in the spring. Anemone roots should
anted in clumps, in which manner they
a gorgeous display. The St. Brigid
are especially brilliant in colour. The
ns are covered with about 3 inches of
the clumps of roots being divided by
6 inches.

re are several kinds of spring-flowering
so cheap as to be within reach of all,
hey should be largely used by all who
gardens to adorn. Very pretty and
ng effects may be produced by planting
of them amongst the grass under de-
us trees, as in such places Crocuses,
r Aconites, Snowdrops, Squills, Dog-
Violets, Chionodoxa, and Daffodils
uite at home, especially in cases where
ees are on raised ground, as then the
s show off to advantage. All that is
sary in the planting is just to dibble the
in and to fill up the holes with light,
oil, putting them in in patches here and
so as to make them look as natural
ssible. By leaving them to make their
h and ripen off, the bulbs will become
ished and come up from year to year.

ips of both Cottage and Darwin sec-
should now be freely planted for spring
s, and Narcissus, not omitting a few
refined and beautiful species, grouping
in choice spots which readily catch the
nd where they will remain undisturbed
number of years. Angels' Tears Daffo-
arcissus triandrus albus), N. cycla-
is, N. moschatus, N. Bulbocodium
phyllus, N. minimus, and N. nanus are
of this class, and we would add N.
of Spain.

Narcissus cyclamineus

OU may know N. cyclamineus pot-
rown on the show stand or in the
lpine-house. You may be familiar with
aping grace of its six yellow petals flying
and baring the miniature trumpet, but before you can claim a close acquaintanceship with it, before you can have an intimate knowledge of its charm, you must watch it springing up in drifts by the brink of some woodland stream to lighten the drabness of February at the first sign of the sun's taking on new strength for the spring.

Native of river banks in Portugal, it revels in the coolness of a woodland glade or the dampness of a stream-side in this country, and in the sandy part of such a wild garden as makes a good home for Rhododendrons and Lilies it will readily become naturalised, carpeting the ground and making a golden setting for the pinks and mauves of the earliest Rhododendron species.

At Wisley, where this photograph was taken, it is thoroughly at home—has been seeding itself for years, and shoots up each spring in ever-advancing colonies, of a charm which nothing but naturalisation could have produced. Poised on their delicate stalks that sway them to the slightest breeze, the flowers might be taken for a cluster of golden-winged insects pausing in their flight to hover over the greensward of Moss or fluttering up a grassy bank to catch the first rays of the February sun. The upturned petals are, in fact, folded back from the naked trumpet, exactly as a butterfly, at rest, folds its wings back, one against the other, over the body.

The Cyclamen-Daffodil should be raised from seed, which will give you a flowering colony in three years' time; and this, in its turn, will spread by sowing its own seed if you can once make it happy, but the tiny bulbs will not divide.

If ordinary Daffodils are growing in the same garden hybrids will probably spring up in the ranks of the cyclamineus. Amongst those shown in the photograph are one or two glorious creatures—cyclamineus, obviously tainted with the blood of the full-blown trumpeters, grown taller—the little trumpets longer and distended, and the petals merely standing off instead of lying right back against the stalk. In another part of the garden is an almost exactly intermediate hybrid, a really beautiful thing on a stem full 18 inches high, the flower the size of a small Daffodil, but the trumpet far more slim and dainty, with the petals more slender, too, and winging back only far enough to form a broad, open funnel.

Narcissus cyclamineus hybrid grown in a pan

Daffodils in pots

OF all the spring-flowering bulbs suitable for growing in pots the Daffodil is, in many respects, the most satisfactory. It is fairly easy to manage, blooms for a fairly long period if kept quite cool after coming into bloom, is of great value as a cut flower, while the bulbs, if given a little good treatment after flowering, are of great value for planting out-of-doors, either in the garden or in rough grass, thriving even under large deciduous trees.

When wanted for pot culture it pays, in the end, to secure the best bulbs, even if a little more has to be paid for them. While not at all fastidious as to soil, it will be found that best results are had by using good, sound, fibrous loam, with about one-third its bulk of leaf-mould added, and enough coarse sand to ensure porosity. On no account use animal manures, but the compost will be improved by allowing a 6-inch potful of bonemeal to each barrowload of soil.

The pots should be perfectly clean and have a fair amount of drainage added. For the varieties with large bulbs 7-inch pots are best, while the 6-inch size suits for those with smaller roots.

The bulbs may, with all safety, be packed quite closely together; thus the pots will hold from five to seven roots each, and will make a fine display when in flower. The bulbs need not be quite covered, or at least part of the necks may be left above the surface. The compost should be left a little loose *under* the bulbs, but must be quite firm on the surface. After potting, arrange closely together in some sheltered corner out-of-doors and on a hard ash bottom. Give a good watering through a coarse-rosed can and then cover over and around with sand, or even old potting soil which has been passed through a ½-inch riddle. Coal-ashes should not be used as a plunging material unless they have lain exposed for a year or more.

Even more so than with other bulbous plants is it necessary to have the Daffodil well rooted before removing from the plunge. Three months is not too long, while it must never be less than 10 weeks if best results are to be looked for. After being assured that the bulbs are well rooted, they may be removed from the plunge and set in a cold frame, covering the sashes with mats for a few days and keeping rather close. Afterwards gradually admit abundance of air and all the light possible. A fortnight in the frame and they are ready for a light, airy greenhouse. No more fire-heat must be given than just sufficient to keep out frost. This is very important, especially at first, for a high temperature will cause the bulbs to go "blind." The only time a little forcing is permissible is after the flower-stems rise, when a little gentle warmth will encourage the blooms to open a little earlier.

If wanted for planting out, the pots, after the flowers have faded or been cut, should be set in a cold frame, be given water when necessary until the hardest of the frost is over, when they can be stood outside until the foliage dies down, and can then be shaken out, dried in an open, airy shed away from the sun, and planted out in August or September.

While the majority of Daffodils do quite well in pots there are some specially suited for this method of culture. The following are always reliable, free-flowering, and of strong, robust habit:—Emperor (very good, but the blooms last a shorter time than the others), Empress, Horsfieldii, Sir Watkin, Victoria (probably the best bicolor for pots), Henry Irving, Golden Spur, Mme. de Graaff, Mme. Plemp, P. R. Barr, Princeps, and Weardale Perfection.

Coreopsis grandiflora superba

For the flower garden this is certainly one of the neatest and most elegant of hardy plants now in bloom. The plant is worth more than passing notice, for it is rarely we find such profuse flowering in combination with so acceptable a colour. Its remarkable freedom of flowering renders it specially suitable for large beds, and well grown in such its blossoms—a beautiful shade of clear yellow—may any day be counted by the hundred. In this way a profusion of its handsome blossoms is kept up for weeks together. For vase decoration the thin, wiry stems are excellent in every way, and little wonder the plant finds such favour with the florist generally.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish pl*
be named should send fair examples of ea
stem, leaf, flower, or fruit. (Snippets of
and points of shoots are useless.) Not mo
four plants should be sent in any one week
same correspondent. Where more than on
is sent they should be numbered. Of conif
cones should always be sent.

Naming fruit—*Several specimens in d*
stages of colour and size of the same kind
assist in its determination. Single, unri
deformed specimens are difficult to nam
do not undertake to name more than
varieties at one time.

FRUIT

Grapes shrivelling

(E. M. S.).—Have you not permitted the soil to get too dry? You may also have kept the house too warm. Grapes ripening in summer and early autumn should have abundance of air and little or no fire heat, while the soil at the roots should never be permitted to get really dry. If the printed directions supplied with each parcel of Thomson's Vine Manure were faithfully carried out nothing but good would follow its use, and as it is a perfect vine food, the use of liquid manure was superfluous. You can do nothing now to bring back the berries to a plump condition, but the hints offered above, if given attention another year, will, we doubt not, prevent a recurrence of the trouble.

Transplanting Gooseberries

(A. W. Butler).—The best time to transplant Gooseberries is early November, but they may also be safely moved during February. Young bushes, if carefully transplanted, should not lose a crop. It is really hardly worth while to transplant bushes much over six or seven years old, not but what it can be done, but seeing that young plants quickly come into bearing there is little to be gained by moving old bushes, and the labour entailed is considerable.

Pear and Cherry Slugworm

(Tadpole).—The creatures you send are the larvæ of the Pear and Cherry Sawfly (Eriocampa limacina). The adult Sawfly appears in May and June, and eggs are laid on the undersides of the leaves. After about 14 days the eggs hatch, and at first the larvæ are whitish in colour, but they soon become darker and assume the dark, slug-like appearance. When fully fed the larvæ moult and change to orange-yellow caterpillars of the typical Sawfly caterpillar appearance. At this stage they enter the soil and pupate. The adults emerge after about 14 days. Two or three generations arise through the season, the last generation remain as caterpillars throughout the winter within their cocoon in the soil, emerging as adults in May and June. Slugworms are easily killed by spraying with a nicotine insecticide. Freshly slaked lime dusted over the foliage will kill the larvæ, especially at this period of the year. Some of the creatures will have already entered the soil for the winter, and these could be killed by applying flake naphthalene at the rate of 2 ozs. per square yard, forking in the material 4 inches deep.

Leaf Spot of Raspberry

(Red House).—The specimen Raspberry leaves have blotches which, if opened, will be found to contain caterpillars. These caterpillars are those of one of the Sawflies, but although we have received the pest from time to time from our readers, we have not succeeded in rearing the creatures to the adult stage for identification purposes. It is unusual for the pest to be present in sufficient
numbers to do any harm, but if it is
to adopt control measures, a strong
spray should be used. A winter wash
not do any good with this pest. S
with tar oil would keep aphis in check
are troublesome in your garden.

Grease-banding fruit trees

Please give me a little informat
grease-banding trees. Is it necessary
paper bands on first in all cases?
pasted some on trees where the bark i
smooth, but I still have some larg
rather gnarled and uneven. Can I ap
grease direct with advantage or shou
harm in any way? I fear that I co
get the bands to fit these old trees well.

Leominster.

[Grease-bands should be put into p
at the beginning of October and sho
kept tacky until April. At this peri
bands should be removed and burnt.
on by coating the main stem of the tre
the position of the band to the groun
with thick limewash. The limewash
in any eggs laid by females which go
the band and turn back. Materials us
grease-banding vary considerably, but
main fall into two groups:—(1) Thos
greasy nature; (2) those that are stic
not containing grease. Greasy compo
must never be applied direct to the b
serious injury to the trees may result.
also applies to some of the sticky comp
in class 2. It is generally safest alw
apply a band of paper first, but we thin
in the case of trees that have very u
stems you might risk applying a good
material direct to the trees. Several
materials are advertised within our
tisement columns. If you have any
where it is impossible to apply the g
bands high enough to prevent rain
splashing soil up to the bands you s
place straw on the soil first. The straw
vents the bands becoming soiled.]

Apple caterpillars

(A. Gordon Forbes).—The caterp
which are at the present time to be
within Apples are those of the Codlin
and grease-banding can have no effect
the control of this pest because the egg
laid by moths which are fully winged,
therefore do not climb up the main ste
the tree for egg-laying purposes. Fur
the eggs are laid in the eye of the Apple
to early September. In districts w
Codlin Moth is plentiful, Apple trees sh
be sprayed with lead arsenate just afte
petals have fallen. For about 14 days
the petals have fallen the eye of the
remains open, and the object of the spra
is to force a little arsenate into the calyx
before it closes. If the spray is applied
the calyx cup has closed the control is
less. Lead arsenate is poisonous to man
domestic animals, and must be used
care. If you do not care to use the arse
you can do much to control the pest by b
ing the trees in June with old, frayed sack

one band near the soil and a second r up. Several folds of sacking should ied. The caterpillars on leaving the at- d fruits to rest for the winter are likely ke their cocoons within the bands you le. The bands should be taken off in er and burnt. A tar oil wash in winter ls aphis, helps to control the eggs of Moth, and also kills hibernating illars of Codlin Moth, but the latter are rotected by their cocoons. As there are l kinds of "White Fly" why not ask Horticultural Expert to call and advise This advisory service is free. Write first case to the Director of Agricul- County Hall, Lewes.

ter spraying of fruit trees

E. Crofton).—The best general winter s for fruit trees is undoubtedly one of the washes. We do not care to recom- one wash more than another, but you consult our advertisement columns. are several good washes at present on arket. We hope to publish an article r-oil washes when the work is season- With regard to the vegetable pests, we n that many of them could be cleared up plying flake naphthalene at the rate of per square yard after the crops are d and prior to planting the next. , there are several good soil insecticides sent on the market. You might try them, using the material according to aker's directions. There is no general a for both fruit trees and vegetables.

Leaf

E. Crofton).—There is no cure for affected "silvered" trees. All dead h should be cut out and destroyed by especially dead stumps. In gardens Silver Leaf is prevalent all pruning of should be done in August. Young attacked by this disease frequently re- but older trees usually die under the

sed Pears

bert Mosse).—Your Pears are affected Pear Scab. This disease can be con- by cutting out all dead wood and ng three times with Bordeaux Mixture. rst spraying should be given when the are in the Pink Bud stage, the second most of the petals have dropped from wers, and the third three weeks later. act that some of the Pears are normal that if you can control the disease your crop would be useful.

north wall

s. E. M. Lazenby).—The wall and posi- very suitable for Morello Cherries, and ould accommodate five or six trees. dessert Gooseberries, also White and urrants, do very well indeed on such when grown in five-branched cordon and keep until quite late if netted birds. Of Gooseberries, Warrington, and Red Champagne are excellent. urrants, Prince Albert and New Red White Currants, White Versaillaise ransparent. The soil for these should ply trenched and enriched, using a fair of old mortar rubble in the make up. ees may be planted any time between d of October and April, but the sooner ter.

TREES AND SHRUBS

d Oak tree

K.).—From your account it sounds as tree is exhausted, and no doubt it is ng from the drought. We suggest e soil be lightly forked up round the f possible at a distance equal to the of the branches. The ground should e top dressed with some rich soil, such as a mixture of fibrous loam and well-decayed stable manure. A top dressing of about 2 inches should suffice.

Pruning Magnolia

(I. M. Shand).—You do not state whether your Magnolia is a deciduous or evergreen kind. The deciduous Magnolia should be pruned, if necessary, immediately after flowering; little pruning is required, but straggling branches should be cut out completely. The evergreen kinds should be pruned in February, but again little pruning is required. The removal of the top of a Magnolia should be done either in February or immediately after flowering, according to the kind.

FLOWER GARDEN

Replanting Lilium regale

When should I lift and replant Lilium regale, grown from seed (March 27th). A good many have bloomed this year, and stems are still green. My soil is a medium loam, but rather a wet and cold sub-soil.

PEROVSKIA.

[You may safely lift and replant your Lilium regale immediately the leaves turn yellow, although no harm will arise if you leave them until December, from which time root action commences. A well-drained soil is necessary, but it is not advisable to make it unduly light by adding sand and ashes excessively.]

Improving a dry, rough bank

(Perovskia).—Trench the bank 2 feet deep, removing all the suckers as you do so, and work in a generous quantity of farmyard manure or Peruvian Guano, the former for preference.

Antirrhinum seedlings

(Perovskia).—We have examined both plant and soil submitted, and find nothing wrong with either; indeed, the soil is good, but if you could use a little bone-meal with it and make the whole firmer after planting, you should meet with greater success. The loam you are using is lacking in nourishment, and the bone-meal will, in this respect, improve matters. Snapdragons love full sunshine.

Pentstemons not flowering

(E. E. R.).—Unless your beds have been over-manured and so caused over-luxuriance, we cannot account for your Pentstemons failing to produce numerous side shoots after the central growth has run to flower, this being the usual behaviour of this plant, and these side growths, as a rule, produce a flower-spike each, and so extend the season of beauty by many weeks. Another season try rather poorer soil, and this should induce a more floriferous habit. The Pentstemon dislikes a shady position. Are yours growing in such?

Salvia uliginosa

Please tell me if Salvia uliginosa will stand out-of-doors during the winter, or had I better lift it and winter in cold frame? Also the best means of propagating same?

Herts. A. A. OLVES.

[This fine plant cannot be relied upon to pass the winter safely in the open unprotected, although occasional plants do survive. We advise you to lift your plant and winter it in a cool, frost-proof frame. Before doing so, however, take off a few of the young flowerless shoots and dibble them into pots of sandy soil. These should be struck in a cool frame or greenhouse, remaining in their cutting pots until growth commences in spring, when they may be potted up and grown on separately. Such plants make fine specimens, which commence to bloom towards the end of August and continue until stopped by frosts.]

Voilets failing

(Mrs. Pim).—Several things appear to be wrong with your Violets, but we think that the main cause of the trouble is Red Spider. It is now probably too late to do much good, but you might try the effect of spraying with Volck applied according to the maker's directions. Another season you should keep the plants well syringed with water during dry periods, and if Red Spider becomes troublesome in spite of the syringing, use Volck to control the pest. A leaf spot is present which could be controlled by the application of a suitable fungicide; the plants have been weakened by the Spider attack and the fungus has been able to make headway on the weakened plants. A leaf-mining maggot is also present, but is not serious.

Diseased Violets

(B. M., Harborne).—Your Violets are attacked by a Leaf Rust, but we think that the main cause of your trouble is Red Spider. The pest has taken most of the green colouring matter out of the foliage, and plants which have lost so much of their chlorophyll must of necessity go wrong. If all the plants are like those sent, your best plan would be to destroy your stock and start afresh. Please see reply to Mrs. Pim.

A sunny slope

(Italia).—The question appears to relate only to the sunny slope. As colour is desired, some of the rambling Roses, such as Hiawatha and American Pillar, both reds, may be advised. Though these are generally used in upright forms, as on posts, trellises, or arbours, they are equally amenable to pegging near the ground. No doubt the bank need not be all of bright colour; the remainder, or indeed, for the best effect, would be a clothing of the common Clematis (*C. vitalba*), flowering in August, and *C. flammula*, blooming in September. To ensure success, the places for the plants, especially the Roses, would have to be thoroughly well prepared with the care that any good gardener would understand. If the soil is not naturally calcareous some form of lime or chalk should be given to the Clematises, especially to C. vitalba, which in nature grows in almost pure chalk.

GREENHOUSE

Fasciation of Salvia

(Lady E. St. M.).—We do not think that you will be successful in reproducing the double-headed branches on the Salvia Bluebeard. If you examine the plant closely you will find that the stem is wide and much flattened, and that this fasciation starts at some distance from the ground level. These facts point to some injury to the plant, and insect attack is a likely cause. The cause of fasciation in plants is always difficult to determine, but we think that in this case the evidence does point to injury. You can, of course, try to reproduce the freak if you wish, and we shall be interested to know the result of your efforts. If the fasciation has been caused as we think, the plants should be normal next year, provided the same type of injury does not occur again.

Cineraria insects

(I. M. Shand).—From your description we gather that your Cinerarias are attacked by Leaf Miner. This pest is best controlled by fairly frequent fumigation with nicotine. Such treatment kills the adult fly before egg laying commences. Some growers report success from spraying the affected plants with a fairly strong nicotine insecticide; perhaps the better way would be to use both methods, especially in bad cases of attack.

MISCELLANEOUS

Potash manures

(G. O. T.).—It is somewhat difficult to advise you *re* the potash manures because so much depends on the type of land. We have, however, helped you over some points. Kainit is a quick-acting potash manure containing 12 per cent. to 14 per cent. potash. It contains amongst other things a lot of common salt. When kainit is applied in heavy quantities it is liable to damage certain plants, especially on some soils. Under garden practice it is usual to give kainit during autumn so that the salt contained therein is washed out by winter rains, leaving the potash behind for the crop the following year. We think that kainit should never be used on heavy soils because the material is apt to have a bad effect on the texture of such a soil. Sulphate of potash is a quick-acting potash manure containing 48 per cent. potash. It does not contain salt (sodium chloride). Sulphate of potash is safe to use on all crops and soils at any period of the year. Please notice that kainit is about 12 per cent. to 14 per cent. and sulphate of potash 48 per cent. potash. This means that if an equivalent amount of potassium is desired a soil must be dressed with 4 ozs. of kainit or 1 oz. of sulphate of potash. In bulk it is possible to buy kainit at about £3 per ton and sulphate of potash at about £12 per ton. In retail prices there is not such an exact difference because the rail charges and handling tend to make kainit less than four times cheaper than sulphate of potash. Under the conditions explained in your letter we should advise you to apply sulphate of potash at the rate of 1 oz. per square yard. Apply the material in autumn prior to forking over the borders for the winter. One oz. per square yard is only a mere sprinkling, and to ensure even distribution it is wise to mix the sulphate with an equal quantity of, say, dry soil or garden rubbish fire ash before application. It is easier to spread 2 ozs. per square yard than 1 oz.

Basic slag and wood ashes

(I. M. Shand).—Potash is one of the chemicals we have to add to the soil to maintain soil fertility. Wood ashes contain a certain amount of potash, and therefore is a useful material to use for this purpose; it can be used up to half pound per square yard. Basic slag contains phosphorus, which is another chemical required by soils, and is frequently used to add this ingredient to the soil. Basic slag is applied at the rate of from 4 ozs. to 8 ozs. per square yard. Roses require both potash and phosphate, so that wood ashes cannot possibly take the place of basic slag.

SHORT REPLIES

L.-G., Belgium.—Two useful books for your purpose are " A Handbook of Fruits : Stone and Bush Fruits, Nuts, etc.," and " A Handbook of Fruits : Apples and Pears," both by E. A. Bunyard, published by John Murray, 50A, Albemarle Street, London, W.

"OXFORD ROADLESS" BARROWS

are ideal for carrying loads over soft and uneven ground which an ordinary wheelbarrow cannot face satisfactorily

A high-grade production constructed of thoroughly seasoned timber.

Type "G" (illustrated) - -	£3 7 6
Grass extension - - -	10 0

The following are extracts from a few of the many appreciative letters received:

"The barrows have been in daily use for the past five months under all conditions, viz.: over rough, smooth, and boggy ground, and we have pleasure in testifying to their efficiency."

"I have nothing but praise for your Creeper tracks, especially on a three-creeper truck which you made for me a year ago, and I cannot speak too highly of its work."

"We now have a good many of these barrows in use, and they are a great saving in labour. We would not be without them for anything."

"Nearly twelve months ago we purchased a barrow fitted with one of your track wheels. We found this very useful, and far superior to the old style of wheel."

GARDENS and DESIGN

J. C. SHEPHERD and G. A. JELLICOE 63s. net.

With the aid of over one hundred beautiful drawings and photographs of famous gardens, old and new, explains the problems of garden design and the influence of such different factors as climate, soil, landscape, and history.

"All who love a garden might read these pages and ponder them."—*Journal of the Royal Horticultural Society.*

"A very thoughtful and stimulating work."—*Liverpool Post.*

ITALIAN GARDENS of the RENAISSANCE

J. C. SHEPHERD and G. A. JELLICOE 5 guineas net.

Provides unfailing delight and assistance to all who are interested in the planning of gardens, and in the wonderful gardens of Italy.

"Many magnificent examples of Italian palaces and villas and their gardens are admirably described and illustrated in this handsome book."—*Morning Post.*

MAKE YOUR GARDEN PAY

These four books are indispensable to everyone who wants to make his garden more profitable, more beautiful, and less of an anxiety.

SUCCESSFUL SPRAYING
by P. F. Fryer. 7s. 6d. net.
"This book can be strongly recommended to the grower who wants a handy volume in which he will find such information as concerns his plants set out in a concise and understandable manner."—*Journal of the Royal Horticultural Society.*

PRACTICAL SPRAYING
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
This book is one of a series of small practical handbooks written by specialists for the use of market gardeners, fruit-growers, nurserymen, etc. "Practical Spraying" describes the most effective measures to take against the various pests and diseases that ruin crops.

VIOLET CULTURE
by F. E. Dillistone, F.R.H.S. 2s. net.
This is the first book ever written explaining how to grow violets for large scale production in this country. It is full of expert information, and will prove equally valuable to the market gardener and to the amateur grower.

STRAWBERRY CULTURE
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
"The grower who cultivates a crop with brains stimulated by Mr. Morton's little book can reasonably expect to make a profit."—*Farmers' Express.*
"Of the utmost value to growers."—*East Anglian Daily Times.*

A catalogue of other books of interest and importance to the gardener will be sent free on application to—

Carpeting Plants to Use With May-Flowering Tulips

HE effect of all Spring-flowering bulbs is much enhanced by the judicious use of carpeting plants, but this is especially the with the many-flowering Tulips, which eason of their stature—some are as much o inches in height—are apt to look leggy ungraceful if they are allowed to rise ı the bare brown earth.

nong the prettiest and least hackneyed ırpeters are Viola gracilis and V. cornuta. the first Huntercombe Purple is a good ety; the colour is rich and its flowering son extended. a cornuta is less in colour, but it the merit of g very quick of th. Either makes lelightful background for pure pale w Tulips, such as nlight, Leghorn net, or Ellen nott, combined others of a soft trope shade—for nce, Corydon, Tristesse, or the H. Ewbank. The variety of Viola ıta is a good carplant to use with id red Tulip, of h there are so in both the Cotand the Darwin ns. Farncombe ers, Grenadier, Flambeau are very beautiful All the etias are charmfor carpeting, ıgh the colourof some of the varieties is a difficult perhaps. etia Fire King best with pale primrose or white Tulips, eep purple Dr. Mules with the same nation as that suggested for use with ırple Violas; Lissadell Pink with Carnaor Dainty Maid, while the ordinary ler of the older type is an excellent backd for deep yellow Tulips, such as n d'Or or Orange King.

neria maritima is an ideal carpeting owing to its neat habit and the pleasing green of its foliage. One of the prettiest le combinations is that of the dwarf Thrift and either the very pale shellTulip Margaret or Blushing Bride, has a pink flush on a white ground. ink Double Daisy Dresden China may be substituted for the Thrift with nearly as happy an effect.

Alyssum saxatile is one of the most general carpeting plants; A. s. compactum fl. pl. is the best form to choose as its height does not exceed 6 inches. Dark Maroon Tulips—Sultan or La Tulipe Noire, for instance—look well against it, as does the old Dutch Tulip Purple Celeste, either colour contrasting pleasingly with the gold of the Alyssum.

Arabis albida, whether single or double, is a useful if commonplace carpeter, which can, of course, be used with Tulips of all colours, while there is now a pink variety, Taplow Rose, that is specially attractive in combination with pink, white, and heliotrope Tulips in mixture. Among other good plants for the purpose in question are Polyanthus Primroses, particularly those of the Mrs. Spetchley strain, the colours of which are very beautiful and varied, and Myosotis. The value of the last named as a carpeting is almost too generally appreciated, and the combination of it with the pink Darwin Tulip Clara Butt has become more than a little hackneyed, although its beauty is undeniable. Rather more uncommon is the use of a Tulip in a definite shade of Rose—say, Rose Beauty, Prince Charming, or Salmon King, with Myosotis, Sutton's Royal Blue, or the blue ground will contrast well with bronze-yellow Tulips, such as Golden Bronze and Bronze Green.

Wallflowers can hardly be classified among carpeting plants, but their value when grown with late Tulips is indisputable. The deep red dwarf Vulcan goes with Tulips of almost all tones of bright red or yellow. Fire King is best combined with a pure white Tulip—Carrera, Themis, or Cygnet, for example—Ruby Gem with palest pink Tulips. Primrose Monarch is an admirable background for mixed Rembrandt Tulips, and the orange Alpine Wallflower, Cheiranthus Allioni, is a perfect setting for dark maroon and purple Tulips, such as the old Dutch Velvet King and William the Silent and the Darwin Tulip Fanet. R. E. H.

Tulips in spring border, with Arabis and Bunch Primroses

The Eschscholtzia

The Californian Poppy has much to recommend it to the lover of hardy annuals. To be most effective it must be grown in bold masses and the seedlings very drastically thinned in their early stages, a foot apart being none to much. The type, E. californica, has been known for many years, and while its glossy golden-yellow blooms are admirable, there are other colours available. Mandarin is a very fine form, its blooms being of a rich orange with a crimson exterior. E. crocea is of a good shade of yellow, and there is a form of the latter with creamy-white flowers. E. rosea is less satisfactory, it appears to be predisposed to revert to the white form from which it originated. E. tenuifolia, the smallest and neatest of the family, looks quite like a different species, but is merely a tufted and diminutive form of the original E. californica. This annual may yet be sown for early flowering during the earlier months of next year. Scot.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Judas Tree and Wistaria

I AM sending you a snapshot of a very beautiful specimen of Judas Tree in full bloom, with a fine Wistaria in the background, taken at Hyfield, Horham Road, Sussex, the residence of Captain Du Pre Lance. The combination of colours was very charming. MARY L. LONGSTAFF.

Garden House, Ightham,
Nr. Sevenoaks, Kent.

Cyananthus lobatus

This Himalayan plant is, indeed, a joy when in autumn it produces its cold, clear blue flowers upon trailing stem and, with a few other treasures, invests the rock garden with rare beauty and interest during an otherwise rather lean season. It is a perfectly hardy plant, of a succulent nature, and with numerous prostrate stems which appear anew each spring. The inflated calyces are covered with black hairs, and from them sprout the large Gentian-blue blossoms for long into the autumn. The plants should be placed high in well-drained loam enriched with a liberal quantity of leaf-soil and sand. They are good-tempered, but object to stagnant moisture during the winter. Cuttings will root in spring or early summer, and seeds, too, may be used as a mode of increase. A fine autumn is, however, necessary for the production of ripe seeds. C. lobatus was introduced to cultivation so long ago as 1844, and there is one other species, C. incanus, from Sikkim, which has recently crept into gardens. It is a soft, azure flower, its throat beautifully lined with white hairs, rather delicate, but quite happy in a stone trough. RALPH E. ARNOLD.

The Gardens, Moor Wood, Glos.

Judas Tree and Wistaria at Hyfield, Sussex

The amateur status

I shall be greatly obliged if you will enlighten me as to what exactly entitles a gardener to the names "Professional" and "Amateur" respectively.

If, to be a professional, one simply has to sell something, then how many of us who possess a garden can still retain the name of amateur?

There cannot be many people who would not plead guilty to having sold their surplus of a good crop of Apples, Peas, or Plums in a particularly good season from time to time, and probably most of us do the same thing with our surplus plants and shrubs.

Is it simply a question of receiving coin for our goods, or is there some subtler distinction, such as the issuing of a printed list? C. B.

[The Royal Horticultural Society's rulings with regard to an amateur are as follows:—

No person shall be permitted to compete as an amateur who gains any part of his livelihood by growing for sale, or for an employer, flowers, fruit, vegetables, plants, seeds, grafts, cuttings, bulbs, buds, etc., nor any person in the employ of a nurseryman. Any objection raised as to the rightful qualifications of an exhibitor shall be referred to the Council of the R.H.S., whose decision shall be final.

By the words nurseryman and market gardener are understood persons who maintain gardens for the purpose of gaining a livelihood, or intend them to return an annual profit.

Local Societies often desire to separate amateurs into four or more classes, corresponding, roughly speaking, to the following:—

(1) Amateurs employing more than one gardener regularly.

(2) Amateurs employing only one gardener regularly.

(3) Amateurs not employing paid assistance regularly.

(4) Amateurs employing no paid assist
at all.

Whenever any person is recognised by
officials of a Show as coming under th
finition of "Amateur" in their parti
district, and exhibits have been accepte
within their local Show rules, the ju
must make their awards without discus
those rules. The duty of deciding wh
and who is not, an amateur in any p
cular district lies with the officials of
Show, and not with the judges.]

The proposed Rock Garden Socie

I notice in your issue of June 22nd a l
suggesting a Rock Garden Society, and
six years' experience of such a Socie
hasten to say that a national one at h
would be of world-wide interest, and fron
start success is assured. Members woul
procured from every centre of the globe,
so I trust that the letter from Sir Wil
Lawrence, Bt., will bear results.

I think I am safe in stating that I fo
the first Rock Garden Society some six y
ago for New Zealand, and it was so gr
success it was impossible for me to go on
the work, so had to leave it in other ha
Membership grew so fast it was impos
for one to cope with it, and so is now in h
of a stronger Centre, and was transferr
Wellington. The possibility of interch
of ideas would help members from all p
but the big exchange of seeds and p
from all parts, with its headquarter
London, would be of great value, and if
a Society formed, I would willingly org
collection of seed from New Zealand–
even Australia.

So I trust that your valuable paper
throw in its weight to get such a Sc
formed. A. WILKINSC

Nelson, N.Z.

Notes from a Cornish garde

FIRST the Primulas. P. Florinda
pears to be the latest and is a trifle
appointing, for the size of the leave
me to expect something more showy i
way of flower; but the plants are seed
and may improve next year; moreover
drought may have had something to do
the matter.

On the Primula bank a seedling
Reidii has distinguished itself, for it has
splendid stems with six bells open on on
three on the other, and is really very lo
especially as it is about 5 feet up the
and therefore at a convenient height fo
spection. Also one of the stems is taller
the other, whereby one gets the full b
of the two.

Desfontainia spinosa, which is like a m
ture Holly, but with long, tubular, y
flowers, has done well in good soil in a s
place, and one or two cuttings put in
years ago are making good growth.

Last year's cuttings, chiefly Rhod
drons, failed in a measure, thanks to th
tentions of moles, so that this year I
put them all in pots in the hope
although these hold fewer, the percenta
survivors may be higher.

A friend, met at a garden party, was ta
away cuttings of Eucryphia pinnatifolia
from what I read in Mr. Bean's book h
scant chance of success with them.
ago I was fortunate enough to raise se
of E. cordifolia, but that was probab
fluke, as M. Chenault told me that his
had never succeeded with it. E. cordifo
magnificent this year, the parent plant
35 feet high, and one of these raised fr
cutting about 25 feet, both being covered
flowers from the top downwards. They

a sheltered slope facing north, and I have
to cut off their lower branches since they
encroaching on the old plant of Rhodo-
dron auriculatum. E. pinnatifolia is
oming but sparsely, being in too shady a
ce, owing to Rhododendrons and two
antic Cupressus Lambertiana, and is
king nothing like the show of one seen
other day on the borders of Devonshire
lmost full sun.

oheria populnea is again flowering pro-
ly, which means, I presume, that it will
flower next spring. It is an erect,
der, graceful shrub about 12 feet high,
long, narrow, serrated, evergreen leaves
clusters of pure white flowers in their
s. So pleasant a thing that I have put
uttings of it, especially as it stood last
ter without turning a hair, and must be
dier than is supposed. Here it is thriving
dryish place and in partial shade.

a late issue of GARDENING ILLUSTRATED
nolia fuscata was mentioned as a green-
se shrub, which set me looking at mine,
ift many years ago from Mr. Reginald
rer. It is growing in heavy loam in a
er shady place, and is now almost 12 feet
. Last winter it suffered not at all and
its inconspicuous, sweet-scented flowers
sual in the spring. It is evergreen, with
ow, shiny, leathery leaves and an upright
t, and since it is hardy here in north
wall should be worth a trial further
h.

ydrangeas of various sorts are in full
m, iron in the soil and partial shade
ing hortensis and Mariesii very blue. Of
other H. hortensis var. Veitchii, with
llish white flowers and blue anthers, is
of my favourites, and H. Lindleyi, with
ially fertile flowers and the sterile ones
pink, and white on the same corymb,
re to attract attention.

merous Rhododendrons are out again.
Cunningham's Sulphur, the white-
red adenogynum, and the curious fawn-
red hybrid between caucasicum var.
nineum and apodectum among the
r-flowered varieties, most of the lapponi-
and saluenense series, and the white
alanthoides.

stly, in one of the frames a first flower
. Valentinianum, and a lovely thing it
lear pale yellow with numerous red
ls on the exterior on a dwarf plant, with
ng, ovate, hairy leaves. If it turns out
quite hardy this should be a plant with
ure.

d now one may take count of one's yet
tched chickens in the shape of Rhodo-
ron buds for next year. There are several
ese on new hybrids and two or three on
species here, so that one has something
k forward to even if the flowers do not
ually materialise.

ars ago I visited Kilmacurragh, and de-
d thence with an introduction to Sir
. Moore. To him I mentioned the
er of self-sown seedlings I had seen
, and he replied that it was because Mr.
and his sister did most of their own
ing. How true it was I have proved
and again, getting, moreover, some
nice plants in the process.

ey say that the Musk is losing its scent,
marked a seedling which appeared in
all garden last year, thinking that this
ne of the isolated spots where the scent
survive. Shortly afterwards came the
n boy and weeded, and it was no more.
this year another came up between
ig slates near the greenhouse, and again
rastinated, with the same result. Later
rd arrived on the scene, and that I
y potted up and put in the greenhouse
it is strong enough to go out with a
label attached. And now in a Rhododendron nursery far down the drive a fresh seedling has appeared, and near it a plant of Rubus parviflorus var. Fraserianus. This is curious, for though Mr. Fraser, of British Columbia, sent me seed two years ago, it is odd that one of them should have got down there and germinated.

Some time ago the President of the Royal Horticultural Society wrote to me about Farrer's Caryopteris, which, I believe, is tangutica, and asked how it should be propagated. At the moment I could only reply that one plant had layered itself, but since then two seedlings have appeared in the gravel in front of the house. One fell a victim to the garden boy, but the other I moved in time and planted out in one of the nurseries, where already at 9 inches high it is well set with flower-buds. And this is satisfactory, for the two old plants have died and it would be a pity to lose it altogether.

"PETER THE HERMIT."

Rhododendron Edgworthii

I AM sending a photograph of the Rhododendron Edgworthii here in case it might interest your readers. The shrub is certainly 20, perhaps 30, years old, and has always been out in the open, though in a sheltered position. It flowers freely every year and was unaffected by this year's frost. It has grown so tall now that it has overtopped its stake. I am wondering whether the branches will stiffen and become self-supporting, or whether we ought to try and make them climb the trees and bushes on either side. Perhaps one of your readers could tell me.

Rhododendron Edgworthii

Is it self-supporting?

Y. J. GAISFORD-ST. LAWRENCE.
Howth Castle, Co. Dublin.

Zonal Pelargoniums for winter

In the wide selection of greenhouse plants there is probably nothing comparable to the old-fashioned Zonal Pelargonium for colour when well done and grown purposely for the bloom during the dull winter months. At that period this plant is essentially a country one—I mean, persons in or near places where fogs prevail may find flowers decay or drop quickly, particularly the single sorts, which, to my taste, are more showy and altogether choicer-looking than the doubles. Colours among the former, too, are really the more brilliant. To get satisfactory specimen plants one must think well ahead. This, indeed, should be the case in the culture of every garden subject. To start with, spring-rooted cuttings should be selected, not that those rooted the previous autumn would be useless, but on account of their size. I like winter Zonals in pots no bigger than 48's or 5-inch, and the latter would require pots a size larger to flower in. Having first procured or grown the small plants, they would at once receive the only repotting. The soil employed is loam with a 5-inch potful of bone-meal to a bushel. This compost is simple, and it is one that assists a firm rather than a gross growth, for these plants make too much leafage as a rule. Or, rather, it is easy to obtain undesirable growth by using manures or leaf-mould. Pot firmly, keep the plants under glass in a cool structure until the end of May, when they may with safety be placed in the open. A sunny position should be selected. A favoured one is along the sides of garden walks, standing the plants on boards. Against such is the amount of time required in watering in hot weather, and therefore it is better to put them in a batch by themselves with the pots plunged to the rim in ashes. Here the calls for water are not nearly so frequent, and all one does is to turn the pots on occasion to prevent the roots going through into the ashes and growing too freely. Give each plant quite a square foot of space.

Summer treatment consists, besides the necessary watering, of topping back any growth which seems to be getting away from the rest, and in keeping the bloom buds pinched off. This last item is regularly done, and no buds are allowed to develop before about the middle of September. At the end of that month the plants go to a light part of a greenhouse. They are raised on the stages by standing them on inverted flower-pots, and the plants have stimulating additions to the water each time this is given, in a weakly state being the rule, anything with ammonia prevalent—as soot-water and liquid from farmyard manures—suiting admirably. Were one to select a powdered form, Peruvian guano would be favoured. The trusses of bloom last a long time in winter and early spring. At that time, too, the pips of these are not so liable to drop as they are in summer. Decayed ones are picked off, and, as remarked, other buds which follow on the same truss keep the display going. For years it was the rule to purchase named varieties, but in my own case a few seedlings are raised annually. By doing this I have got together quite a nice collection—good enough, in fact, for the expert—most varied in shades of pink, cerise, scarlet, and so on. Maybe we do not find Pelargoniums in winter so prominent at exhibitions as formerly. Trusses of bloom of the rounded or florists' class used to be a feature at the November shows; but still a few growers in the trade keep their named sorts to date, besides raising others.

C.

The Rose order

To prevent disappointment at planting time, the Rose order should now be made out and despatched to the favoured nurseryman so that the plants may be sent immediately they are ready. To delay this important matter until the planting season has arrived is unfair to the dealer, not to mention the likelihood of disappointment to one's self, fine opportunities being often lost simply because of the delay in ordering. During late October and throughout November the opportunities for planting are not numerous, so it is well to be prepared to seize any such that may occur.

A Day's Plant-Hunting in the Balkans

By DR. ROGER SMITH Illustrated by THE EDITOR

STARTING from Belgrade on June 11th we drove to Nis, and having drawn a botanical blank on the mountain of Suva Plana we crossed Serbia and approached the town of Pec (Ipek) in Montenegro across a vast plain, out of which the mountains of Montenegro and Northern Albania rise abruptly, and at last we felt we were approaching real Alpine regions. Pec is a very picturesque, but very dirty, Turkish town, full of mosques, with their tapering minarettes, and the streets filled with the most wonderful mixture of races; Turks wearing the fez and their women folk closely veiled, in spite of Constantinople's repudiation of the fashion, and pretty little Turkish girls in their baggy trousers and wooden pattens; tall, lean, slouching Albanians, with their minute white skull caps; Montenegrins in baggy blue knickers with red cummerbunds and rakish little, round embroidered caps; and in contrast to these the Vlacks, probably descendants of the original inhabitants of these parts, both men and women dressed entirely in black. Here, too, one saw the powerful water buffaloes, surely the most miserable-looking animals ever seen, drawing heavy waggons. Our first duty on entering the town was to call on the head of the gendarmerie and state exactly where we wanted to go, and what we wanted to do. We made this a regular rule, and we invariably found that the police were very polite and ready to do everything in their power to help us; in fact, all through our tour we received the very greatest kindness from the officials, and they went out of their way to further our plans.

We were anxious to climb Kopravenik, a mountain some 9,000 feet high, lying to the north of the town, but the police would not consent to our going without an armed escort, so at 4 a.m. the next morning we set off with two smart soldiers and a porter, and after climbing up beyond the tree zone the flora became very pleasing. Here we found Forsythia europæa, the only European species of a plant that is otherwise found only in China, and here also Syringa vulgaris, the common Lilac. It was interesting to see growing wild this shrub that is so universal in cultivation. Growing on the lower slopes were Symphytum tuberosum, only a foot high, and bearing yellow bugles, and Aristolochia clematitis climbing over the bushes and displaying its curiously-formed yellow flowers. Amongst the tall grass the Scorzoneras were very attractive. We found rosea, purpurea, and the yellow and brown hispanica. Onosma echioides made wonderful splashes of colour amongst the rocks, as also did Onosma pallidum, the flowers of which are a pale lemon. Erythronium dens canis was plentiful and must have made a carpet of colour earlier in the year, but almost all the flowers were over. Ranunculus nyssanus, with its golden flowers on foot high stems, was found, and the tall, large-leaved Ranunculus platinifolius, and in the shade of the wood the dainty, bright orange-flowered Anemone ranunculoides.

Of Gentians, the rare dinarica was here the prevailing form of acaulis, verna var. æstivalis and asclepiadea were plentiful, and the rare Gentiana Knobskii was found, not yet in flower. High up on the sho of the mountain, on an exposed rock. discovered Ramondia serbica in full bl a truly lovely sight, and close by the Geum balcanicum, with immense leaves pale yellow, drooping flowers, a very cl plant indeed. As we got near the su ridge Saxifraga scardica appeared, a ma dancing, snow-white flowers on red st and this plant followed us plentifully fo rest of our journey. One of the party covered a few plants of Wulfenia carinth tucked away under the shade of an overh ing bush, but careful search failed to r any more. We saw across a small vall mass of pure white flowers springing fr crack in the rock, and raced across to Saxifraga Spruneri, very near to Scar but with smaller, more tightly packed le Near the top of the pass, at 8,000 feet, fraga thessalica was found, and one sol plant of Saxifraga Griesbachii var. m negrensis. Edrianthus Kitabellæ was g ing plentifully amongst the higher r As we reached the pass, the rain, threate for some time, came down in torrents, we were a very wet party that crawled the tedious descent, but a very cheerful as we were well satisfied with our day's

HUGH ROGER-SMI

Planting bulbs

Daffodils, of course, ought to have got in some weeks ago, but should thi have been overtaken get them plante once, so as to give them at least h chance. Spanish and English Irises sh now be got in, while such kinds as Ch doxas, Scillas, Snowdrops, Winter Aco Crocuses, Dog-tooth Violets, Darwin Cottage Tulips, and Leucojums, also cinths and other kinds, can all now planted with perfect safety.

New plants from the States

he weather of late has suited plants from parts of the United States, and there are umber of interesting things in flower at moment.

he first is Brauneria pallida, which is h like a Rudbeckia in appearance; the florets are, however, a delicate pink and toothed at the point. As soon as the er is expanded the rays lie back round stem to make up a strange but attractive er.

uellia occidentalis is a Michigan plant h occurs on the Pine "barrens." In earance and colour it is very like Conulus Mauretanicus, but the flower is e tubular.

lox mesaleuca is a very attractive plant, narrow grey foliage and large and solid ers, pink above and dead white on the rse. If it can be propagated, this plant ld be a valuable addition to so-called ne Phloxes.

ster Kumleini is a dwarf Aster of Aster mpsonii type. It only grows about 10 ces high, and we are trying to cross it one of the Aster amellus varieties with iew to raising a dwarf large-flowered ety.

hanostephus Skirrobasis is a plant in th rather like Dimorphotheca pluvialis, ying dazzling white Daisies with bright buds, the colour remaining on the backs e ray florets.

e Californian Sages—Audibertia—are ing very large plants. One variety, A. , has beautiful silver-grey foliage. Unnately, they show no signs of flowering will not survive a hard winter.

Ihave been very much interested in the at which I received, I believe, from the John s Institute under the name of Pentstemon eziesii. This has grown very well and ed a good mat. It has now flowered, the flowers are smaller and a little deeper lour than P. Scoulerii. There has always much doubt about these plants. My view is that P. Menziesii is the type and P. Scoulerii is a natural hybrid. At the time it must be remembered that P. lerii occur wild, both in the violet and vhite form.

WILLIAM LAWRENCE.

Geranium grandiflorum

The title of this hardy Cranesbill is one which holds out the vision of larger flowers than those of its kinswomen, but this is hardly borne out in the plants themselves. The flowers are large, however, and whether or not we agree with the title, we are bound to admire the plant itself when in bloom. When introduced a few years ago it came quickly into demand, especially by those who owned rock gardens, to whom it was specially recommended. It was soon found, however, that it generally became too tall, and heights of about 3 feet were not uncommon, while some plants raised from seeds varied in size and shade of colour. This has, to some degree, militated against the value of G. grandiflorum for rock gardens, as numbers of these features are of comparatively small extent, and a plant of its height does not consort too well with the minute gems of the Alps, which are the special treasures of the rock gardener.

A much better form for the purpose of the rock garden is one which was introduced through having been in the well-known garden of Mr. W. Robinson at Gravetye Manor, and was first distributed by Messrs. W. E. Th. Ingwersen, Ltd., under the name of G. grandiflorum, Gravetye Variety. It has been found, however, that this plant is G. grandiflorum alpinum, and is a most distinct subject, admirably adapted for the rock garden. It is about a foot high in many cases, but in autumn it grows rather taller, and it is at present about 18 inches with the writer. It flowers well in early summer, lasts for a good period, and this autumn has come into bloom again and is giving a considerable number of its large, open, fine blue flowers. It is one of the exceptionally good plants of the genus, and, when better known, will be found in many places, either in the borders or rock gardens. It is increased by division and produces seeds, but I do not know whether it comes absolutely true from these, or whether it varies. It likes sun, but can do with a fair amount of shade. No special soil is required for its cultivation.

R.H.S. Autumn Show

A random commentary

THE second half of the autumn show was very different from the violent and almost garish brilliance of the first part. The New Hall, as one looked down on it from the dais, was a green glade, lit here and there by richly coloured berries and the soft colours of a few late-flowering shrubs. It made you think that, if there was a common fault in modern gardens, it was a tendency to be too floriferous and full of colour. We acknowledge this tendency when we admire the restfulness of old-fashioned gardens, for 100 years ago the gardens were full of very leafy plants and their restful quality was due very largely to their greenness. Nowadays we have encouraged our garden plants to become more and more floriferous, and the herbaceous border achieves its latest development in a riot of pyrotechnic brilliance. That is one side of gardening; on the other we have a very large number of shrubs, new and old, which are being appreciated, not only for their varying tones of green (green, after all, is a colour, even in the garden), but also for their beauty of design and the richness of their berries. There were berries of all kinds at Greycoat Street, from the bright blue sausages of Decaisnea Fargesii and the turquoise beads of Viburnum Davidianum to the scarlet droplets of the deciduous Barberries. But, though giving the exotics their full due, there were few of them as strangely beautiful as our native Spindle Tree, with its challenging but triumphant combination of cerise-pink and orange, and the airy poise of its berries on their olive-green twigs. It was shown on many stands, and everyw
it seemed superior to its foreign relat
such as Euonymus Yedoensis and its v
ties. The deeper-coloured E. europ
fructu coccineo and the white-berried
are chiefly of value in association wit
The Cotoneasters are many in number,
all have in common a firm and de
beauty of design which is enhanced i
bullata, C. rugosa, and C. salicifolia by
channelled veining of the leaves, and
have now the added magnificence of cri
or scarlet berries. The Hawthorns wer
presented by the large-fruited species,
as Cratægus crus-galli (with immense th
like a cock's spur), C. mollis, and
orientalis. The last-named has ora
rugose fruit as large as a Cherry, and a
them were so impressive that it is a pity
they are not seen more often in gard
where they can so well replace the stri
confectionary-coloured Pink May.

Elsholtzia Stauntoni
An outstanding flowering shrub at the Autumn Show. Flowers in purple spikes

In the centre of the hall and, as it w
in a clearing in the wood, there was a s
tinted Heath garden, which brought out
value of the many varieties of Heather w
Messrs. Maxwell and Beale have bee
pains to bring together. It might seen
first rather precious to collect and nam
many slightly differing varieties of Ling
Bell Heather, but their value becomes
parent at once when we make a Heath
den. If we put down in the garden a p
of the unmixed species its colour seems
appointingly thin and washy, since we
the gradations of tone that distance and
inequalities of the ground give to the
sweeps of Heather on the moors, and
just this effect of life and shading tha

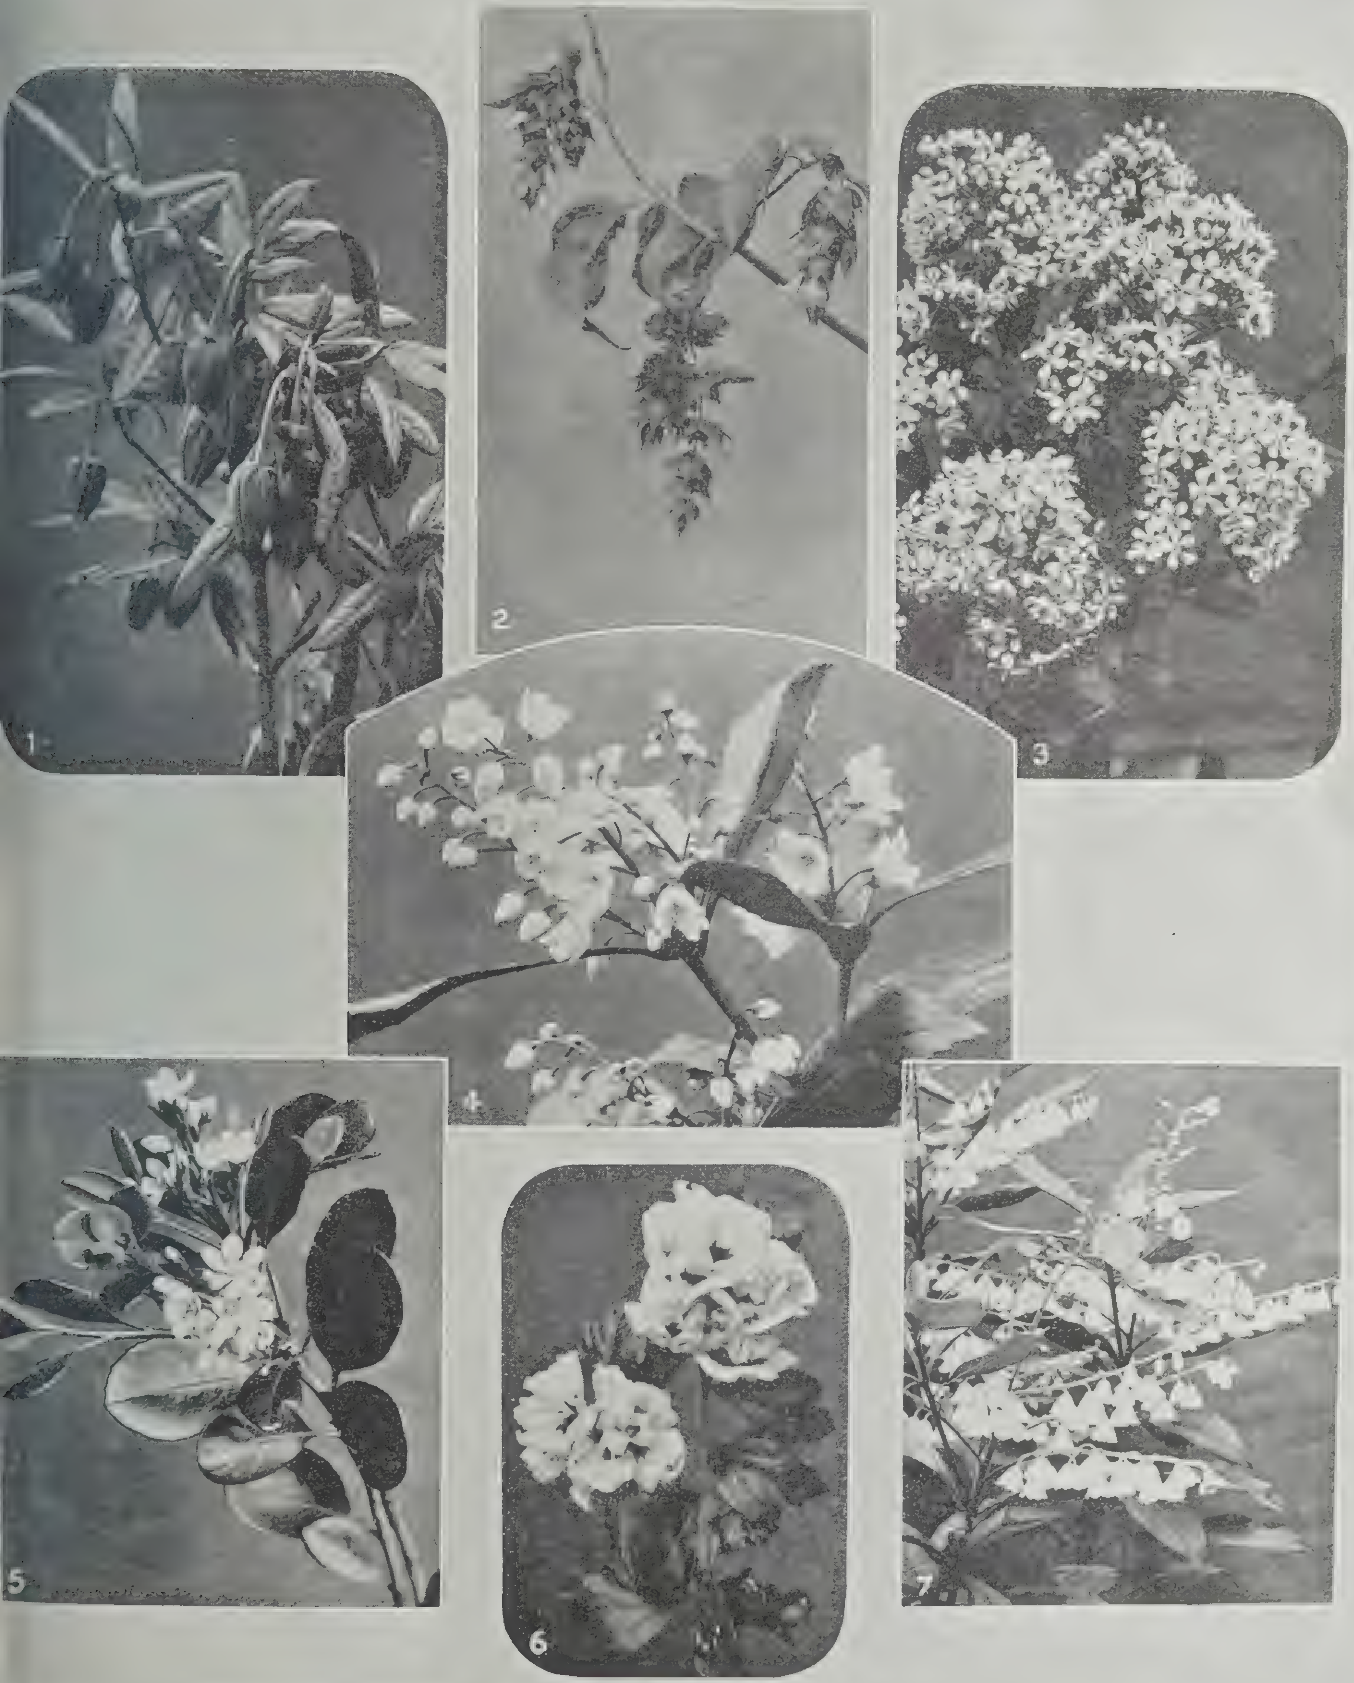
FLOWERING SHRUBS AT THE AUTUMN SHOW



LATE FLOWERING SHRUBS IN A RIOT OF PYROTECHNIC BRILLIANCE

1. Tricuspidaria Hookeri (syn. T. lanceolata) flowers like glowing crimson lanterns.
2. Leycesteria formosa.
3. Escallonia montevidiensis.
4. Anopteris glandulosa.
5. Raphiolepis japonica (syn. R. ovata).
6. Hibiscus syriacus.
7. Clethra arborea.

Erica cinerea carnea, lilacina, and atropurpurea, and Erica vulgaris Alporti and others.

Of the later-flowering shrubs Ceratostigma Willmottiæ was shown rather sparsely and not very effectively. Perhaps the severe winter tried it rather hard, but although it is not of iron hardiness, plants that were cut to the ground by 20 degrees of frost are now covered with gentian-blue flowers on 3-feet stems, and when the leaves presently turn colour will be showing that combination of copper-brown and blue which is almost unique in garden plants. Caryopteris Mastacanthus gave a quietly pleasant effect of misty lavender and grey, but it is a pity to call it a "Blue Spiræa." Bœninghausenia albiflora made a welcome appearance in several exhibits. It is a charming little plant, like a delicate, grey-leafed Thalictrum with milk-white flowers, and it is, perhaps, only on account of its preposterous name that it is not seen more often.

At the end of the hall there was a superbly exotic outbreak, where, in Mr. G. Reuthe's exhibit, Lapageria rosea swung its raspberry-pink trumpets over giant Rhododendrons, Brugmansias, and the soft yellow of Cassia corymbosa, with every assurance of perfect hardiness. In the Old Hall autumn tints were reproduced by Chrysanthemums in brown and madder, and in the sombre, reddish-purple of Echinacea purpurea (of which Messrs. Gavin Jones showed a fine, broad-rayed form under the name "Letchworth"). Messrs. Isaac House showed off the frilled elegance of Scabioas caucasica, which strikes the eye as an admirable flower for the house and as a typically feminine one—an epithet used here without the smallest derogatory intention—but the difference between the various forms seems scarcely to justify the number of names. The new hybrid Colchicums are handsome great things, and in some of them the checkering of the smaller species is faintly appearing, and this good beginning of hybridisation in a genus hitherto neglected by the florist gives promise of still better things to come. H.

An impression of the Autumn Shrub Show

By Sir William Lawrence, Bt.

THERE is no doubt that the drought had handicapped exhibitors and, curiously enough, had produced very little autumn colour. Further, there is so little sap in the branches this year that cut sprays last badly. The Barberries are not ripe, but, as Mr. Bean remarked to me, the Show was of the highest value from an educational point of view. It was possible for Fellows who were planting shrubs to select, for example, the different coloured fruiting Mountain Ashes and the like: Pyrus Pekinensis (orange), P. Vilmoriniana (cyclamen-pink), P. aucuparia munda (white). Then there were the Firethorns, Pyracantha Rogersiana flava (bright yellow), and Yunanensis (orange-yellow). There were too few Cratægus, and there are so many fine ones—for example, C. Arnoldiana, C. submollis, C. Jackii, C. punctata. Whilst Pyrus Aldenhamensis is best in flower, Pyrus Eleyii beats it in fruit.

Mr. Reuthe showed many rare plants, including a lovely vase of Lapageria rosea and Guevina in full flower, and there was little to choose between Notcutt, who had the richest show of berries; Wallace, with good Rhododendrons; and Cheal, with a particularly well set-up group and nice baskets of Crab Apples.

Messrs. Hollamby had their vines very well arranged, and vines with coloured foliage are difficult to show. Mr. Allgrove must be congratulated on his very fine exhibit, and it was marvellous to be able to bring up trees without shaking off the fruit. There were some very good groups from Ireland, and the Heaths and Clematis brightened up what would have been rather a sombre show.

On the other hand, the Old Hall was a blaze of colour, and has never looked better. In my opinion brightly coloured flowers look best in the Old Hall, and less gaudy flowers, such as Roses, Sweet Peas, and shrubs, in the New Hall.

The attendance of Fellows and their friends at this important show was disappointing. Nurserymen were complaining that they did not take enough orders even to cover their show expenses. It must, however, be remembered that it takes time for people to get used to new arrangements, and further, that many visitors who rely on the R.H.S. Gardeners' Diary failed to notice the errata slip which sets out the revised arrangements. (It has taken the public a year to find their way in numbers to the new restaurant.)

Caryopteris Mastacanthus

Gives a pleasant effect of misty lavender and grey

The specialising in shows of classes of plants is so desirable in itself that it is to be hoped that the experiment will be repeated next year. If it still continues to be unsatisfactory from the point of view of the horticultural trade it must, of course, be given up, when the only alternative appears to be to have a second Chelsea Show in the autumn.

LIST OF AWARDS

October 2nd and 3rd

GOLD MEDAL

G. Reuthe, for shrubs.

SILVER-GILT FLORA MEDAL

J. Cheal and Sons, Ltd., for trees and shrubs.

Caryopteris Mastacanthu

AS shrubs that flower during Sept
and October are very few, Cary
Mastacanthus makes a very va
plant for the garden. It is a deci
small shrub, growing from 4 feet to 8
height, and of a spreading habit. The t
flowers are of a bright violet-blue, pr
in hemispherical cymes from the axils
uppermost leaves, the main flower-sta
ing ¾ inch to 1½ inches long.

A native of China, it grows wild
Canton, while it is also common in So
Japan in fields, rocky places, and c
mountains. When first introduced int
country it was treated as a greenhouse
but was eventually lost, and reintrodu
Maries in 1880. Since then it is found
very well outside in open, sandy soil a
a south wall, where it appears pe
hardy, while in a few favoured locali
will succeed out in the open, particul
a well-drained position.

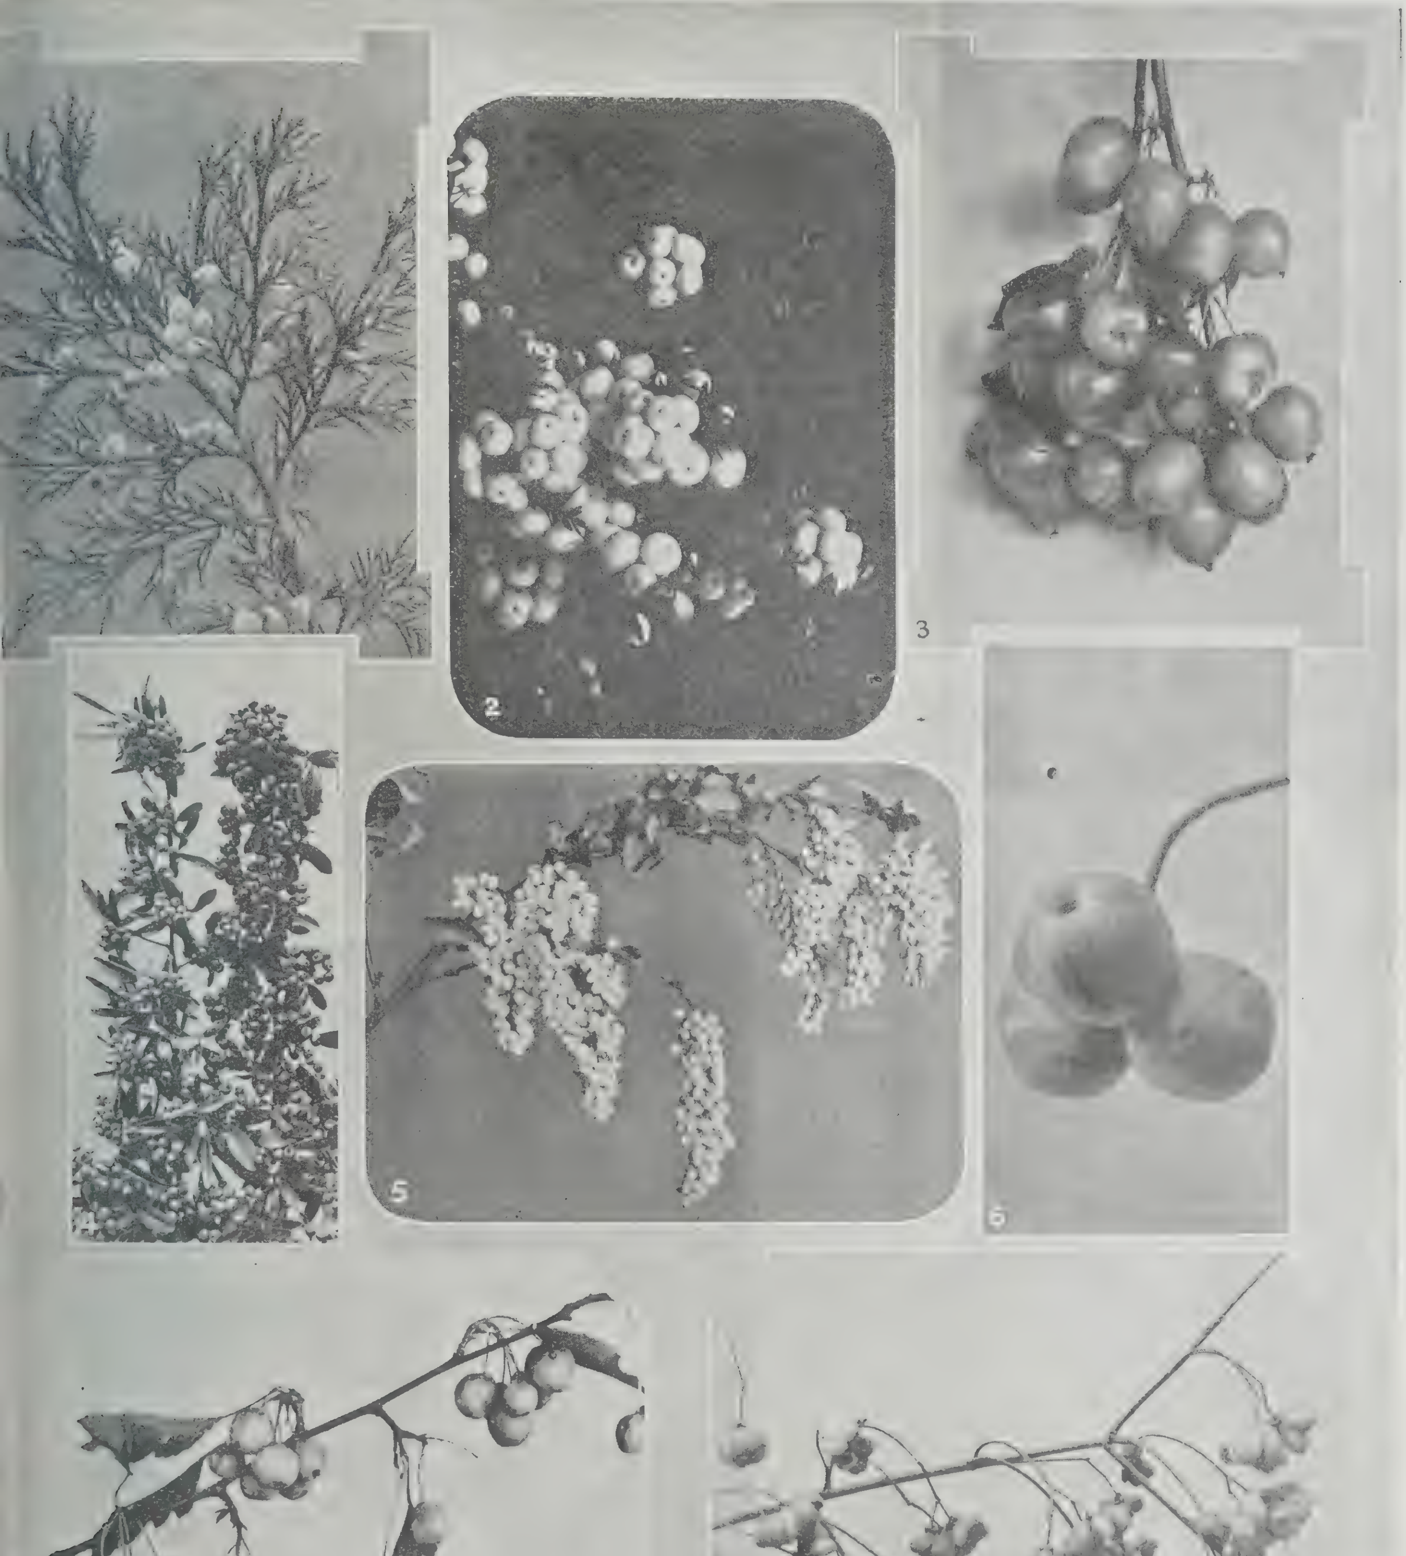
After it has flowered in the autu
should be pruned back almost to the pr
year's wood, the flowers being borne
new growth. It is increased with the
est ease by means of half-ripened cutti
sand in a frame. The young stem
semi-woody, covered, like the flower-
leaf-stalks, and the underside of the
with a close grey felt.

Another species recently introduc
Caryopteris tangutica, equally as attr
but flowers quite a month earlier.

George H. Prest

University Botanic Garden,
Cambridge.

FRUITING SHRUBS AT THE AUTUMN SHOW



ORNAMENTAL FRUITS AND BERRIES OF MANY KINDS AT GREYCOAT STREET

1. Juniperus virginiana Keteleeri.
2. Pernettya mucronata.
3. John Downie Crab.
4. Pyracantha angustifolia and P. coccinea Lalandii.
5. Berberis polyantha.
6. Japanese Quince on Cydonia.
7. Pyrus toringoides of the Malus section; fruits small, yellow and red.
8. Our native Spindle Tree, with its challenging combination of cerise, pink, and orange.

Rose Cottage Maid or Rosa Mundi

Old Roses

Will anyone be so kind as to tell me when the following old-fashioned Roses were first introduced into English gardens?

Blush Gallica, Celestial, Maiden's Blush, Duc d'Angoulême, Mme. Plantier, Blairii No. 2, Louis Odier, Roses des Peintres, Lucida Plena, Kazanlik, De Meaux, Coupe d'Hebé, Cottage Maid, and Old Red Damask.

Most of the above I already possess, and the rest I hope to get this autumn. These old-world Roses give me such joy that I long to know more about their history, and I thought perhaps that some of the readers of Gardening Illustrated, who possess old gardening books and magazines, might be able to give me some information.

M. R.

[The history of the old Roses covers a wide and interesting field, and a full answer to " M. R.'s " inquiries would take up a great deal of space. I append a few details taken from notes and books at my disposal, but I have no doubt that other readers may be able to supply more.

Many of the old Roses for whose date of introduction " M. R." inquires belong to the great period of activity in raising new Roses at the beginning of the nineteenth century, of which Laffay and Vibert were the most outstanding workers.

Some of the Roses belong to earlier periods in which the records of garden plants were both scanty and vague; and it has been impossible, unfortunately, to explore all the sources of information necessary for a full reply to " M. R.'s " inquiry, but it is hoped that it will be possible to supply at least some of the deficiencies later.

Blush Gallica.—Origin not traced, but probably at the end of the eighteenth century. It is listed in Sweet's " Hortus Brittanicus," 1826.

Celestial (Rosa alba group).—Untraced, but probably of English origin. Listed in Sweet's.

Maiden's Blush (Rosa alba group).—Kew, 1797.

Duc d'Angouleme (centifolia).—Holland. Date uncertain.

Mme. Plantier (Rosa alba hybrid).—Plantier, 1835.

Blairii No. 2.—Climbing Bourbon. Blair, 1845.

Louis (Louise?) Odier—Bourbon Margottin, 1851.

Roses des Peintres (centifolia).—Origin untraced. Eighteenth century.

Lucida Plena.—Veitch, 1884.

Kazanlik (R. Damascena).—This is the variety grown at Kazanlik in Bulgaria for the production of attar of Roses. It is probably of recent introduction under this name.

De Meaux (Dwarf centifolia).—Untraced; probably end of seventeenth century.

Coupe d'Hebe (Bourbon).—Laffay, circa 1840.

Cottage Maid (R. Gallica).—Origin untraced. The name appears to date from the beginning of the nineteenth century, but the Rose was known earlier as Rosa Mundi, and is figured under this name by Miss Lawrence (1799). It is not, I think, identical with the Rosa versicolor of Clusius.

Old Red Damask.—Recorded in 1575, but it is one of the very old Roses, and is probably coeval in English gardens with R. centifolia.—F. A. H.]

Climbing Roses

These are, in many instances, making very strong shoots, which must be constantly looped in, otherwise when swaying during storms there will be a tendency towards their supports being pulled down.

Some good old Roses

" W. F.'s " note in a recent is
Maréchal Niel is most interesting, an
me back to my early days, 50 to 6
ago. Having grown it then in man
tions I can endorse all " W. F." says
gard to pot culture. The finest bl
have ever seen were budded on s
Briars. Some old light soil was use
the loam in which these were plante
plant being put to each of the pillars
the centre border of a large span
orchard-house. They soon made
shoots, and the second season many o
were from 20 feet to 30 feet long.
gave enormous blooms, and when seen
ing down were a glorious sight. Ea
son the old shoots were cut back, an
were made to produce good flowers for
years by giving them a dressing of n
every season, although as time went o
fell a prey to canker. My experience
this Rose gives the best blooms fro
young wood, and I agree with " W. F.
we have nothing to equal it for colo

Everlasting Flowers

HE immortelle of the East (Helichrysum orientale), a native of
Asia, has been known in Europe
ce 1629, but was only first cultivated
gardens about 1815. Its flowers,
symbols of friendship, or tribute to
ent and genius, serve to make the
rlands of immortelles which orna-
nt the tombs of the dead in Roman
tholic countries. It is cultivated in
ance, in the communes of Lower
ovence, where the soil slopes towards
Mediterranean. . . It blossoms
out the month of June. It suffers
m heavy and continuous rains and
ong dews, and only vegetates well
light, stony, and permeable soils.
is propagated by offsets, which are
arated from the old stocks. The
hering of the flowers is made in the
t days of June, before the bursting
the buds. . . The collection is made
women, who tie them in small
ndles, which are ordinarily dried on
walls of the enclosure. Finally,
ng girls are employed to remove
down which covers the ramifica-
ns. . . .—March 15th, 1879.

Veronica salicifolia

shrub is known as the Willow-leaved
ca. The foliage, which is at all times
ive, is evergreen and the flowers are
hite. The racemes on which they are
are about as elegant as anything that
be conceived. The shrub is beautiful
practically the whole of August and
ber, and is very easy to cultivate. A
ich soil must be provided. I find that
ell to work a good bucketful of farm-
anure with the soil around the roots.

y specimens came unscathed through
en frosts of last season. No pruning
ired at any time save that of removing
oots which are too weak to produce
. Planting should commence in early
ber. This will give the roots an op-
ty to become established before the
winter sets in. G. H. C.

Harrogate Autumn Flower Show

With Lord Brotherton presiding, the North of England Horticultural Society's Autumn Show was opened by Lady Barran in the Winter Gardens, Harrogate, on the 25th ult. There was an exceptionally fine exhibition, the arrangement being different to other years, as the tables and stands in the centre of the hall were placed across instead of lengthways down the centre.

Messrs. Dickson and Robinson took the Challenge Cup with a display of Dahlias embracing all the sections. While not so extensive as last year, the exhibit included some magnificent blooms.

Messrs. Dobbie and Co. again showed their Orchid-flowered Dahlias grouped in one mass with a border in front of other contrasting varieties.

Roses were extensively shown, and, considering the weather, were good. Mr. Thomas Robinson, of Nottingham, had the finest display, with blooms of good quality tastefully arranged. A group of Dame Edith Helen and Etoile de Hollande occupied the centre with Christine, Mrs. H. Stevens, Miss C. E. van Rossem, Florence Izzard, and Dainty Bess on one side and Christine, Margaret McGredy, Mrs. A. R. Barraclough, Mme. Butterfly, K. of K., and Mrs. H. Morse on the other. Messrs. Samuel McGredy and Son also had a well-arranged display with a centre composed of Margaret McGredy, McGredy's Ivory, and Mrs. A. R. Barraclough, with Los Angeles, Cherry, McGredy's Scarlet, Lady Leslie, Irish Hope, Admiration, and Diadem on either side.

W. and J. Brown put up a splendid group with Polyantha Roses as background, and Dame Edith Helen and others displayed. Several other firms showed fine Roses in smaller groups. Messrs. Mansell and Hatcher, Ltd., had a large Orchid exhibit.

At the end of the hall Messrs. G. Gibson and Co. displayed Roses on arches, herbaceous flowers, Palms, and Ferns. Messrs. Kent, Brydon, and Haigh had masses of Asters and a Gold Medal vegetable exhibit in the annexe. Messrs. Daniels Bros., Ltd., had fruit of excellent quality. The Rev. C. Gallacher's small exhibit of Gloxinias and seedling Begonias were much admired. Rock work was shown by Messrs. Backhouse, H. H. Maw and Son, and Mr. P. Gardener. There were several exhibits in the annexe, two of Gladiolus and a number of herbaceous flower displays, one of which included a June-flowering Iris in full bloom.

Congratulations are due to the Acting Secretary and his supporters for worthily upholding the reputation of the North of England Horticultural Society's flower shows, so long managed by the Rev. J. Bernard Hall, to whom a testimonial is being subscribed. C. A. J.

Rose Mme. Plantier

REMINDERS FOR THE WEEK

Southern and Midland

Bush fruit

The planting of all kinds of bush fruit may now be commenced, and, providing the ground has been well prepared beforehand by trenching and enriching with farmyard manure, this early planting will prove of immense advantage, as the newly made roots will take hold of the soil at once. This will enable them to break strong and go well away in spring. Bushes planted late in spring do not get sufficiently established to withstand a period of drought.

Fruit trees

Most kinds may be lifted and transplanted now, even although a few leaves remain upon them. The stations intended for the trees must, however, be prepared in advance so that the latter may be replanted straight away. The positions for Apples, Pears, Plums, Apricots, and Peaches should be well drained, trenched 3 feet deep, and filled in with good but not unduly enriched soil. After planting, a good soaking of water is advisable, and where possible a light mulch should be spread over the surface to encourage root action.

Figs

These do not require quite so great a depth of soil, providing there is a fairly good surface spread for their roots, 2 feet 6 inches being ample depth. Like all the stove fruits, they should be provided with a fair proportion of lime-rubble in the soil and be given very efficient drainage. Young plants put out now should be given a little protection during severe weather. Established specimens of Figs transplant very badly, and I would advise the use of young stock in preference to them always.

Herbs

Gather a few bunches of those herbs which are in demand during the winter months and dry them by suspending the bunches from roofs of cool, airy houses. The herb garden should then be cleaned and the soil loosened up. In some instances it should be slightly enriched, as even herbs cannot go on for ever on the same land without a little assistance.

Autumn Broccoli

Veitch's Autumn Giant, Walcheren, and others are turning in, and as a precautionary measure against frost and to retain whiteness a few leaves should be broken over each flower early. Remove all decaying foliage from late crops of this estimable vegetable and also from Brussels Sprouts, Borecoles, and Savoys, as not only is such unsightly, but often most offensive.

Winter Onions, Lettuce, Corn Salads, and Spinach

Keep the soil moved with the hoe frequently among these very important crops as long as it is possible to do so and keep weeds from making progress between the plants.

Plant houses

These are now full to the brim, as are many fruit-houses from which the fruit has been cleared. Watering in all cases should, so far as possible, be carried out in the morning in order that the floors may become fairly dry before night. This is especially important where plants are in bloom.

Cyclamens and Primulas

Those showing bloom should be assisted with periodical waterings of weak liquid-manure as these plants bloom over a considerable period. The same applies to winter-flowering Begonias, which are now becoming very effective and develop richer shades of colour when assisted as above. During their flowering period a temperature of 50 to 55 degs. at night, with a little opening in the top ventilators will be found suitable.

Carpeting shrubs, Roses, and ornamental deciduous trees with plants

Such work may now be carried on under ideal conditions. Polyanthuses look well beneath Purple Plum Trees (Prunus Pissardi); hardy Cyclamen beneath an old Yew or other evergreen tree; Narcissus, Jonquils, and Snowdrops under Beeches and Oaks; Rubus beneath large shrubs or small trees; dwarf herbaceous plants, including Montbretias, beneath and in the foreground of thinly disposed shrubs. Scillas, Dog-tooth Violets, Crocos, and Chionodoxas love the gentle shade and the friable soil of Azalea gardens, and the beautiful Trilliums of North America a cool, shaded spot in deep, leafy soil beneath deciduous Magnolias or on the cool north side of walls or banks of evergreens.

Herbaceous borders

The occupants here may now be lifted where necessary and divided, and fresh plantations made. Plans made for the rearrangement of such borders during the summer may now be put into execution, for, providing the plants are watered in, no better time could be chosen.

Spring bedding

This is now in full swing, but should the weather prove dry such plants as Wallflowers suffer badly unless dewed over with the rose occasionally. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Standard fruit trees

While these do not require much in the way of actual pruning, it is always desirable to look over them carefully each autumn and make certain that no overcrowding of the branches is present, whilst there are often dead twigs, or even branches, which should be removed. In cases of overcrowding, remove the offending branches with a saw and then neatly trim the wounds with a sharp knife or chisel.

Fruit trees on walls

If the time can be spared, there is no better season than the present in which to go over the trees and fasten them securely to the walls, whether this be by tying to wires or by the old-fashioned method of nailing. This latter process is a tedious and unsatisfactory way of doing the job, the work being so much more easy and pleasant when the walls are properly wired. It is easy then to get everything securely fastened in a comparatively short time and thus permit of more time being available for other duties.

Storing Beetroot

Although slight frosts do no harm to this crop, it really gets no benefit from being left out much longer, so on some fine dry day have it lifted and stored in cool yet frost-proof quarters, and where rats and mice cannot get near it, as these destructive pests sometimes do considerable harm if not checked.

Continue lifting Potatoes

As each variety matures, have the crop dug up, graded, and stored. There is always
risk of disease spreading if the tube
left in the ground after they are ripe.
lifting, keep the best-shaped, mediun
tubers for "seed," while the smal
diseased ones should be kept back for
ing to pigs. The rest of the crop,
drying a little, should be stored awa
dark cellar or shed which is fairly d
quite cool, but at the same time safe
frost.

Carrots

The maincrop Carrots, like Beetroot
gain nothing further by remaining
ground, but may be badly split b
autumn rains. If still out, therefore,
them lifted at the first favourable
tunity. As with Beetroot, store in a
fairly dry place, using plenty of dry s
dry, sifted soil between the layers of
and over the top of the heap.

Late Cauliflowers

These promise well this autumn an
quent attention to the plants to afford
a little protection from frost is desirab
soon as a head becomes visible bend
the leaves over it or else gather the
gether and tie the points so as to form
of tent over the "curd." This will
all the protection necessary when the f
light, but should really severe w
threaten, the plants approaching the
stage should be pulled up and hung
downwards in a cool shed, where the
remain fit for use for 10 to 15 days.

Preparing for spring bedding

Where the beds filled with summe
ding plants have to be planted with s
flowering subjects, it will now be well t
the summer occupants cleared off, an
ground manured and dug preparatory
moving of the new plants into their flo
quarters. If it is also possible to p
with the planting, so much the better,
sooner this can be done the better
have the different plants of becomin
established before the winter sets in.

Plants in frames

Should such winter-flowering plan
Cinerarias, Cyclamens, and Primul
still in cold frames it will now be ad
to have them moved to a greenhouse
where a little fire-heat is at comma
keep out, when necessary, frost and to
damp. Do not coddle these plants, an
water with great care. Schizanthus
lings should also be taken to a light s
a house from which frost is excluded.

Propagate Pelargoniums

Both the Zonal and Regal section
now pretty well over for the season, s
tings should be secured and inserted
the edges of 4-inch or 5-inch pots fille
light, sandy compost. If set in an
mediate temperature they will soon
roots, and as soon as they do so the
should be moved to an ordinary green
for the winter.

Watering during winter

Evaporation is now very slight and
plants are resting, so the amount of
required by pot plants is very little com
with what was necessary during the
mer months. To keep the soil sodde
fatal mistake, so water should only be
when it is really approaching the dry
When it does, enough should be gi
moisten the whole mass of earth in th
and then no more until it again be
nearly dry. It is best to give water
the early part of the day. C. BL

Preston House Gardens, Linlithgow

thcoming Autumn Show on October 23rd and 24th

iefly for Orchids and other stove and greenhouse plants

special show will be held on October and 24th chiefly for Orchids and other and greenhouse plants. All amateurs horticultural traders who grow Orchids her ornamental plants under glass are ally invited to exhibit.

iging may be commenced at 2 p.m. on day, October 22nd, and all exhibits be ready for judging by 11.30 a.m. on nesday, October 23rd. The show will at 1 p.m. (or earlier if judging is ed), and will remain open until 7 p.m. evening. On the following day, sday, October 24th, the show will open a.m. and close at 4 p.m.

e Society's Gold Medal, together with Silver Cups and Flora and Banksian ls, will be available for award to non-etitive groups, and the Lindley Medal be available for award for plants of al interest or beauty.

o challenge cups and two silver trophies offered for competitive exhibits of ids staged by amateurs.

W PLANTS, ETC., FOR CERTIFICATE.—The and Vegetable, Floral and Orchid nittees will meet on the morning of the day of the show, Wednesday, October Orchids for certificate must be entered the Secretary of the Committee by a.m. that day, and other subjects must tered with the Secretaries of the ap-iate Committees by 11.30 a.m. . The tific Committee will meet at 4 p.m. on er 23rd.

TURE ON "ORCHID-GROWING FOR INERS."—At 3 p.m. on the first day of how, Wednesday, October 23rd, a lec-on "Orchid-growing for Beginners" be given by Mr. H. G. Alexander, H., who for many years had charge of te Sir George Holford's famous col-n.

Aster Climax

hough this Michaelmas Daisy has been for many years it still continues to rain a fair share of popularity. Belong- the large-flowering or Novæ Belgiæ , it grows, on an average, about high, usually commencing to flower in the Midlands towards the end of nber. Its large, pale, lavender-ted flowers are borne in graceful idal heads on stout stems, which make emely useful for cutting purposes for decoration. We have some 30 or plants in full bloom now, and in spite dry season they do not appear to have ffected in growth or diminished in size bstance.

J. L.

Sempervivum Camollei

pervivum, a genus of complicated clature and a myriad species and es, is a lovely soft grey, gradually pass-o red through pink and rose. Its de-f beauty depends largely upon the position on the rock garden, the ideal rocky, sun-kissed crevice with a deep arply drained soil. Perhaps more ly S. calcaratum, S. Camollei is per-ardy and has been grown since 1874. wers—one does not want it to do so— reddish or brownish-white blossoms ried on 12-inch stems, but the joy of sence is the bunch of fat, beautifully d rosettes, happy-looking and colour- all seasons, if somewhat slow in .

RALPH E. ARNOLD.

Gladiolus as a cut flower

SOME of the many good border Gladioli are now so moderate in price that they may well be grown in the reserve garden to serve as cut flowers. The picture shows a simple arrangement of white and yellow kinds. The white is Giant White, the yellow is Schwaben. Another time it is the same white with the charming pink Marshal Foch and the deeper pink Panama. For suitable foliage to go with them it is a good plan to cut out the central spike of the white striped Japanese Maize when it is about 3 feet high; this also encourages the lower growths of the Maize, which then become handsome foliage plants of moderate height. The Maize was not to be had when the heavy jar of *grès* ware was photographed, and the only accompaniment of greenery was a few small branches of the broad-leaved Laurel. Some tall sprays of Artemisia lactiflora were added; their cream-white colour going well with the massive blooms of the Gladioli.

G. J.

Gladioli as cut flowers

Raoulia australis

This is a splendid plant for a dry, elevated position, for it will withstand heat and drought with impunity. It is worthy of a place on the rock garden, its silvery foliage relieving to a great extent the usual barrenness associated with the dreary season. It covers flat rocks and stones like a silvery Moss, and where it has a modicum of soil to root into, develops into beautiful little grey tufts. The plant has no brilliant flowers to recommend it, but this need not be regretted as it is the silvery Moss and not the flowers that is its charm. In winter it may exist on the level ground, but its true position is on old walls in some earthy or mossy chinks. The plant looks as fresh and vigorous when emerging from some dry chink, where a drop of water seldom falls upon it, as when planted in good soil on raised beds. It will grow on almost earthless mossy rocks, provided a handful of finely broken sandstone is placed about the plants and fully exposed. The plant is best increased by side shoots, which are numerous and root as they go. These may be fixed to the surface of a flat sandstone with sand and small stones, where they will quickly form plants of rich verdure.

H. STEVENS.

Salvia splendens

Often grown in large batches for indoor decoration, these should be liberally fed whilst developing flower spikes and the plants kept in a position reasonably near to the glass. A temperature of 45 degs. to 55 degs. is desirable at the present time.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

VEGETABLES

Celery Leaf Mining Maggot

I am venturing to send some badly afflicted Celery in the hope that your advice may be helpful in the future. This is the third season in which the Celery has been attacked. Last year five rows of very fine Celery went very suddenly. The green tufts of healthy-looking leaves turned brown and dirty-looking, and the stalks quickly decayed. We only had one digging, and remarked what very perfect Celery it was, the best for some years, but after that there was no more fit to eat. All the five rows were dug up and burnt, the soil dug over and left to sweeten during the long, hard winter. This year the Celery was moved to a distant part of the garden and only two rows put in in ground that has never before been used for Celery. It has been very difficult to make it grow at all, owing to the drought, which has been very fierce just about here. The ground was well prepared, and we had a little shower just when the Celery was put in, but weeks of dry winds and hot sunshine have kept it very small and stunted, and in spite of dressings of soot this horrible disease has attacked it very badly indeed, and the poor young gardener is in despair, feeling that he does not know what to do. MARY C. MACKAIG.

Newmarket.

[Your Celery is affected with the larvæ of Celery Fly. With such a bad attack we are doubtful if you can now do anything to save the crop, that is, if they are all so bad as the one specimen sent. We think your best plan would be to lift the crop and destroy it. The site on which the Celery now stands should be dressed with flake naphthalene at the rate of 2 ozs. per square yard and forked in as deeply as possible. Defer the application until the ground is really moist. Another year you should keep your Celery plants sprayed with a good nicotine insecticide at intervals from the time the plants are put out into the trenches. You can alternate the insecticide by dusting the plants over with a mixture consisting of three parts of old soot and one part of slaked lime, the dust to be applied when the foliage is damp. Celery, of course, loves water, and in seasons like the present it is almost impossible to grow the crop without artificial watering.]

FRUIT

Over-ripe Pears

Can you give me any information as to why early varieties of Pears, such as Clapp's Favourite and Jargonelle, go brown in the centre of the fruit so quickly? Is there any means of preventing it, as oft times the fruit looks perfectly sound while the centre is completely rotten? W. M.

[Pears, after becoming ripe, very soon go out of condition, and the two varieties mentioned have a very short season. Early varieties of Pears are probably only in prime condition for about three days; after that they begin to go brown or "sleepy" in the middle. There is, of course, no means of preventing this state of affairs, but you can delay the process by keeping the Pears in a very cool place, taking a few at a time into warmer conditions to ripen. Another plan which helps to spread the ripening period is to pick half the crop a week or 10 days previous to the second half. The first half is picked so soon as the fruit will leave the tree easily, the second half allowed to hang a week or so longer.]

Deformed Apples

(R. V. Stoney).—Your Apples have been attacked by Capsid Bug. The Apple Capsid Bug (Plesiocoris rugicollis) appears towards the end of April. When first hatched from the egg the creatures are small, and resemble Aphides (Green Fly), except that they are very much more active. The creatures run about amongst the developing foliage and fruit, and feed by puncturing the tissue and sucking out the cell sap. In all positions where the creatures feed considerable marking occurs. At first a red or brown mark appears, but as the leaves and fruit develop, it is noticed that the parts surrounding the punctures are dead, and they fail to develop properly. Foliage becomes deformed and ragged, while the fruits are wasted and deformed, such as those you send. After successive moults, the Capsids alter their appearance and become fully winged. Eggs are laid by the adults, but these are laid partly embedded within the bark of the shoots. The best control for this pest is to spray with nicotine, using the following formula.—Nicotine 98-99 per cent., 3 ozs.; soft soap, 4 lbs.; water, 40 gallons. Smaller quantities can be made, provided the materials are kept at the same ratio. This spray fluid is useless if it is not driven well into the developing shoots and trusses. The spray should be applied through a coarse nozzle, and should first be directed downwards into the trusses and leaves, passing from the tip of the branch to its base. Then swiftly turn the spraying apparatus, passing from the base of the branch to the top, thus spraying each branch twice, once downwards and once upwards. Using this method, the bugs which shelter beneath the foliage are trapped in the spray by the upward movement. Many of the Capsids fall to the ground, and these should be sprayed, or they will crawl back up the trees. Nicotine is a contact wash, and can only kill if it hits the creature concerned. The best time to spray is seven days before the flowers open their petals, but in bad cases a second application, immediately the petals have dropped from the flowers, is desirable.

Victoria Plum stock

(R. V. Stoney).—The two small Plums sent for examination are probably Victoria Plums. It is not uncommon for a Plum tree that has had its first crop of flowers killed by frost to produce a few flowers later in the season, and for such flowers to set and swell, producing fruits such as those sent. We think
that this is the true explanation of the
fruits. Have a little more patience, a
think that you will be rewarded by a c
Victoria Plums. We notice that the
sent have been badly attacked by Ca
You will apply the same control as
above for your Apples.

Maggot in Peaches

In a foreign country where Peach
fruit in the open, the fruit is inva
spoiled by maggot. Would you tell me
is due to the Peach Fly or Peach
if it can be combated by arsenical spray
flowering; and if it is possible to make
single spray solution which will destroy
and, at the same time, prevent Peach
Curl? HESPERI

[We cannot be of much assistance t
If you had given the foreign country
cerned we might have been able to fi
something about the pests you mention
tunately, in this country, we are not tr
by Peach Fly or Moth. Peaches, of c
fruit freely out of doors in this countr
pecially when planted on a wall, and w
seen good crops on standard Peach
sheltered districts. Your best plan wo
to write to the Agricultural Advisory S
of the country concerned for the desir
formation. Peach Leaf Curl can be cont
here by spraying with Bordeaux immec
before the buds begin to break into gro

Aphis on Red Currant bushes

(J. A. B.).—The damage to your Red
rant bushes is caused by a variety of
which attacks the under sides of the f
during summer. As soon as they appea
bushes should be sprayed with a soluti
quassia extract, or "Katakilla," eith
which may be had from any nurseryma

Apple Mildew

(W. G. W.).—Your Apples are af
with Apple Mildew. The best plan w
for you to cut away and burn all the
dewed shoots during winter pruning;
shoots have a whitened appearance in
winter. When the buds break into grov
spring you should look over the trees, re
and burn all the mildewed buds. Spray
lime sulphur at the "pink bud" stage
Apple Scab, and if the mildew shows
signs of spreading, repeat the spray whe
petals have fallen.

Removing branch from Mulberry

(H. C. L.)—This may be done immed
the leaves have fallen, and if cut off w
saw it will be advisable to trim the w
off carefully with a sharp knife, as the
leaves a rough surface. Paint the wound
with Stockholm tar afterwards.

Diseased Nectarines

(James Dean).—The Nectarines
affected with Brown Rot. The fruits s
be removed from the tree and used for
ary purposes or destroyed, but on no ac
should you leave them in the house.
probable that the variety would do bet
you could give it rather warmer treat
especially in the earlier stages of growt
this is impossible, crop the tree lightly
few seasons. From the smallness o
fruits, we judge that the tree carrie
many fruits. Give the tree a dressing o
phate of potash at the rate of 1 oz. pe
yard early next spring.

GREENHOUSE

Primula and Cyclamen Maggot

(G. J. W.).—The specimens you sen
the larvæ of a weevil, probably that o
Black Vine Weevil. The adults appe
spring and feed upon the foliage of va

house plants. Eggs are laid upon the of many plants, but Primula, Cyclamen, Ferns are especially favoured. When the gots appear they feed upon the roots of lants until the following spring. We do know of any insecticide that can be ed to pot plants which would control the Trapping the adults in spring seems the most successful control. Pieces of acking laid about in the houses form traps because the weevils feed by night shelter by day. At this period most of dults have disappeared, but you should a sharp look-out for the pest in May June when egg laying takes place. Ex- ation of the plants at night with a light generally reveal the culprits. The only ment when the pest is in the maggot is to repot the batch of plants, after ng out the soil from the roots. This ment is, of course, not always practical. are always laid in the soil, and the gots do not crawl up through the drainhole.

gonium trouble

hn H. Butter).—The foliage of your gonium (Geranium) has been damaged creature, probably Begonia Mite. Care- arch of the specimen failed to show any of the culprits, but they would be likely ive the plant during the period in the If only one plant is affected it would st to destroy it, but if the trouble shows sign of spreading, you should apply ur by means of a Campbell's Sulphur riser. Any check to the growth of the renders them more liable to serious

ese Sacred Lilies”

ing noticed in a shop window some abelled “Chinese Sacred Lilies” for shall be glad if you will please give the name of this Lily and directions for ivation. “BARTONIAN.”

Chinese Sacred Lily is an eastern of Narcissus Tazetta (N. Polyanthus), also known as the Joss Lily. Bulbs im- from Northern China can be had in six weeks from planting. Half fill a vith shingle, adding sufficient water cover this. Place bulbs on the shingle rround with pebbles. Keep receptacle lark until growth begins, then transfer light It is advisable to change the weekly, and the same should be tepid. e pebbles can be purchased from most erchants, one quarter being sufficient e bulbs.]

Diseased Galtonia

(H. W. Daltry).—We have examined your specimen Galtonias and can find no trace of a fungus; the bulb and disc are perfectly sound. The foliage and flower spike have failed because the roots have gone. Insect attack on the roots of the plants seems to be the sole cause of the trouble. Exactly what the culprit was we cannot say, because we have no evidence beyond the destroyed root. Millepedes may have caused the trouble. A good soil insecticide applied now would drive away the pest, and should do no harm to the plants at this stage of their growth. If there is any sign of the trouble extending, try and find out actually what is eating the roots.

Naming the Pansy

(W. Deacon).—The Pansy, being raised from seed, has really no name, this plant rarely coming true when so raised. You can, therefore, name it yourself, if so disposed! The Chrysanthemum flower was much damaged, so it is difficult for us to say just what it is, but it might be Mary A. Houston.

Rock plants for southern aspect

(Yokel).—Zauchneria californica, Thymus serphyllum coccinea, Onosma Taurica, Linum salsoloides, Lithospermum prostratum, Heavenly Blue, Linaria pallida, Helichryssum bellidioides, Campanula carpatica pallida, C. Warleyensis, Æthionema grandiflora, Aubrietia Lavender, Eriogonum umbellatum, Aquilegia glandulosa, Arenaria montana grandiflora, Veronica Bidwelli.

CHRYSANTHEMUMS

August-flowering Chrysanthemums

(Regular Reader).—The Chrysanthemum bloom sent is Lichfield Purple. Some good August flowering Chrysanthemums are:—Maggie, Lizzie McNeil, Pluie d'Argent, Charles Blair, Elstob Yellow, Walter Day, Afterglow, Cranford, Crimson Circle, Diana, Mary A. Houston, Mrs. A. W. Thorpe, Mrs. Phil Page, Phœnix, Ronnie, Saracen, Shirley Bronze.

Chrysanthemum Fungus

(Interested Gardener).—Your plants are attacked by what is known as Chrysanthemum Fungus. It is not at all easily dealt with. You should, however, pick off all the badly affected leaves and burn them. The plants could then be sprayed with sulphide of potassium (half an ounce to a gallon of water), which should check it spreading. Caprice du Printemps is a bush variety; Berta is a Japanese variety, best grown as a bush; Godfrey's Eclipse is an Incurved, and Peace is a large Japanese. We do not know H. B. Marsham.

ROSE GARDEN

Diseased Rose

(M. Neilson).—Your Rose is affected with a Crown Canker, which seems to be identical with that present in the specimens received from “Rose,” mentioned on page 669 of our issue for September 28th. The whole of the tissue around the point of union between stock and scion is dead, and it appears rather hopeless to expect them ever to recover. Probably your best plan would be to clear them out and start afresh. Incubation of the material has failed to produce parasitic fungi, and it does seem probable that something has happened, other than disease, especially as the plants seemed to have made good growth earlier in the year. Has the bed been dressed with anything?

Rose Caterpillar

(Brutus).—The specimen Rose leaves have been attacked by the caterpillars of one of the Rose Sawflies. It is now too late to do much in the way of control, but you should spray another year so soon as you can detect the culprits, using a good insecticide containing nicotine, or one of the non-poisonous washes. Both types are frequently advertised within our pages. All prunings should be burnt, because the winter period of the Sawfly, we think, is passed in the pith of the Rose wood, towards the tip of the shoots.

Transplanting dwarf Roses after one year

(L. Knox).—Such Roses are rarely seen at their best the first year after planting, and unless you have a special reason for transplanting them to a fresh position, we advise you to leave them where they are, always providing that they are doing well. No ill effects should result from transplanting, except that growth will not be so strong next season. If they are not doing well in their present position, then transplant them by all means to deeply trenched and enriched soil. In such a case, transplanting would prove most beneficial.

TREES AND SHRUBS

Name of tree

(J. Shipley).—The fruit you send is that of the Whitebeam (Sorbus aria), a very handsome native, both in flower and in fruit. The Service Tree (Pyrus Sorbus) has pinnate leaves, composed of 13 to 21 leaflets.

Preserving Beech leaves

Could you tell me how long Beech leaves which have been picked when turning colour should be kept in a mixture of one-half water and one-half glycerine to absorb the same before being taken out? After once having absorbed the mixture after the necessary time, can they be put in vases without any water or mixture? E. E. R.

[The most that is needed is a 12 p.ct. solution, or, say, one part glycerine to seven parts water. Soaked only, they should remain in a fortnight or more. The trade method is usually to boil them in the solution, or bring up to nearly the boil and leave so for two or three hours. They can then be quickly rinsed in clean, cold water as rapidly as possible, merely to remove surface stickiness, without weakening what has been taken up by the fabric. They are then dried off in air for an hour or two. On no account put water or anything else into the vases. The treatment is to preserve the leaves or sprays in a supple condition, akin to fresh cut, but remaining supple without being in water.]

MISCELLANEOUS

Hop manure for Roses and Potatoes

(Yokel).—Yes, this is quite a good manure for both, and may be used generously for digging into the soil; it is also beneficial to most crops, and for all classes of trees and shrubs.

A bare lawn

My tennis lawn is crowded with Dandelions and Daisies and is very bare in places. The trouble is due, perhaps, to the abnormal summer weather we have had this year, and I shall be glad to have your advice as to the best and least expensive way of treating the lawn so that it will be ready for play next spring. Would you recommend weeding and seeding, or the laying of new turf? J. W. BOWMAN.

[When a lawn gets into the state described by you it is almost hopeless to try and get it back into condition by weeding. You could expend quite a large sum in labour trying to get out the noxious weeds named and in a couple of years it would be almost as bad as ever. The same sum spent on renewing the lawn would go a good way towards paying for this, and if properly carried out would be permanently satisfactory. The work, however, would have to be carefully done and the new turf of good quality and quite free from weeds. Some of the expense might be avoided if the work could be carried out now and fine lawn grass seed sown. If properly done it should be playable next summer.]

Marestail

(Mrs. E. Fairholme).—This is a troublesome weed to deal with, and only by constantly persecuting it can it be got rid of. During autumn all underground roots and stems should be dug up and burned, while next season as soon as growth appears every point should be pulled up or else cut with a hoe under the surface. Repeat this whenever a point shows, and in time the cure will be complete.

Weed killer

I have been told that the following is excellent for killing weeds on pathways. Please tell me if it would be dangerous for my dogs or for birds? Water pathways with 1 in 100 of carbolic acid, and next day water with powdered sulphate of copper or else sprinkle it over the pathways at the rate of 1 lb. to 100 square feet of surface. G. B. M.

[We do not think that dogs or birds would be likely to pick up either of the above ingredients, but, of course, both are poisonous. We have no experience of the treatment, but should you use it we should be glad to hear your opinion as to the result. If you do not care to risk it, why not use a non-poisonous weed killer? There are several on the market, and details are to be found in our advertisement columns from time to time. Powdered kainit will kill weeds with broad foliage, but has no effect on grass-like foliage.]

NAMES OF PLANTS

Percy Leonard.—Your plant is Centaurea aurea, and we can only suggest that seed of it was accidentally introduced with the Night-scented Stock. It is a native of Southern Europe, hardy, and has been occasionally cultivated in English gardens since 1758. It flowers best in a hot, dry summer like the present one.

H. E. Arthur, Near Dorking.—Your plant is Cannabis sativa (the common Hemp), and probably introduced with Bird-seed. It is only annual, and may even reach 20 feet in suitable soil and a long, warm summer. The plant is distinctly ornamental, but the greenish flowers have no beauty. It belongs to the Nettle family and provides the Hemp-fibre of commerce. It is occasionally grown in gardens for its sub-tropical effect.

K. G.—1, Pyrethrum (Chrysanthemum) uliginosum; 2, Aster multiflorus; 3, A. puniceus pulcherrimus; 4, A. Novæ Belgiæ Marguerite; 5, A. Novæ Belgiæ densus; 6, A. Novæ Angliæ Precocité; 7, Saponaria officinalis fl.-pl.; 8, Helenium autumnale grandiflorum; 9, H. a. cupreum; 10, Senecio tanghuticus; 11, 12, and 13 are colour forms of Montbretia crocosmiflora, impossible to name from the wilted specimens.

R. B., Norfolk.—Fuchsia macrostema var. gracilis.

Bethune.—Polygonum amplexicaule.

A. T. F., York.—6, Euonymus japonicus argenteo-variegatus; 7, Picea alba (White Spruce).

Inquirer.—Helenium Riverton Beauty.

J. A. Jones.—Hippophæ rhamnoides (Sea Buckthorn).

G.—8, Arabis aubretioides; 9, Helenium Riverton Gem; 10, Solidago nigaurea nana; 11, Veronica spicata alba; 12, Aster Novæ Angliæ Wm. Bowman; 13, Hele pumilum; 14, Heliopsis scabra.

NAMES OF FRUITS

W. G. W.—A, B, and C, Cellini Phillips' Seedling.

A. A. G.—Apple Lady's Finger.

F. E. S.—Ananas (Anis) Reinette.

Regular Reader, York.—Pears: Williams' Bon Chrétien; 2, Marg Marrilat; 3, Louise Bonne of Jerse Bishop's Thumb; 5, Easter Beurré.

F. R., Bexley Heath.—1, Gasc Scarlet; 2, Duchess of Oldenburg; 3, Derby.

W. C., Salop.—1, Pear Beurré Har rotten; 3 and 4, not recognised, poor mens.

X. Y.—The Apple with russet dots o yellow ground is King Harry.

E. W. D.—Pears: 1, Pitmaston Du 2, Louise Bonne of Jersey; 3, not recog 4, General Todleben.

R. E. B., Bovey Tracy.—1, Reine Caux (Dutch Codlin); 2, Minchall C good old variety of the Bramley typ Mannington's Pearmain (fine specime Reinette du Canada.

A proposed Rock Garden Society

The Roses of 1929

HE summer and autumn of the present year have brought out some remarkable points in many Roses little known, as as emphasising points in others which already suspected.

I am not sure whether Mr. Pemberton ne died knew what a fine variety his ice was going to make, but, like Ruth, past summer has proved Bernice to be riety of sterling worth, a strong, free ning Rose, good to look at, and good nell. A shade of w, flushed with a grower good ny garden.

next discovery 1929 is Julien n. I knew this e a good Rose e the present nner, but never ased that this addition to the gt yellows was g to eclipse them for this is what n Potin is going c. It is not fault- s no Rose is, but e all the other ws it has no ius fault so far as n discover. pared with the s of this colour, s much more gous than Mabel e or Florence d, larger and erect than tine, does not ack like Golden em, is sweet- ted like Golden n, and is a shape than all em. What are ults? Its single so far as I can s that its colour t always quite so deep as Mabel Morse. e past summer has been very active to out the apricot shades of Roses, thus deeper shadings of Mrs. Barraclough been very marked; indeed, many people have discovered this Rose during the season, for it has been better than ever. vira Aramayo, I Zingari, Cuba, and neth Jones have each been resplendent g the past summer, and many people orgive their weakness of shape or form, der to secure their wonderful colourings ermilion and orange or Indian reds. Chas. P. Kilham, although not quite so bright, is a better shape.

Despite all that is said in favour of scent, the majority of people probably still select Roses for their colour in preference to scent, or Briarcliffe would not have been overlooked as it has been. Briarcliffe may also be added to that small select list which last a week in a cut state, challenging the position even of Dame Edith Helen.

Duchess of Atholl, Comtesse de Castelleja, and Mrs. G. A. Van Rossem are all of the orange flame and vermilion shades so well found in the smaller but equally deliciously scented Angele Pernet. Lady Forteviot also belongs to this class and may surpass them all for exhibition.

For those who like the very full type of flower, Jules Gaujard, a new French variety, may be mentioned; its colour is brilliant carmine red, shading to reddish carmine, quite distinct to any other. On the other hand, those who think that Mme. Butterfly and Ophelia are the nearest to the ideal, will find Lady Sylvia and J. C. Mensing, which are deeper pink sports of these varieties, have been superior this summer, as the sun does not have the effect of making them washy. Indeed, it is likely if a poll could be taken of every type of Rose-grower, from amateur to professional cut flower growers, Lady Sylvia would be head of the list as the most ideal Rose. Under trial this summer, among all the deep cerise Roses, Lady Mary Elizabeth comes out as the best. This is still somewhat of a new variety, so many of the readers of GARDENING ILLUSTRATED will yet make her acquaintance, but for a combination of size, colour, shape, or flower and its habit of plant in its free blooming capacity, I believe this variety is first.

In giving an unbiased opinion of a Rose, I always remember that a woman's opinion is usually best, and for this reason must not forget that the single Dainty Bess won at the Rose Show for table decoration. Personally, I think Isobel a more lovely single, but the pair of them have done well this summer.

Man's choice in preference to all the above would likely fall upon a dark Rose, and the past summer has been one of demonstration that we have some wonderful crimsons. Souvenir de Alex. Bernaix seems to have revelled in the drought and sun; so, too, have Lord Charlemont, Bedford Crimson, Chateau de Clos Vougeout, and Hadley.

This being not a review of new Roses, one must not forget that the past summer has proved that some of our old favourites are best still. I heard someone say last year that old Mme. Abel Chatenay seemed to be deteriorating; if that were so, she must have taken a fresh lease of life this summer, and has never been better. Mrs. Henry Morse and Rose Marie have been consistent through-

Approach to The Warren, Hindhead, the home of Mr. and Mrs. Kirby

These buildings, formerly stables, have been cleverly converted by their owners into a cosy cottage. The gable ends are creeper-clad, while arches of Roses and screens of Roses are used to good effect to the left and right of the buildings out the summer as the two best bright pinks. Readers of GARDENING ILLUSTRATED who made the acquaintance of Rose Marie through this paper should remember it when its beauty is enjoyed in the garden, for it is seldom, if ever, seen at the shows, and must be grown to be appreciated.

It is likely that many may be forming a Rose garden this autumn and have made their own notes, but those who have not may rely on every one mentioned as best in its colour. No well-planned garden will omit its climbing Roses, and these form such a large class that they must be dealt with on a separate occasion. A. SWALLOW.

Grease-banding fruit trees

The operation of applying grease bands was recently alluded to in our query columns, but we would like to remind our readers that the materials required for this work should be ordered forthwith. The work can be carried out towards the end of October, and should certainly not be delayed beyond early November. Grease-proof paper should be tied firmly on the tree in such a position that the female moths cannot crawl under. When cutting the paper to fit around the tree, allow enough to give a good overlap, otherwise when the sticky material is applied, the paper pulls apart at the joint.

Another trouble is that if the "grease" is applied cold it is difficult to apply evenly. This can be got over by standing the tin containing the material in a bucket of boiling water, keeping the water hot long enough to thin down the material, which can then be applied easily with a paint brush. Used this way, far better results can be obtained, and the "grease" goes much further.

If the fruit trees are staked, the stakes should be banded as well as the trees. When trees have only very short legs, the soil can be pulled away from the collars and bedded round with straw, which prevents contamination by soil. We find that, as a rule, Winter Moths emerge rather earlier in the season from cultivated land than from grass, and, this being so, the work of banding should commence on the cultivated land and finish up with the orchard trees.

The use of grease bands is solely for the control of Winter Moth. The females of this group, being wingless, crawl up the stems to deposit their eggs around the s Grease bands have not the slightest c over Sawfly, Codlin Moth, or Tortrix b such creatures are fully winged and i case do not appear during the winter, t their eggs after the grease bands a moved.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

The National Carnation and Picotee Society

I REGRET very much that Mr. A. E. Amos in his second note in GARDENING ILLUSTRATED on October 5th, 1929, does not adhere strictly to the truth; perhaps he has been wrongly informed. As he only became a member of the Southern section in 1924 he can hardly be expected to have much knowledge of his Society's affairs, in spite of his 23 years' horticultural experience.

In the Annual Report and Year Book of the Southern Section Mr. Amos will find in 1924 and 1925, the Northern Section was referred to in the subscription list and as an Affiliated Society. In 1926 we find National Carnation Society (Northern Section) in the list of Affiliated Societies, and in Subscribers' List, Northern Society, evidently the thin end of the wedge. In 1927 we find both are Northern Carnation Society. I am afraid we are not used to these methods.

Our Society was named National (Northern Section) on the suggestion of a member of the Southern Committee, and was proposed at our first meeting by a member of the Southern Section, but letter headings have always borne our name as National Carnation and Picotee Society, Northern Section.

Mr. J. L. Gibson refers to us as Northern Section in his book, and Messrs. Lowe and Gibson in their catalogue of 1925 refer Society and exhibition as Northern Secti

Our affiliation fee was paid at the r of the Southern Section, and our was to help that Society, not for any we received, as the certificate we are *sup* to receive can be purchased at half-gr more for the fee paid; I say supposed, be for 1928 and 1929 no certificate has received by the winners.

The most laughable part of this spondence is that a week or so ago, in for our affiliation fee, I received the receipt form, printed National Carnatio Picotee Society (Southern Section).

The objects of our Society are to enco the cultivation of the Carnation, parti the Border Carnation, and to promote will and horticulture generally. We d desire a big bank balance, no honora are paid to anyone, and all funds are de to the benefit of our members.

Our name is, National Carnation Picotee Society, Northern Section. address, 11, Longley Avenue, Sheffield.

WILFRED SECKER,
Hon. Secreta

Pileostegia viburnoides, an effective autumn-flowering shrub
Flowers and buds white, borne on cream-coloured stems; leaves like those of Skimmia. Shown on October 2nd by Gerald W. E. Loder, Wakehurst Place, Ardingly, Sussex

Rose Fortune's Yellow at Hartley

I see in your issue of October 12th, 696, "J. C." in his article on some goo Roses, mentions Fortune's Yellow Ro having been grown by a friend of his lived in Hartley Row, Hants. I think friend must have been my father, Walkinshaw, who lived at Hartley Gr That particular Rose tree must have quite forty years old when I had to take i owing to decay and other blemishes set in in its old age. I think I am rig saying that it was grown from some which were given to my father by Fortune, as they were well acquainted i good days in China. I remember one E many years ago, my mother decorating somewhat ugly pulpit in Hartley Row Ch with nothing but blooms of Fortune's Y Rose, and she was very proud of the fact there were 555 blooms, truly a wond sight. FRANK WALKINSHA

Street Farm House,
Bramley, Basingstoke.

Honeysuckle in fruit

In my garden a decapitated Fir tre covered by a magnificent tangle of Ho suckle. For the many weeks during w this is in bloom, it is a joy to the eye, the scent, especially in the evening delicious.

In past years, as soon as the blossom over, the clump was a favourite haun bullfinches, which feasted on the ne formed berries.

Whole families, father, mother, young ones, spent most of their time th They were charmingly tame, and one c watch them whilst standing only a few away.

I congratulated myself that though I joyed the company of the bullfinches in ner, they seldom visited the garden in er and spring, and they did little or no ge.

st spring things were changed. Bull- es seemed to be unusually numerous, they worked havoc in garden and ard. In spite of being covered with thread, my Gooseberries suffered badly. branches had every bud taken and had cut away. Heavy toll was taken also of n, Pear, Lilac, and Pyrus japonica. In a garden which adjoins my own, and in h much fruit is grown, war was declared e bud-eaters. The gardener shot every nch which appeared. They are an easy !

is summer I missed the little visitors to Honeysuckle. But what a change is !

e whole clump is covered with heavy hes of crimson fruits. Never have I seen neysuckle so laden. Decked out thus, one of the most showy fruiting plants ble. All the same, I would willingly o the autumn display for the sake of irds, though I won't deny that the bull- is an enemy to the fruit grower.

B. C. T.

Cyananthus lobatus

as interested in Mr. Arnold's note (issue er 12th, page 688) on the above plant. visiting the Rock Garden at Kew in iddle of last month, there was in flower l-grown plant of C. Delavayi in one of at beds, and I also noticed C. lobatus in , but the latter was of a pale violet , fading almost to white, and this in no allies with the description given to it as an blue. Despite its smaller flowers, elavayi appeared a very much more g plant. During the summer I chanced Mr. Puddle from Bodnant in a train a niles from Tal-y-Cafn on his way to n, and he unpacked for me a parcel ning a very well flowered plant of C. ri which he was taking up to one of rtnightly shows of the R.H.S. The ption given by Mr. Arnold much more approaches C. Farreri than the only of C. lobatus I have seen, none of lants having yet flowered. Seed of nthus Farreri was, I believe, one of the iscoveries rescued and sent home from 's last trip to Burma, which ended so ally in his death, and is a plant which sought after and treasured as soon as omes available to Rock gardeners, not ecause of its associations, but on ac- of its time of blooming and unquestion- eauty.

F. H. FISHER.

ster.

Sweet Peas in autumn

W. E. Wright's interesting article on Peas in the autumn (October 5th) con- a phrase which left me rather in . In writing of the varieties which are discarded, he states: "2LO, nothing in rison with Huntsman, a colour hardly ed." Perhaps Mr. Wright would like plain if Huntsman is to be grown as dly superior to 2LO. or whether both be dropped. The inquiry is prompted se, on my own growing, careful and nt comparison failed to reveal any great nce between the two varieties; colour, habit, and all-round unsatisfactory s classed them as identical, and the pair out of a matter of 30 varieties. will certainly make room for something next year, and the same remark applies ntsman, although I do not see quite eye with my namesake that the colour lesirable; merely a matter of personal of course. I learn from an authoritative source that the 1930 novelty, Allbright, is superior to the two varieties in question.

Darlington. A. E. WRIGHT.

The Cornelian Cherry

A well-fruited branch of Cornus Mas recently shown before the Royal Horticultural Society from the Botanic Gardens, Cambridge. An Award of Merit was given for the showy bright red fruits. Native of Europe, and cultivated for centuries in Britain

Eritrichium argenteum

Can you give me any suggestions for the raising of collected plants of Eritrichium argenteum? This is, I believe, a sub-race of E. nanum, of the Alps. L. B.

Cincinnati.

[We have no information of Eritrichium argenteum, and can find no mention of it in any available book of reference. If, as our correspondent suggests, it is a sub-species of E. nanum, collected plants will prove a hopeless proposition. It should be remembered, however, that the Eritrichium of the Alps is a lime-hater, and that some of the best results in a Continental lowland climate are achieved by growing this plant in a mixture of finely chopped Sphagnum Moss and very sharp sand or granitic chips. Shallow pans would be the best receptacles, and water must be applied most carefully during the resting period, and until the collected plants have begun to form new roots. At the best, we can only hope that collected plants will linger for a year or so and give a few pallid flowers only, instead of the marvellous deep sky blue one sees in the Alps.]

Strawberries: Old varieties *versus* new

The Strawberry thrives more markedly in some districts than it does in others, but from force of circumstances most of us have to endeavour to produce a crop. It is apparent to me that many of the more modern varieties are much less satisfactory—even in gardens in which Strawberries succeed—than the older varieties. They appear to lack stamina and to be deficient in vitality. Percentages of losses when young runners are put out are much too high, and blanks are, in spring, much too conspicuous. In addition, a great many of the newer Strawberries are liable to attacks of Leaf Blight and other diseases to which the older sorts were, if not entirely immune, at least much less susceptible. I am very strongly of opinion that the older stocks of, let me say, Sovereigns, Laxtons, Paxtons, Presidents, and such like will bear favourable comparison as "doers," as croppers, and as being more healthy and more easily managed—in the average garden and given average cultivation—with any of the new Strawberries.

A SCOTTISH GARDENER.

Raising Dryas octopetala from seed

Would you be kind enough to give me some suggestions on the raising of Dryas octopetala from seed. I sowed seed I had collected last February; it germinated well and I had quite a stock of young plants. These remained quite small for a long time, so I transplanted them in another box and placed them in a cold frame. Nevertheless, they refused to grow, and eventually dried up. The soil I used was very limy (as Dryas invariably grows on limestone—p.h. 8+); I mixed in a large amount of fine dolomitic grit in the original soil and in the soil for transplanting.

Cincinnati. L. B.

[Your Dryas seedlings probably sulked because of the absence of humus, and found your dolomitic grit too sterile to support them in their infancy. There is no difficulty in raising Dryas from seeds, but the seedlings need plenty of plant-food to help them along, and only a modicum of limestone grit would have been ample for their needs.]

Apple Allington Pippin

Apples, in this district, are none too plentiful this year, so that I refer with gratitude to the useful crop borne by Allington Pippin. Opinions are sharply divided concerning the quality of this Apple, but, in my experience, it is a very good dessert variety and, from wall trees, not immeasurably inferior to Ribston Pippin or even to the overpraised Cox's Orange Pippin itself. When well ripened Allington is distinctly good, and it possesses the outstanding merit of being a consistent bearer, even in years when Apples bear indifferently—which is more than can be said concerning Cox's. Cordon trees are very profitable, and, on the Broad-leaved Paradise, Allington succeeds in a very marked manner. A good, reliable Apple.

A SCOTTISH GARDENER.

Physalises

The bright pods of Physalises offered for sale in the late autumn are a reminder that the roots can be planted, and those who value these winter decorators for vases for the home should contrive to find space for some in the garden. Any light soil suits them, and they delight best when they can be planted on a sunny border. The past summer has been particularly suitable for them, and I have cut some well podded spikes from roots which were only planted last November. As the roots roam about a border, it is best to plant them in a bed to themselves as, like Mint, they are apt to become entangled with other plants in a border. It is a good plan to brick round a space where they can be kept to themselves, and then they do not interfere with other things.

P. alkekengi (orange) and P. Franchetti (scarlet) are two of the best. Plants are quite hardy, and no winter affects them. Another way of getting a stock of plants together is by sowing seed in a cold frame in April, and from these plants one may have many that will bloom and fruit the following year, but to purchase roots is the best where only a few are required. W. F.

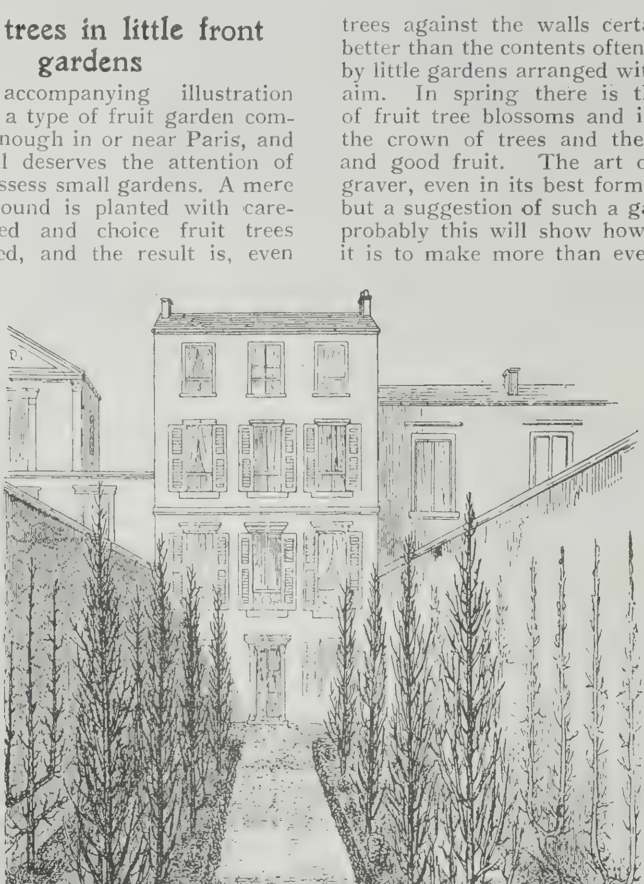
Fifty Years Ago

Fruit trees in little front gardens

THE accompanying illustration shows a type of fruit garden common enough in or near Paris, and which well deserves the attention of all who possess small gardens. A mere spot of ground is planted with carefully-selected and choice fruit trees well trained, and the result is, even from an ornamental point of view, better than it often is where subjects are planted that have beauty only to recommend them. Our view is from a sketch taken in winter of a small garden facing the street leading from Vincennes to Montreuil. Beneath the trees Pansies, Pinks, and other hardy flowers grow; the presence of the trees does not prevent the little garden being made gay with flowers. In winter the graceful pyramidal Pear trees and well and simply-formed Peach and Plum trees against the walls certainly look better than the contents often presented by little gardens arranged with another aim. In spring there is the beauty of fruit tree blossoms and in autumn the crown of trees and the beautiful and good fruit. The art of the engraver, even in its best form, can give but a suggestion of such a garden, but probably this will show how desirable it is to make more than ever full use of our opportunities of planting fruit trees in small gardens. The market distribution of the good things produced by our fruit-growers is so very imperfect that it behoves the owner of even the smallest garden to secure as far as possible his own supply. We may even say that much of the monotonous entanglement now known as shrubbery might well be exchanged in small gardens for well-grown and well-chosen fruit trees.—*December 13th, 1879.*



Nanny Apple

A few weeks ago someone wrote about the Nanny Apple, stating that he had not seen nor tasted that variety for 60 years. I have a very old tree in the garden whic year has borne some very fine-coloured If it will give the person in questio pleasure to see and taste his old vari will send him some if he will let me ha name and address. E. W. Box

The Old House Gardens,
Mickleham, Dorking.

The time to transplant

A question frequently asked is, "W the time to transplant evergreens?" T I would say autumn whenever it is pos When planting is impossible at that se then postpone it until late spring, avoidi winter and February and March. An green should be disturbed whilst the are active, and by doing this in Octob shrub can establish itself before wi hence the object of waiting until spring, autumn has been missed, as root growt again started.

Evergreens differ from deciduous s with regard to time of pruning. Most d ous things can be pruned safely whil buds are dormant, but evergreens of all must be pruned just as growth has s again, with the exception of flowering greens, such as Rhododendron and Ber which should be done as soon as the flow season is past. H. Park

Wroxham.

Orchid-flowered Dahlias

The new Orchid-flowered Dahlias hibited at Southport, Edinburgh, and H gate by Messrs. Dobbie and Co. origi in France just after the war. As the F exhibited them with a mass of foliag very few flowers nobody wanted Dobbie and Co., however, acquired stock, and, by hybridisation and sele greatly increased the number of variet the type.

Originating from a single Dahlia strap-shaped petals which doubled over, character has been maintained with n ous variations. Thus, in and aroun centre, they are open, closed along the l and open again at the tip. This char istic has been developed to the present fection. They need no special culture easy to grow, and supply an abundan blooms for decorative effects. C. A.

Gentiana asclepiadea

This tall and beautiful Gentian Southern and Eastern Europe has long cultivated in English gardens. It g nearly 2 feet high, with erect stems, furnished with shining dark green fol Its large, bright, purple-blue flowers are duced on a third of their length, the ter ones crowded, and the axillary ones, us in pairs, nearly sessile. The corolla is lar and angled, the divisions deeply cut reflexed. The leaves are 2 inches long, lance-shaped, and stem-clasping. It showy plant, of the greatest value for bo and cutting purposes. Owing to the stems being rather brittle and top-hea is advisable to grow the plants in a shel position in order to prevent damage strong winds.

This Gentian is of comparatively culture, delighting in a good, strong loam moist situation. When doing well, it sh be allowed to grow into large plants, and disturbed at too frequent intervals. Alth it is one of the quickest growing speci the genus, it is not advisable to trans too often. When, however, it is desir propagate for the purpose of increase, roots should be carefully lifted and di in the early spring, just as growth mences. J.

Fig Cultivation

N the rich soils of Worthing practically no manure is given (except as a mulch o conserve the moisture), but the ground enerally limed at intervals of two or three rs. Much water is needed, but it must regulated with knowledge; the roots uld not be allowed to become dry during ter, but the main waterings should be de during the growing periods. The sup- s must be regulated with especial care ing the ripening period, or the fruit is le to crack.

s much light as possible is essential, and, he foliage becomes overcrowded, a certain ount of summer pruning may be done. It etter, when adopting the " fan " method, grow the trees in a house with glass sides, with only a very low brick wall. A glar- light is detrimental and the houses should shaded.

igs will stand a considerable amount of t, and may easily be forced; if this is e, as is generally the case at Worthing, ee crops can be obtained every year. The se is started about the beginning of De- iber and kept at a temperature of about legs. Fahr. The first crop is produced on shoots of the past year's growth; and its cess depends on the condition of this wth. It should not be soft, green, or nature, but should be well hardened. If ditions are favourable, picking may com- nce at the end of March, and these first s fetch the best prices in the market. The ond crop is produced on the current year's wth, ripens in May and June, and pro- es the largest quantity of fruit, although quality is less satisfactory. The third crop ich is sometimes removed to husband the ngth of the tree) ripens in July, and ally produces abundant small fruits which h very little in the market.

igs are grown in the open at Worthing bushes, planted from 15 feet to 18 feet rt in ground which has previously been ply cultivated and limed. The ground is t well cultivated and free from weeds, not liberally supplied with chemicals, for rich a soil is not recommended. In some ntations no manure is applied; in others wers apply horse manure every year, ecially when much dead wood has had to cut out and new growth is required. le pruning is attempted, but dead wood superfluous branches are removed.

he trees give two crops of Figs a year, as a rule only the first crop is taken. s crop is produced on wood of the pre- ing year's growth on short-jointed, well- ned shoots. The fruit sets in the spring ripens in August or September. The ond crop sets about August; the fruits w to a small size, but seldom ripen.

ARIETIES.—The varieties of Figs are ex- lingly numerous in the countries where are extensively cultivated. Many of n, however, have not been tried in this ntry, and, as far as commercial Fig-grow- is concerned, the chief variety grown is wn Turkey, with White Marseilles as an sional alternative.

rown Turkey (Brown Naples, etc.).— fruit is large, short and Pear-shaped, a grooved surface; in colour it is brown sometimes a faint purplish tinge on the ny side; the flesh is tinged with red at centre and is rich and sugary. The fruit ns early; the tree is an abundant bearer one of the hardiest. While it forces well, s also probably the best for outdoor ivation.

hite Marseilles (White Standard, etc.).— it is large, roundish, and slightly ribbed; green in colour, becoming yellowish-white when mature; the flesh is succulent, sweet, and rich. The tree ripens well against a wall and forces well.

PICKING AND MARKETING.—The fruits are picked when nearly ripe and packed in trays holding one dozen fruits or in boxes holding four dozen. Extra special fruits are sent to market in shallow wicker " handles " containing four, laid on pink tissue paper on a bedding of wood wool. The first arrivals realise fairly high prices, but this falls as the season advances, and the final consignments realise but a small figure.

Apple James Grieve

This handsome Apple is, without doubt, amongst the finest dessert varieties ever raised. According to some authorities it stands ahead of other varieties for the Midlands and North of England. The tree is hardy, a good grower, and a reliable and consistent cropper. For small gardens, grown in bush or pyramid form, it is certainly one of the best in its season (September and October). The fruit, which is slightly above the average in size and broadly conical in shape, is very beautiful when ripe, the ground colour being lemon-yellow suffused red on the sunny side. The flesh is firm, but not hard, juicy, and possesses a pleasant aroma, to which is added an excellent flavour. From every point of view this Apple can be recommended with confidence. It is a variety equally well suited for both private and market growers. J. L.

Roping Onions

This is congenial work for wet days, and Onions carefully roped and suspended in lines take up far less room and keep a good deal better in an airy shed than when stored in boxes or left lying about on dirty floors, as the air can penetrate to all parts of the bulbs. Onions are a very fine crop this year, and apart from room and cleanliness, a nice rope of them is not without interest when the work is nicely done.

Violets in frames

One sometimes meets with friends whose experience of growing Violets in frames for winter blooming has not been of the happiest, and who, after failure, have given it up as a bad job. They start well in April with healthy runners, and these are planted out in open quarters in good soil, and all goes well until they come to be removed to cold frames in autumn. Then trouble begins. Usually the frame in which they are placed is in a south aspect, because it serves the purpose of quartering other plants at certain periods of the year, for which warmth is beneficial. In the case of Violets, however, no such sheltering position is needed; indeed, it is rather harmful than otherwise, because in autumn, after clumps have been removed to the frame, they are exposed to the sun in October unless steps are taken to shade the lights. If frames are quartered on a north or north-west position, the plants are able to get helpful shade for part of the day, when the lights may be removed and only put on at nights, and then so raised that air can be admitted, both top and bottom. The administering of water to frame Violets is best done early in the day so that superfluous moisture can escape before it is necessary to replace the sashes. This is an important detail which beginners with Violet-growing in frames sometimes overlook, yet if neglected it results in foliage damping-off and mildew following, affecting both leaves and buds. In a mild autumn it may be that the removal of the clumps from open ground to frame is deferred, but by this date the safest course to pursue is to get them under the lights, lifting each clump with what soil is possible, planting firmly, giving water to settle them, and shading from any bright sun for a time until plants have got somewhat established. When finished, the leaves ought to be clear of the glass—9 inches as a minimum—then less damping-off will result. Should mildew appear, dust with flower of sulphur, remove all decaying leaves, and stir the soil from time to time, admitting all the air possible.

A well placed Fig tree over an archway facing south

THE THIRD AUTUMN SHOW

Fruits and Vegetables in the New and Old Halls, October 8th and 9th

A random commentary

THE mere flower-gardener is apt to pass by the fruit and vegetable shows with a certain scornful wonder, an attitude that may sometimes conceal a secret envy of unattainable perfection; for anyone may, with good luck, occasionally grow flowers fit for the show bench, but no amount of good luck suffices to produce the perfection of a "well finished" bunch of Grapes, or the unblemished symmetry of a batch of show vegetables. Yet it is a salutary thing for any gardener to go and see what can be achieved by really skilful cultivation, even though the result may seem uncomfortably and almost tediously perfect.

The Old Hall on Wednesday and Thursday was given over to vegetables, and something of the old tradition lingered on there in the classical exhibits of those gigantic Leeks, Carrots, and Parsnips, which look more like the stage property of a low comedian than edible vegetables. But, on the whole, mere size seems to be dropping out as a criterion of excellence, and a more sensible, practical standard is governing the selection of show vegetables; and there were very few exhibits that made one wish (as one is often tempted to wish at country shows) that the prize-winners should be compelled to eat their exhibits.

The trade exhibits, especially those of Sutton's, Dobbie's, and Barr's, showed us not only how the ordinary vegetables should be grown, but reminded us that there are several, such as Kohl-rabi, Salsify, and Scorzonera, which might be grown more often, especially by those who would like something a little outside the quite ordinary without adventuring beyond the well-tried.

Messrs. Dobbie showed their vegetables in seed, as a hint, perhaps, that vegetable seeds do not grow in sixpenny packets; for, I suppose, few of us give much thought to the time, labour, and care that comes bet
Nature's tousled capsules and the da
envelopes of the seedsman. It was intere
to notice at this exhibit how closely the s
of Celery seed resembles that of pigs;
comparison is not in any way derogato
Celery, but rather a plea of extenuation
the pig, whose aroma is really not pec
to him, since it occurs not only in Celery,
also in the border Phloxes, when few pe
seem to find it unpleasant.

The New Hall was luscious with f
and beautiful as well; some of the Ap
such as S. T. Wright, Guelph,
Benn's Red, were as gay as flowers,
reminded one what a fine decorative
a standard Apple may be and how well su
it is for the company of the mixed bor
especially in small gardens, where space n
be economised.

I was sorry that Messrs. Bunyard did
show their fruit in the black, cubist set
which was so effective at Chelsea; for t
collection always has an individual qua
and last week contained some historic
Apples, which seemed to hide behind t
more imposing successors in the compara
banality of varnished baskets.

There was only one dish of Medlars sh
in the Hall, and, although its uniqueness
be a just measure of the amount of inte
evoked by Medlars, it seems a pity that
fruit should be so little appreciated. M
people say that they dislike them, o
misjudging them to be rotten because t
are brown when they are ripe; yet there
few who fail to like Medlar fool, and
fewer who fail to appreciate Medlar jelly.

Among the new plants on the dais t
was a curious greenhouse climber, Phase
caracalla, from India (shown by M
Roper), which presumably has relatives
the vegetable garden, but looks a reg
hot-house exotic, with large waxy flower
ivory stained with violet, oddly twisted,
with conspicuous, curly buds. H

Sir William Lawrence's interesting exhibit of Cape Gooseberries in the New Hall

The variety Golden Nugget was shown in pots, the fruits of which are palatable when taken raw or coated with sugar. It is from this Physalis that the famous Cape liqueur Van der Hum is made. The plants were raised from seed sown under glass, and later planted out in rows like Dwarf Beans

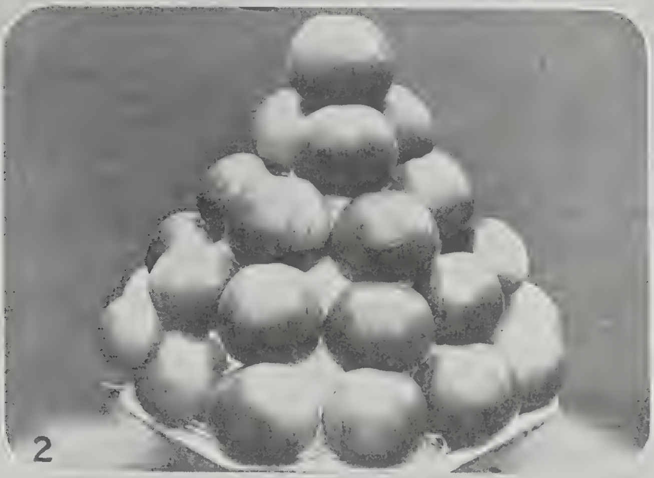
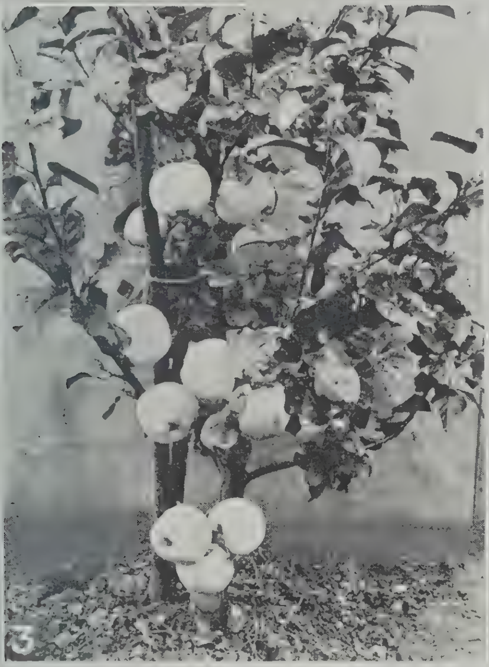
APPLES AT THE R.H.S. FRUIT SHOW

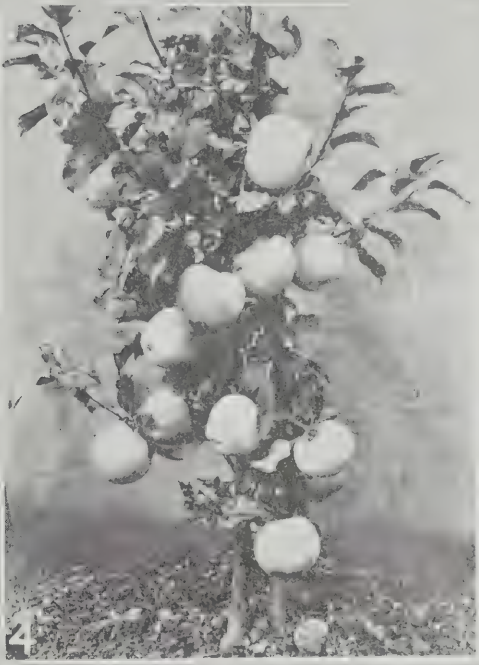
1



2



3



4

5

6

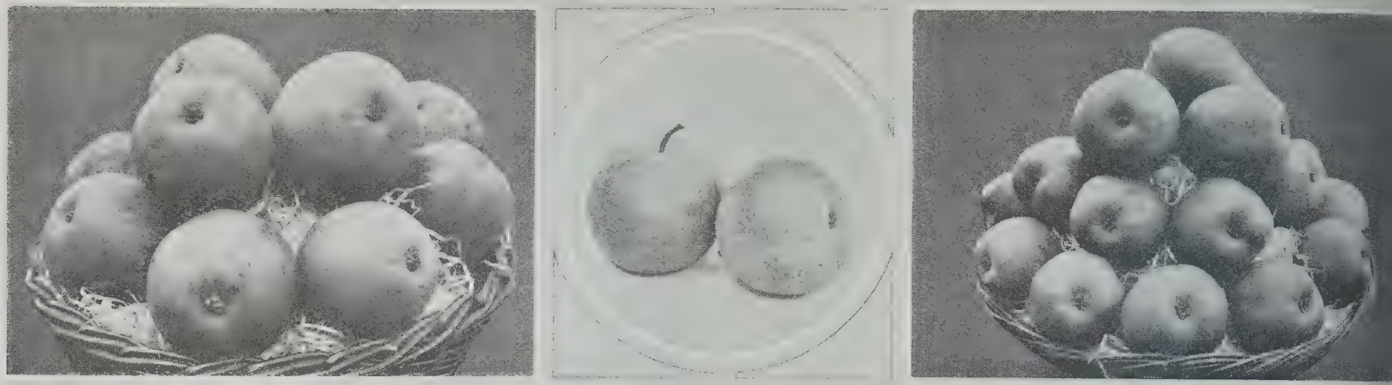
1 Egremont Russet, flesh crisp and of nutty flavour. One of the best drettiest of the Russets. October-November.

2 A fine basket of Annie Elizabeth, a first-rate culinary Apple that till June.

3 and 4. Four-year-old bushes of the Rev. W. Wilks, showing the fruitfulness of very young trees.

5. Basket of Warner's King, a useful market variety. The largest fruit was 5½ inches in diameter, and weighed 2 lbs.

6. Laxton's Superb, a dessert Apple that has come to stay.



THREE PEARS WELL REPRESENTED AT THE R.H.S. FRUIT SHOW

Beurré Alexander Lucas, a large Pear of good quality, in season from October to December. Flesh delicious and melting

Mrs. Sedon, a small dessert Pear with the flavour of Sickle Pear, in season in January. Parentage, Sickle x Bergamotte Esperen

Glou Morceau, a well-known variety of melt texture. This excellent Pear requires the she of a wall in cold districts

of soil will also affect flavour, but climate is the dominant factor. Flavour in the R.H.S. Show fruit on the whole was good, but it was not possible to taste more than a few. There was not that lasting quality. Good flavour, but it passed away too quickly over the palate. This is quite in accordance with the rainless, sunny season of 1929. Since a number of exhibitors come regularly every year it was interesting to compare their Apples and note the difference in this season from that of last. Upon tasting one Apple belonging to an exhibitor, finding the flavour excellent, with rich juiciness, and inquiring if he had watered his trees, "Yes," came the reply. "Only once, then a thorough soaking." And, of course, the surface soil was "picked up" and dried in order to conserve every ounce of water and make it available to the trees. When it was hazarded that he watered in August, "Yes, right," came the reply. The season supplied sufficient soil moisture to develop the fruit to perfection up to the last great drought, but not enough after to develop juiciness, flavour, and quality to their full capacity without that one thorough watering which he had supplied. His Apples were among the best flavoured of any in the Hall. Here is a selection for flavour for anyone contemplating renewals and additions:—St. Edmond's Russet, Egremont Russet, James Grieve, Ribston Pippin, Cox's Orange, Ellison's Orange, Golden Reinette, American Mother, Laxton's Superb, King's Acre Pippin, Reinette du Canada doré, Reinette du Canada Gris, and Orleans Reinette. These last three kinds have been known since 1896, but not till lately seen in England. C. A. J.

Vegetables at the Show

A remarkable feature of the Open Vegetable Classes was the success achieved by Messrs. Sutton and Sons' customers in winning no less than 32 First Prizes out of a possible 35, in addition to 27 Second Prizes and numerous Thirds.

Included in this list was the Silver Cup and First Prize in Class 201 for a table of vegetables 50 square feet, and the "Sutton" Cup and First Prize in Class 202 for twelve varieties of vegetables, both of which were won by Viscount Hambledon, of Greenlands, Henley (Head Gardener, Mr. W. Turnham). In both of these classes, as in that for nine varieties of vegetables, the first, second, and third prizes went to the produce of Sutton's Seeds, as well as the first prize for twelve and six varieties of Potatoes and for six dishes of Onions.

In addition, Messrs. Sutton and Sons were themselves awarded the Society's Gold Medal for the magnificent Collection of Vegetables, comprising no less than 175 dishes.

After Visiting the Show

A fragrant memory

SOME people do not like flower shows. They say they are out of date now. They add that a beautiful bloom is a wonderful thing in its natural setting of a well-ordered garden, but that the mass of heavy beauty and odour weighs down their spirit. I disagree with them. I have seen lovely flower shows in beautiful settings. They are things which seem to cleanse the whole mind. It is true that one cannot appreciate a single flower in a show as one can in a garden. It does not stand out as it does in its natural state. It is part of one glorious superfluity. But a flower show is like a Turkish bath to the senses. To wander over a beautiful countryside is like bathing in a fresh stream or in the sea. A walk in a luxurious garden or a hot-house is like a hot bath, calming and cleansing the senses with a feeling of perfect order and beauty. But a flower show does more than either of these. The overwhelming mass of beauty penetrates to the very pores and soaks one's being through and through with a fragrance which lasts for long afterwards.

Perhaps it is tiring to the senses and should be taken only at long intervals. It exhausts the senses simply because it cleanses so thoroughly. One is intoxicated by the thousand mingled scents, dazzled and overcome by the profusion of glowing colour. Of course, fashions change in gardens as in everything else, and without in the least decrying the enterprise and scholarship of the moment's fashionable movement, one may admit that the effort to keep pace with nomenclature and new varieties has in it the element of fatigue; thus from the brilliance of massed colour schemes, from the last Gold Medal Rose, the newest Gladiolus, Dahlias and Chrysanthemums and all the rest of the magnificent species, with relief one goes back in memory to an old-world garden we used to know.

Through wrought-iron gates, delicate as lace-work against the green, stand strange little figures of clipped Box, very well mannered, holding themselves stiffly above the rioting crowd. There are carpets of Heart's-ease and Forget-me-not under fountains of Honeysuckle and Jasmine. There is a tangle of happy "common" flowers, for they are not so very tidy, those gardens where the forgotten flowers grow. Larkspur and Lilies tumble against the dark Yew hedges with Lad's-love and Lavender, Moss Roses and old herbs of healing. It is an old-fashioned garden, where nothing is labelled and everything grows in a lavish abandon, smelling so
sweet. There, out of the soil, where

certificated Chrysanthemums

noveltles submitted to the Floral Com-
of the National Chrysanthemum
recently at the New Hall of the Royal
cultural Society were remarkable for
general all-round good quality. The
rd set by this Committee nowadays is
gh one, and this fact probably
nted in a large measure for the splendid
cter of the seedling Chrysanthemums
l. The following varieties were each
cipient of a First Class Certificate :—

rus.—A splendid variety for market or
sbudding. The florets are of medium
th, evenly disposed, and build a flower
lexed or slightly drooping form from
hes to 6 inches across. Colour, chest-
onze with gold centre and gold reverse.
n by Mr. J. Barrell, Bridgewater.

assy.—A beautiful bloom, in build not
the popular variety Alcalde. The
are narrow and very evenly arranged,
ping a full bloom 3½ inches to 3¾ inches
meter. The flowers are borne on stiff,
ike stems, and the foliage is small.
for market and cut flowers. Colour,
chestnut with gold tips. Also shown
. J. Barrell.

den Chestnut.—A very distinct flower
racter. The florets are fairly broad and
a full bloom of good substance about
hes across. Colour, rich chestnut, with
everse. The plant attains a height of
3 feet. Shown by Mr. J. Barrell.

wflake.—A chaste, pure white spray
y, bearing its dainty blossoms on long
, with each flower well set apart in the
The florets are narrow and the flowers
bout 3 inches in diameter. Useful for
g. Height, about 3½ feet. Shown by

rose.—A somewhat unique flower,
g broad florets, rounded at the ends,
they slightly incurve, and build a
about 5 inches or rather less across.
rs, lilac-pink with silvery reverse.
t, 5 feet. Also shown by Mr. H. Shoe-
, Jr.

alier.—This is a highly-finished flower
autiful quality. Florets narrow to
m, very evenly arranged, building a
of exquisite form, about 5 inches in
ter. Colours, bronzy-terra-cotta, with
points—a beautiful autumn colour.
t, 5 feet. Shown by Mr. H. Shoesmith,

eral new Chrysanthemums were also
at the meeting of the R.H.S. Floral
mittee, Section A, on October 2nd, but
wo varieties were the recipients of an
l of Merit. They were as follows :—

o.—This is a useful disbudded Japanese
, having florets of medium breadth,
ng a reflexing bloom of good form,
4½ inches to 5 inches in diameter. This
y should prove useful both for market
t flowers. Colour, bronze, tipped gold.
erect stems and small foliage. Shown
r. H. Shoesmith, Jr., Mayford, nr.
ng, Surrey.

s. Sarah Knight.—Another useful
y for cut flowers and for market. The
are rather broad and flat, building a
flat flower of substance, about 6 inches
. Colour, rose-pink with silvery
e. Also shown by Mr. Shoesmith, Jr.

D. B. Crane.

Artemisia lactiflora

ls fine late-flowering Chinese perennial
worthy subject for the herbaceous
d, wild garden, or for planting along-
stream or waterside. Blooming in
mber, its somewhat fragrant white
ra-like flowers are borne in branched
panicles on erect stems 3½ feet to 4½ feet high. The flowers, which are freely produced, provide excellent cutting material for indoor decoration. The plant is of the easiest cultivation, and responds to treatment similar to that meted out to other hardy herbaceous perennials.

J. L.

New Dahlias selected at Wisley

The Joint Committee of the Royal Horticultural Society and the National Dahlia Society held a further meeting at the New Hall, Greycoat Place, on October 2nd, and no fewer than 21 new varieties were submitted for adjudication. Seven varieties were selected for trial next year in the gardens of the Royal Horticultural Society, Wisley, Surrey, as follows :—

Phyllis Wheaton.—A charming miniature-flowered Pæony Dahlia, about 3 inches in diameter, and highly decorative as a cut flower. The florets are medium to fairly broad, and build a flower of dainty form. Colour, bright pink, with white centre. Stiff, erect stems. Shown by Messrs. J. Cheal and Sons, Ltd., Crawley.

R.H.S. Fruit Show: The splendid exhibit of fruit from Reading University College

This exhibit contained well-packed boxes (20 lbs.) of Apples Lane's Prince Albert, Allington, and Worcester Pearmain. Half-bushel sieves of the same varieties were also staged, but sieves are not so much used now. Over 40 varieties were shown in single dishes, including Cox's Orange Pippin, Egremont Russet, Blenheim Orange, Bramley's Seedling, Beauty of Kent, and Newton Wonder. The pick of the Pears were Louise Bonne of Jersey and Doyenne du Comice. Silver Gilt Hogg Memorial Medal

Felbridge Star.—This is a Dahlia of true star-like form. Florets of medium breadth, tapering off to a blunt point, building a flower of pleasing decorative form about 2¾ inches across. Colour, orange buff. Stiff, erect flower stems.

Bognor Star.—One of the very best Star Dahlias of recent introduction. The flowers are about 3 inches in diameter, having florets medium to fairly broad at base, tapering off to a point, building a star-like flower of exquisite form. Colour, a beautiful salmon pink, with a crimson zone round the disc, and the florets also suffused crimson at the base. Stiff, erect flower stems. The last two Dahlias were shown by Messrs. J. Cheal and Sons, Ltd.

Aurora.—An interesting small-flowered Pæony Dahlia, about 3½ inches across. Florets rather broad. Colour, salmon terra-cotta, deeper colour at base of florets. Bronze foliage and stems. Shown by Messrs. Wm. Wood and Son, Taplow. This variety has to be renamed.

Albion.—A promising small-flowered Pæony Dahlia, about 3½ inches to 4 inches in diameter, of good form and substance. Florets, medium to fairly broad, evenly disposed around the disc. Colour, primrose with rich orange-yellow disc. Good, erect flower stems. Shown by Messrs. E. Burrell and Co., Cambridge.

Cedric.—A distinct and pretty miniature-flowered Pæony Dahlia. Florets of medium width, building a flower of good form, between 3 inches and 3½ inches across. Colour, bright crimson maroon. Stiff, erect flower stems. Also shown by Messrs. Burrell and Co.

Edna.—Another interesting small-flowered Pæony Dahlia of good form, about 3½ inches in diameter. Colour, rose-pink with large, white tips. Really a fancy flower. Shown by Messrs. E. Burrell and Co.

A noteworthy Pæony Dahlia

A somewhat unique, small-flowered Dahlia, bearing the name of "Tiny," raised by that veteran Dahlia grower Mr. J. T. West, of Brentwood, Essex, has quite captivated those who endeavour to illustrate the decorative value of the Dahlia. With blossoms of this charming little Dahlia the writer last year won first prize at the National Dahlia Society's Show for a sideboard decoration and at the same Society's exhibition this year with the same variety Mrs. Courtney Page was placed first in a class for dinner table decoration. The dainty flowers are between 3½ inches to 4 inches in diameter, and are of true small-flowered Pæony form. The florets twist in a most delightful manner and build a really beautiful flower that is borne on a stiff, wire-like flower stalk. The colour may be described as a pretty shade of buff.

D. B. Crane.

Winter-flowering Shrubs

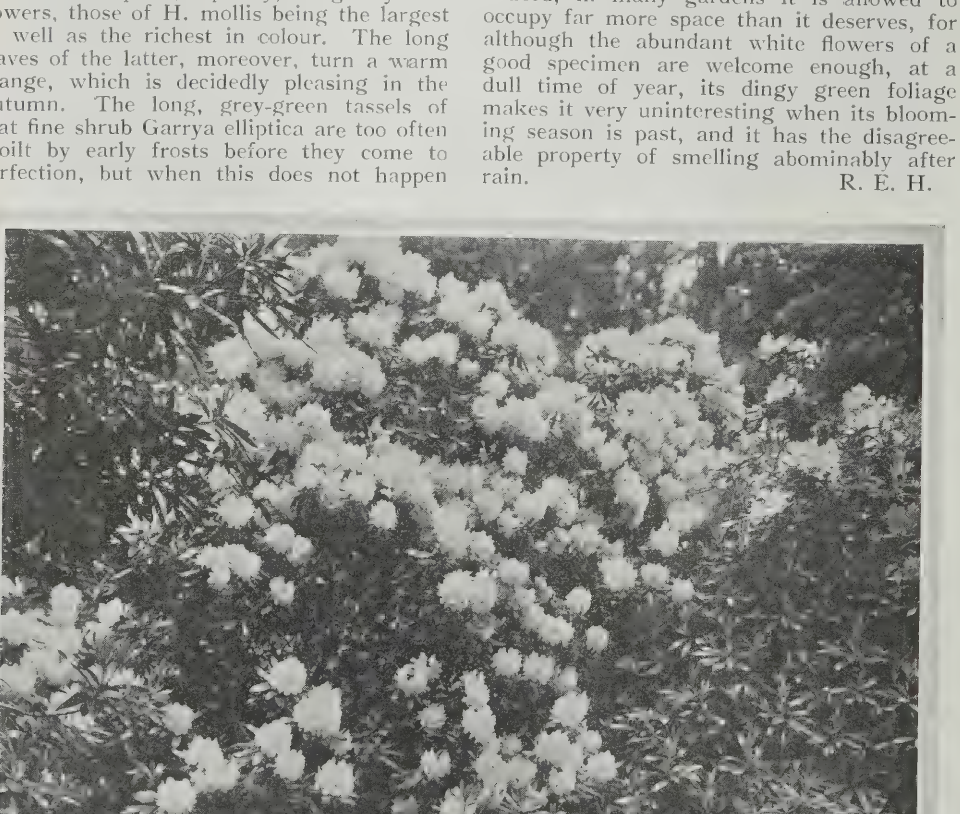
IT is rather regrettable that winter-flowering shrubs are comparatively seldom seen in small gardens, for not only is their decorative value great when growing, but they are most useful for cutting at a time of year when flowers are at their scarcest. One of the best of such shrubs is Prunus Miqueliana, a Japanese Cherry of recent introduction, which begins to open its rose-tinged white blossoms in November or early December and continues to produce them throughout the greater part of the winter. This pretty Cherry, which makes a low tree, is perfectly hardy in this country under ordinary conditions. Another shrub which blooms in December is the Winter Sweet, Chimonanthus fragrans; its small, tawny-yellow flowers are not showy by any means, but their scent is delicious, and if a few of them are floated in a dish or arranged in a shallow bowl filled with mossy Saxifrage they will perfume a room delightfully. Chimonanthus is a straggly, untidy grower, and for this reason is best planted against a wall, but it is quite hardy and will do equally well in the open. It should be cut hard back directly after flowering.

More sweetly scented even than Chimonanthus are the winter-flowering Honeysuckle, Lonicerca Standishii and L. fragrantissima. Both bear small, creamy-white blossoms that, in the case of L. Standishii, are produced as early as December on the leafless stems. Lonicera fragrantissima, which usually comes into bloom in January, is more or less evergreen, according to the mildness or severity of the season. Two excellent winter-flowering shrubs for the small garden are the Witch-hazels, especially Hamamelis arborea and H. mollis, the first named of which comes from Japan and the second from China. Both have queer, spidery, bright yellow flowers, those of H. mollis being the largest as well as the richest in colour. The long leaves of the latter, moreover, turn a warm orange, which is decidedly pleasing in the autumn. The long, grey-green tassels of that fine shrub Garrya elliptica are too often spoilt by early frosts before they come to perfection, but when this does not happen they are exceedingly ornamental, both in the garden and the house. Frosts of ordinary severity will not do more than disfigure the leaves and flowers of Garrya elliptica, for it is quite hardy, but G. macrophylla, a handsome species, is tender in this country, save in exceptionally warm localities, and even there it should be given the shelter of a south wall. There are several beautiful winter-blooming Rhododendrons, for one or two of which room should be found in every garden, provided, of course, that the soil is suitable, that is to say, free from lime and, if possible, peaty. R. nobleanum, the rosy flowers of which often appear when the snow is on the ground, R. dahuricum, R. præcox, and R. parviflorum are all handsome.

To enliven the rock-garden there are the winter-flowering Heaths, the dwarf Erica carnea, the taller E. Mediterranea, and a delightful hybrid between the two, E. darleyensis, otherwise E. carnea hybrida. The last mentioned begins to flower in November, and is a particularly pleasing shade of rose-pink. These Heaths, unlike the rest of their kin, do not object to lime in the soil.

The Forsythias may perhaps by stretching a point be included in the list of winter-flowering shrubs, as F. suspensa, if given a sheltered position against a south wall, will begin to open its golden bells in early February. Other desirable Forsythias, although slightly less hardy and not quite so early flowering are F. spectabilis, less straggling in habit and with flowers of a deeper yellow than suspensa; vitellina; viridissima, and a hybrid between the latter and suspensa, named intermedia. All are well worth growing. Viburnum Tinus, familiarly called Laurestina, is too well known to be more than just mentioned here. Indeed, in many gardens it is allowed to occupy far more space than it deserves, for although the abundant white flowers of a good specimen are welcome enough, at a dull time of year, its dingy green foliage makes it very uninteresting when its blooming season is past, and it has the disagreeable property of smelling abominably after rain.

R. E. H.



One of the old white Rhododendrons

Planting berry-bearing shr

Berry-bearing trees and shrubs a planted so much as they should be, co ing their value in the dark days of when practically most of our flowers a troyed by an early spell of frost. Ar the showiest trees at the present time f compare in effectiveness to well-grown mens of the Mountain Ash. In woo waste places generally, where the soil is and stony, this shrub may be found, dual plants forming clusters of perfec liness. Beautiful as this shrub is, it still be impossible to oust the Holly many forms from its proud position.

The large number of varieties c Cratægus family provide us with a big C. crus-galli and its varieties are perha most effective, and it is difficult to selec thing more pleasing than the splendens, with its bright red fruit hidden in the leaves. C. coccinea is a valuable tree to plant. C. Pyracanth Fire Thorn, is a brilliant shrub, and bedecked with its rich-coloured fruit, p ses an indefinable charm.

Among Cotoneasters, there are s worthy of being planted in any garden, or small. Such species as C. fr C. Simonsi, and C. buxifolia can be dep upon to give a good account of thems Pyrus offers a number of showy fruiting P. baccata and P. Aucuparia and its forms are all showy kinds. As a bush laden with bright berries, the Aucuba ta lot of equalling, but it must be allowed space to develop, and the male variety be intermixed to secure a plentiful cr berries. Many of the Barberries bear spicuous fruit, the new hybrids o Wilsonæ being noteworthy. Arbutus U is a fine fruiting evergreen shrub or tree. Where Pernettyas are grown, a effect is produced by their diverse, bri coloured fruit, whilst a more lowly Can plant is noticed in Gaultheria procum As a winter-fruiting shrub, the Snowb Symphoricarpus racemosus, is supe severely cut back in early spring. Euon europæus and E. latifolius are both fruiting trees.

Although the shrubs mentioned b means exhaust the number of trees shrubs with showy fruit, they are suff to show what a wealth of material is able for garden decoration. All thriv ordinary garden soil, and although late f may injure some species during their flo ing season, there is sure to be a sprin of berries, whatever the season.

H. STEVE

Rhododendrons

SOME Rhododendrons planted a goo years ago at the edge of a bit of w land are now a great height, although a number of them were s broken about by the heavy snow the winter of 1927-28, some of escaped, and this year flowered profusely than ever. They are what w now be called old kinds, Minnie and John Clutton, both white, but they can ha be beaten for their abundance of bloom general good effect. When they were pla their names were painted on some labe Acacia wood nearly ½ inch thick. It wood of great durability. These labels long been forgotten, but lately, when c ing away some of the rubbish under Rhododendrons, a number of them found. The painted names had disappea but the labels themselves were so sound if their surfaces were shaved and they painted afresh they might have been again.

ure intact should be avoided. By far
ter plan is to dig it well over and
hly mix it with the second spit of
his being done, the original top soil
be replaced, incorporating with it a
further dressing of bone-meal as the work proceeds. When complete the soil should be left in as rough a state as possible, given a liberal dusting of wood-ash or the remains of the garden fire, and left to the action of the weather. In the spring all that is necessary is a dressing of lime, a good handful to the square yard, and a thorough raking to level the soil a week or 10 days prior to planting-out or seed-sowing. Even the foregoing routine may sound tedious to many, but actual experience has shown that the energy expended is amply repaid by an abundance of spikes bearing four good-sized blooms. There is also that reasonable length of stem without which the Sweet Pea loses much of its daintiness and elegance, and thereby proportionately decreases in decorative value.

Varieties which have responded well on land prepared as suggested are Model (white), Victoria (lavender), Picture (cream-pink), Grenadier (scarlet), Charming (cerise), Sunkist (cream with pink edge), and all-round excellence would seem to indicate that any good standard variety would prove equally successful. A. E. W.

Rhododendrons at the edge of woodland

Plants which love the sun

In a drought-stricken garden a few plants stand out as sun worshippers, and seem to fornica shown such a mass of scarlet bloom. moisture.

Never with me has Zauschneria Californica shown such a mass of scarlet bloom. It grows on a narrow border at the foot of a south wall in hot, sandy soil. In the same border two " Plumbagos " are in perfection. The dwarf Ceratostigma plumbaginoides (formerly called Plumbago larpentæ) and the shrubby C. Willmottianum.

Both bear flowers of an intense blue, a colour rare in the autumn garden. The plants are now a mass of blossom.

C. plumbaginoides is an old garden plant, but C. Willmottianum is of much more recent introduction. Here it is quite hardy and seeds itself in the border. It was cut to the ground by the Arctic cold of last winter, but grew away strongly from the base. The bushes are now as large and as full of bloom as ever, though the flowering began later than usual. This rainless summer appears to have suited Perowskia atriplicifolia, and a bed of it is now very beautiful. The plants are spaced and have a ground work of the " Lace Flower " (Didiscus). It is a successful combination. B. C. T.

Wiltshire.

Scabiosa caucasica

Among useful hardy plants which at this season may be raised from seeds is the Russian Scabious—S. caucasica. In some districts, and in certain soils, it is rather liable to perish during the winter after a season's flowering. In this respect it resembles Coreopsis grandiflora, and to maintain a good stock of these very ornamental and useful subjects it is wise to make a sowing in a box, placing in a cold frame towards the end of September.

A Scottish Gardener.

REMINDERS FOR THE WEEK

Southern and Midland

Tomatoes

As fruit cannot be relied upon to ripen in the open, even on sheltered walls, it is advisable to sever the growth below the bunch of fruit nearest to the ground and suspend fruit and growth from wires in a cool—but frost-proof—greenhouse after this date. Those still cropping in cool houses may be similarly treated. Thus valuable room becomes available for subjects which have recently been potted up from the open ground.

Arum Lilies, Bouvardias, Solanum, and Crinums

These and similar plants will find excellent accommodation in cool houses for the present, unless it is desired to hasten the two former into bloom, in which case a little artificial warmth must be given at night. When growth in the former becomes vigorous and the spathes begin to rise, a little assistance, either in liquid or artificial manure should be given.

Winter-flowering Begonias

A little extra staking and tying is necessary for these beautiful subjects, and whereas anything approaching stiffness should be avoided, support being necessary, use stakes of a slender but wiry character, so that when completed the plant presents a loose and graceful appearance. Although the stakes are scarcely seen, they are effective and unavoidable.

Chrysanthemums

These now occupy considerable space under glass, and the earliest house is full of prominent blooms, some of which show a tendency to damp, therefore watering must be carried out in the morning, as far as possible, and a cool, airy temperature of about 45 degrees maintained at night by means of a little warmth through the pipes if wet, cold nights set in. Large batches of bush plants, including late flowering kinds, must of necessity be held back in cool fruit houses, or even at the foot of sheltering walls, where a covering may be drawn over them at night. Dense crowding, however, should be avoided and, if under glass, plenty of air admitted.

Dahlias

When checked by frost, lift and store the roots in a cool, dry, and airy shed, and where they are not liable to become frosted. It is advisable that these should be reasonably dried before actually storing them close together, as they keep better. Following this, a little Cocoa fibre shaken among them will maintain the roots in a plump and not too damp condition. Each kind should be carefully labelled before storing.

Cold frames

Unless required for the accommodation of plants, cold frames should be filled without delay with Lettuces, such as Trocadero, Hardy White Cos, Winter Beauty, and Endives, as these will prove invaluable during March and April. Air must be freely admitted on all favourable occasions.

Propagating

A few more cuttings of shrubs, Violas, Salvias, and Pentstemons may be inserted, and many of these already rooted may be potted up or boxed off, as the case may be. Very little growth, however, will be made from this date until the turn of the year, although root action will proceed.

Spring bedding

Endeavour to complete this work as soon as possible, so that the plants may become firmly established in the new soil while a little warmth remains, and thus enable them to withstand the winter better.

Sweet Peas

A light dusting of soot over those sown in September in the open will check the depredations of slugs. A sowing made at the present time in pots will provide plants for blooming under glass at the end of March. The seeds may be sown singly in 60-sized pots, or five seeds in a 5-in. pot, and shifted as required. A cool place should be chosen until germination has taken place, when they should be placed near to the glass and watered with care.

Broad Beans

A good sowing made now on a sheltered border will provide a crop of fine beans at a very early date, and before the earliest batch raised under glass.

Rhubarb for forcing

Lift a few roots and expose them to the weather before placing them in a bed of leaves beneath a greenhouse stage or mushroom house.

Fruit trees

Order fruit trees and thus secure some of the best examples before stocks have become drained of them. E. MARKHAM.

Gravelye Manor Gardens,
East Grinstead, Sussex.

Scotland

Spent vegetable crops

It is never advisable to leave spent crops for long in the garden, as they are not only unsightly, but their presence furnishes cover for numerous pests, both animal and fungoid. The sooner, therefore, all such are cleared to the rubbish heap, the better. Everything, of course, that will burn should be thus consumed, and by this means great numbers of vermin are destroyed, and what might have been dangerous material turned into a valuable dressing for the garden, most crops benefitting from the ashes from a "smother-fire."

Take care of the rubbish heap

It should always be seen to that the rubbish heap is safe from pollution by the roots or seeds of perennial weeds, for when once spent crops, annual weeds, and lawn mowings have rotted down, they form a valuable dressing for both the vegetable and flower quarters, this material being but little inferior to farmyard manure, now so difficult to procure. To accelerate the rotting process and to improve the quality of the heap, it should be turned and mixed occasionally, and if some fresh lime can be incorporated with it while turning is in progress, vermin will be discouraged and the material sweetened and improved.

Maincrop Beetroot

While there is no particular hurry to have this root crop harvested, it will really make little or no further growth, so if the weather is favourable, get it up and safely placed under cover. No crop demands so careful handling when being lifted and stored, for if either broken or bruised the quality is considerably impaired. Store in a fairly dry shed or cellar, and see that mice and rats cannot gain an entrance, or much damage may result.

Late Carrots

These, too, will be all the better for being now lifted and stored as autumn rains are very apt to split many of the roots. While not nearly so easily damaged as Beetroot, a little care in handling always pays, as th
keep better and have a finer appearanc
unbroken and otherwise undamaged.

Seed Potatoes

These must, of course, be stored in
place where frost can never reach
Although not absolutely essential,

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

Growing the Aubergines

IS it possible to grow Aubergines here in Sussex with a small greenhouse? We have some heat there during the cold weather, but the seedlings all died this year.

Sussex. LADY EDWARD GLEICHEN.

[To cultivate these successfully it is necessary to grow them in pots under glass, as the fruits cannot always be depended upon to finish properly in the open in our climate, except during a very favourable summer when planted at the foot of a warm, south wall and carefully tended. The seeds should be sown in a rich, light compost early in February, potted off singly when large enough to handle, and shifted on into larger sizes as growth advances, a 6-inch pot being large enough to fruit them in. A temperature of 50 degs. to 60 degs. will suit them admirably. Pinch out the tips of the shoots when the plants are about 7 inches high, and do not allow more than ten fruits to each plant. When these are swelling freely, feed liberally with liquid-manure water.]

Aubergines

The fruits of Egg plants play a more important part in the cookery of the French and Italians than in this country

FRUIT

Pruning wall fruits

(S. E. A.).—Sweet Cherries are pruned in much the same way as are Apples, but the Morello requires quite different treatment, as it fruits chiefly on the previous year's wood. It is necessary, therefore, to lay in as much of the young wood as space can be found for, cutting away such shoots as may not be required. The Peach is pruned in much the same way as the latter, or, rather, the shoots that remain after the summer treatment are similarly treated. The Peach, during late spring and early summer, has to be carefully disbudded, and if this is properly done practically no pruning will be necessary, although some of the older wood may have to be removed. Any pruning should be done in late February, in the case of the Peaches, but Cherries of any kind can be attended to as soon as the leaves fall. The Lemon Tree is best left alone.

Diseased Apples

(R. V. Stoney).—Without actual examination of the specimens concerned, we cannot say what is the cause of your Apples cankering off just above ground level. As the trunk of an Apple is rather large for the purpose of sending to this office, we think your best plan would be to call in the services of your local Horticultural Adviser who could examine the trees on the spot and report.

Strawberry foliage

(Inquirer).—The specimen leaves sent are attacked by Leaf Spot and Leaf Hopper. The former is caused by a fungus and can be controlled to a large extent by the removal of all the old foliage when the plants are cleaned up after fruiting. All the material removed should be burnt. If in spite of the above treatment the disease shows signs of spreading, spray the plants with dilute lime sulphur. The Leaf Hopper can be controlled by spraying with a good insecticide, but the operation should be carried out before the creatures reach the adult stage.

Apple foliage

(Inquirer).—The foliage of your Apple has been attacked earlier in the season by a pest, probably Red Spider. The pest has now moved on, and the later foliage is healthy. Spraying the trees with lime sulphur when the trees are in the pink bud stage, and again when the petals have dropped from the flowers would control the trouble, if it is due to Red Spider attack.

Manures for Apples

(A Reader).—A good basic manure to give Apple trees is undoubtedly basic slag and sulphate of potash. As these two manures do not mix well together they should be applied separately. Basic slag might be applied at the rate of 4 ozs. and sulphate of potash at 1 oz. per square yard. Whether or no nitrogen is required we cannot, of course, say; you must be guided by the growth of the trees. If the growth is poor, give a dressing of farmyard manure, supplemented by a light dressing of sulphate of ammonia.

Damson tree not fruiting

(A. E. C.).—The reason why your tree does not fruit is most probably due to birds picking out the fruiting buds during the winter and early spring months. Serious losses occur annually both among Damsons and Plums and also other fruit trees, the damage having been done before one is aware of it. If you could net your tree or protect it in some way from birds we feel confident that fruiting will follow. Spraying with a bitter substance, such as quassia extract, will render the buds distasteful for a time, but this must be constantly repeated. You might also try spraying with one of the tar oil washes now offered, as this may prove more lasting in its effect.

Apple branch attacked by Woolly Aphis

(T. B. W.).—Your trees are badly attacked by Woolly Aphis and also by Mussel Scale. Spray the trees thoroughly immediately the fruit is gathered with paraffin emulsion which should destroy a large proportion of the pests before they have gone to the roots. The formula is as follows:—Paraffin, 4 pints; soft soap, $1\frac{1}{2}$ lbs.; water, 10 gallons. To prepare:—Dissolve the soft soap in about a gallon of boiling water, remove the solution from near the fire and, while still hot, add the paraffin. Churn the mixture very thoroughly by syringing it back into itself. When required for use, add soft water to make 10 gallons and mix again thoroughly, so as to make sure that there is no free paraffin floating on the surface. For the Mussel Scale use double the quantity of paraffin, otherwise soap and water are the same. In such a bad case as yours appears to be, we advise another spraying in February.

TREES AND SHRUBS

Winter evergreen

(A Reader).—The correct time to prune Holly is towards the end of March and, for Yew, July. We think you could take what Holly you want at any time during the winter without fear of doing any harm, provided the growths were cut out carefully. Much depends upon where the Hollies are growing. If they are specimen trees cutting will most likely spoil their shape unless very carefully done. On the other hand, straggling trees in odd corners could, with advantage, be cut back. Yew does not stand cutting back so well, but, again, much depends upon the position of the trees. Pruning at the correct time is, of course, best.

Shrubs for cultivation in pots

(Mrs. W. Watson).—Kalmias, Rhododendrons, Eucryphia pinnatifolia, Clethras arborea and alnifolia, Ceanothus Gloire de Versailles, C. Veitchianus, C. dentatus, Forsythia spectabilis, and Weigelias will yield to gentle greenhouse treatment, but must not be heavily forced. The following, too, would suit you:—Deutzias gracilis and Lemoinei, Hydrangeas both of the hortensis type and H. paniculata grandiflora, Lilacs Marie Legraye, Mme. Lemoine, Souv. d'Louis Spath, Magnolia Alexandrina, M. conspicua, M. Lennei, M. stellata, Prunus triloba, Abelia chinensis, A. triflora, Kerria japonica fl.-pl., Viburnum opulus sterile, V. plicatum, Genista fragrans, Wistaria sinensis (blue and white), W. multijuga, Cytisus andreanus, Ghent and mollis Azaleas, Carpentaria californica, Lonicera Hildebrandtii, Pittosporums Mayi, P. Tobira, P. Ralphii, Abutilon vitifolium, Boronia megastigma, Acacia Baileyana, A. dealbata, A. armata, A. longifolia, Grevillea rosmarinifolia, Bamboos in variety, such as B. aurea, nigra, nitida, and spathulata, Brugmansia Knightii, B. sanguinea, Clerodendron Balfourianum, Plumbago capensis, Cassia corymbosa, Clianthus puniceus magnifica, Correa magnifica, Cytisus racemosus, Myrtus Luma, M. Ugni, Habrothamnus Newelli, H. aurantiacum, Jasminum primulinum, Metrosideros floribunda, Punica granatum fl.-pl., Rhyncospermum jasminoides, Sollya heterophylla, Streptosolen Jamesoni, Swainsona galegifolia, Abutilons Boule d'Neige, Golden Fleece, Souv. d'Boun, Thompsoni and vexillarium, Osmanthus Delavayi, Hoheria populnea var. lanceolata, Prostanthera lasianthos, P. rotundifolia, Anopteris glandulosa, and Olearia insignis.

The preparation of grass land for flowering shrubs

I am about to build a house and lay out a garden on a field that was formerly arable and has been grass for 20 or 30 years. Soil is described as "valley gravel," and the field is said never to tread into mud even in the wettest weather. I want to have some good flowering shrubs to give a succession of flowers from early spring to late autumn; in fact, all the year if possible. May I ask you to recommend hardy, good growers that need no coddling, also any that have a fine foliage? What is the best thing to do to begin with? Ought I to plough and take a crop of Potatoes or something of that sort to clean the land before planting the shrubs? Any advice will be most gratefully received, and thanking you in anticipation. VERES.

[All land intended for shrubs should be trenched to a depth of 2 feet 6 inches, or holes taken out for each plant to that depth and 3 feet across. The turf should be replaced, grass downwards, in the bottom of the trench or hole and the soil turned over to complete the making up of the trench. Allow the soil to settle for a week or two, following which the shrubs may be planted, a little leaf-soil being spread around the roots to encourage them to start. No further preparation will be necessary, and except to keep weeds down little will be required for several years. You do not say whether your land is free from calcareous matter, but if chalk or lime exists in the soil then you must avoid Rhododendrons, Azaleas, Ericas, Kalmias, and similar peat-loving subjects. The land not required for shrubs would most certainly benefit if ploughed up and cropped as you suggest for the first season. We make the following suggestion to give you flowering shrubs over most of the year:—Chimonanthus fragrans var. grandiflora, Lonicera fragrantissima, Jasminum nudiflorum, Erica lusitanica, E. Darleyensis, Hamamelis mollis, H. arborea, Parrotia persica, Forsythia spectabilis, Garrya elliptica, Rhododendron præcox, Berberis Darwini, B. stenophylla, Erica arborea alpina, E. carnea, Spiræa arguta, Daphne Mezereum, Pyrus japonica var. splendens, Eleagnus macrophylla, Rhododendron Ascot Brilliant, Bagshot Ruby, Cynthia, Pink Pearl, Decorum, Beauty of Tremough, Dr. Stocker, Mrs. Wm. Agnew, and Doncaster, Mollis Azaleas (the colours of which may usually be chosen according to individual taste), Ribes sanguineum, Camellias, Halesia tetraptera, Lilacs Souv. de Louis Spath, Mme. Francisque Morel, Marie Legraye, Pasteur, Hugo Koster, Magnolia stellata, M. rustica rubra, M. Lennei, M. virginiana, Rosa Moyesi, R. Hugonis, R. rubrifolia, Cercidiphyllum japonicum, Viburnum plicatum, Spiræa bracteata, Desfontainea spinosa, Cornus Nuttalli, Escallonia langleyensis, Xanthoceras sorbifolia, Phlomis cashmeriana, Embothrium coccineum, Cot
horizontalis, C. Henryi, Cistus laurif

Moving large Azaleas

(Mrs. G. Hoare).—Yes, these can b
planted with safety, providing the
carefully done. The end of October is
cellent time for the work. If the weat

dry for a time beforehand, soak the with water a day or two before transng, then take out a trench about 18 wide all round the ball of roots, the f which must be judged on the spot ling to the size of the plant; for ce, a plant 10 feet high should have a roots at least 3 feet in diameter, and so y taking out a trench you are thus ento tunnel beneath the ball of roots and either a flat shrub barrow or strong right underneath, which may then be for lifting and transferring the shrub new home, which should be prepared in ce. Trench the soil deeply where the is to go, and use plenty of old leaf- along with the soil when filling up, ing it firmly around the ball of roots, hen completed give one good soaking of and place a mulch of litter—not manure the surface, and you need have no y about them afterwards. Watch the next May, which is often a very dry and water if necessary. To facilitate ork, tie a cord to the centre stem and round the branches, so as to draw them er and enable the worker to get close to

ROSE GARDEN

in different colours

J.).—We think that the following five es of Roses, being all healthy growers f fairly dwarf habit, will best suit your d position: No. 1 bed, Lady Inchiquin; , Mrs. Henry Bowles; No. 3, Golden ; No. 4, Mme. Butterfly; No. 5, Roundway. All are distinct, and conairly well to your requirements.

manures

eader).—In a soil which naturally does ntain lime, it is necessary to add lime time to time. On the other hand, a ng each year is not required. Once the ontent of a soil has been brought up to rd, an application at the rate of 4 ozs. per square yard once in two ee years is sufficient. Basic slag conbout 5 per cent. free lime, so that when s. of basic slag is added, 5 lbs. of lime tained therein. You do not state what manures are given. Try a dressing of te of potash in addition to some well farmyard manure. If the latter is not ble, use a substitute for it such as Hop e. Continue with a light dressing of slag each autumn.

and basic slag

J.).—There can be no harm done by a dressing of basic slag at the rate ned, but the Rose demands something so either Tonk's preparation or Thom-Plant Manure should be used in spring. urseryman will supply these materials, inted directions are supplied with each e. Bone-meal is excellent for Roses, somewhat slow in action. About per square yard may be used.

FLOWER GARDEN

g Dahlias and Salvias during the inter

E. P.).—The roots of Dahlias and us-rooted Salvias, such as the blue patens, should be lifted on a fine day ter being dried slightly should be stored n a cool, dry, frost-proof shed or cellar few dry leaves shaken among them. s way the roots will winter safely, ay be taken from the store again in —about the first week in May—and direct in the open ground. If, howt is desirable to increase any of them, roots may be placed in boxes together with a little leaf-mould and sand in March and stood in a warm greenhouse, where young shoots will soon develop, and these when about 4 inches long may be detached, with a small piece of old tuber, and potted up separately. The old plants may be cut down at once.

Pæony not flowering

(H. A. L.).—Pæonies do not flower well before the second or third year after transplanting, and as you appear to have trenched and manured your ground well before planting, we would advise you to cease all applications of manure water, as not only is this unnecessary, but harmful to young plants, and probably the cause of your trouble. Give the plant one more season, and if it fails to mature its flowers, put it on the fire as there is nothing else you can do for it. The best time to plant Pæonies is September and October. We regret your former letter miscarried.

The best time to plant

What is the best month in which to plant out of doors the following:—(1) Allium Ostrowskianum, (2) Roscoea cautilioides, (3) Schizostylis Mrs. Heggarty, (4) Sprekelia formosissima, (5) Tritonia Prince of Orange?

Torquay. R. W. L.

[Nos. 1, 2, and 3 may be safely planted during the present month in your locality. Nos. 4 and 5, however, should not be put out until the middle of April next year.]

Light blue Hyacinth to bloom with l'Innocence

For many years I have planted a grave with white Hyacinths and light blue Hyacinths, which come into bloom at Easter. I buy the best, about 6 dozen white and 3 dozen blue. The white is always l'Innocence, and I have tried the following light blue: Grand Maitre, Johan, Queen of the Blues, Schlotel, Lord Derby, La Pegroux, and nearly 20 years ago Preneman (which cannot now be obtained, though it did the best), but always I have found the light blues will be about a week or 10 days behind l'Innocence. Can you kindly suggest a light blue to meet my wishes? I have had professional advice, but so far without success. H. C. L.

[While we think you will find some difficulty in getting a blue and white Hyacinth opening their blooms at the same time, we would recommend you to try either Enchantress or Forget-me-not, and in case you find difficulty in procuring these varieties we would point out that both are offered by Messrs. Dobbie and Co., Ltd., Edinburgh.]

GREENHOUSE

Lilium auratum platyphyllum after flowering

(Subscriber, Esher).—Allow the growth to ripen off naturally, and when the leaves have turned yellow, cut the stems down to within 6 inches of their base. Stand the pots in a cool, frost-proof place—not necessarily a greenhouse—where they may remain until February, when the bulbs should be shaken out, cleaned, and repotted as before in fresh loam. The pots may then be removed to a cool greenhouse or frame free from frost and brought along gradually. Planted as you suggest, three bulbs in a large pot, these Lilies are extremely beautiful, and if well grown will reach 9 feet or more in height, carrying many handsome blooms, especially in their second year.

Begonias disfigured

(J. Bratley).—Although none were visible on the shoot submitted for examination we consider this a very bad attack of Mite, and you would be well advised to burn all you possess and secure a clean, fresh stock. Cyclamens are frequently damaged by this pest. If, however, you decide to retain your plants your best remedy is to fumigate with nicotine every 10 days, and, after damping the foliage, dust all parts with nicotine powder. The trouble arises through hot, dry temperatures having been kept continuously. In future, and especially during the early stages of growth, maintain close, brisk, and moist temperatures where winter-blooming Begonias are growing, stages, floors, and walls being damped over freely, and very little air admitted, and future results should surprise you.

Primula Sinensis

(M. N. Bostock).—Primula sinensis should not be syringed at all. This in itself would cause the rotting of the foliage, and it is now doubtful whether you will be able to save them. While this Primula does not require a high temperature it is desirable, in autumn and winter, to afford it a little warmth if for no other purpose than the dispelling of damp. It would be rather tedious at this season to detail the full culture of this plant, but, briefly, the soil for the final potting should consist of the best procurable fibrous loam three parts, sweet leaf-mould two parts, coarse, clean sand one part. If the loam is of very good quality nothing further is really required but a 5-inch potful of bone-meal and a 4½-inch potful of Thomson's Manure to each barrowload of the other ingredients is permissible and helpful. Pots must be quite clean and dry, and must also have a fairly liberal amount of drainage carefully arranged in each. Pot moderately firmly and set in a greenhouse or pit, shading from all sunshine. Give water with great care, and only when the soil approaches dryness. Good plants can be grown in 5-inch pots, while the 6-inch size will suit the very strongest. After the pots are well filled with roots weak liquid-manure should be given about twice a week. All the first flower-stalks should be nipped out as they appear, so as to encourage the plants to form good specimens. Plenty of fresh air is necessary, but no cold draughts.

CHRYSANTHEMUMS

A few pompon Chrysanthemums for the outdoor border

I should feel obliged if your able correspondent Mr. D. B. Crane would kindly give through your columns the names of a few outdoor border varieties of pompon Chrysanthemums having a short, sturdy habit, such as St. Crouts. A. SAUNDERS.

[Pompons possessing a sturdy, bushy habit of growth that are free flowering are the following: L'Ami Conderchat (creamy primrose), Flora (yellow), Mignon (golden yellow), Little Bob (crimson-brown), Mr. Selley (rosy-pink), Mme. E. Lefort (bronzy yellow), Percy's Seedling (old gold), St. Crouts (light pink), White St. Crouts (white), Mons. Herlant (bright red and gold).]

VEGETABLES

Vegetables for exhibition

"Terenure."—It is impossible with the space at command to go into details of culture of these vegetables so as to have them fit for exhibition in July, but, briefly, Celery should be sown in a warm greenhouse or frame early in February, and must never receive a check. It will be desirable to grow in pots of rich soil so that no check be given when planting out. Five-inch pots would be suitable and very rich soil necessary. Sow Leeks last week in January in rich soil, using well-drained pans. Prick off into small pots when large enough to handle, and later shift into the 4-inch or 5-inch size, using very rich soil. Both Celery and Leeks, of course, have to be eventually planted outside in richly prepared trenches. Kidney Beans, if the seeds be planted in a frame about the middle of April, should be ready, if well looked after, by the middle of July. They can also, of course, be grown successfully in 9-inch pots in the greenhouse, and both plants should be tried, and thus have a double chance.

LEGAL POINT

Holiday with full pay

I have been working for more than four years on the Ministry of Agriculture Experimental Station. Can you tell me if I am entitled to a holiday with full pay? The expert and foreman both claim holidays, but I am led to believe that I cannot. I have a cutting from a newspaper which says the Government has decided to allow a week's holiday with pay to all workpeople in Government industrial establishments. F. W. G.

[We have no means of knowing whether you are entitled to this holiday or not. It all depends upon the terms of your engagement. Why did you not send us the newspaper cutting you refer to? In any event, we would advise you to ask the person responsible for engaging you about the matter, showing him the newspaper cutting and asking him what the position is as regards yourself. If you do not get satisfaction, write us again with full particulars.]

MISCELLANEOUS

Book on town gardens wanted

(M. J. F.).—We know of no book dealing exclusively with town gardens, but think you would find "Beautiful Gardens: How to Make and Maintain Them," by W. P. Wright, helpful. Another and more important book is "The English Flower Garden," by W. Robinson, which contains a mine of valuable information. Both are obtainable from Bernard Quaritch, Ltd., 11, Grafton Street, New Bond Street, London, W. 1. Write to the manager of the Tully Nurseries, Kildare; he would most probably be able to arrange to supply any advice of which you may be in need.

Soil sample

(A. W. Smith).—We do not undertake complete soil analysis. If we did, it would serve no useful purpose, because, although chemical analysis will show exactly what chemicals are in the soil, it does not give any true index of the availability of the various plant foods, which is the real thing that matters to plants. We have tested your soil for acidity, and find that it is definitely on the acid side. Soils which are acid do not produce good crops of most things. Potatoes do fairly well in acid soil, but most other vegetables do not. Peas, Beans, and Brassicas often fail to grow at all; if the Brassicas do make fair growth, the plants are nearly always affected with Club Root. You should dress the whole garden with ground carbonate of lime at the rate of 2½ cwts. per 300 sq. yds., approximately 1 lb. per sq. yd. You will not, of course, apply the lime to the portions of the garden where you are growing plants which do not like lime.

Weed-infested lawn

I have an old lawn very badly infested with weed, chiefly Yarrow, Plantain, and Dandelion. What treatment do you advise for it? A. H.

[The only certain way to treat a lawn so badly infested with these weeds is first to clear off the whole of the turf, then dig the ground deeply, picking out all roots, and finally either relaying with clean turf or sowing down with fine lawn grass seed. If this cannot be done, the next best plan is to cut out the crowns of the Dandelions, and drop a little vitriol on each stump to kill the entire root. The Plantains may be killed by applying a good dressing of lawn sand, and this material may also kill the Yarrow. After the weeds have been got rid of, the whole surface should be dressed with rich, sifted soil, scattered evenly and well rubbed in with a birch broom. In April, grass seed should be sown liberally on all bare places. Frequent rolling will be necessary, and the lawn mower should be very sharp, so as not to tear out the young grass.]

School of Gardening in Northern Ireland

(M. J. F.).—We do not know of any such School of Gardening in Ireland, and advise you to address your inquiry to the Curator, Glasnevin Botanic Gardens, Dublin, who will, we feel sure, readily inform you if such a school exists.

SHORT REPLIES

F. B., Portadown.—Transplanting a newly grafted Rose tree: You may transplant your Rose during November with perfect safety. Reply to No. 1 next week.

Roy. — Rose Climbing Mme. Isaac Perriere: This may be obtained from Messrs. Ben. Cant, The Old Rose Gardens, Colchester.

F. W. Williams.—Lythrum salicaria is offered by Mr. Maurice Prichard, Christchurch, Hants, and Messrs. Cheal and Sons, Crawley, Sussex, and should be planted now. We advise you to write for their list of plants.

X. Y.—Roots of Lavatera: Although nothing can be discovered upon the root you send, we strongly suspect the damage as being due to Eelworm earlier in the season. We would advise you to dig Vaporite into your soil at the rate of 1 oz. to each square yard, and use lime more frequently.

NAMES OF PLANTS

F. S., Hampshire.—Roses: 1, Willowmere; 2, Mme. Lambard; 3, Mme. Ed. Herriot; 4, Mme. Hooste.

H. Mills.—1, Cotoneaster, possibly applanata, but a better specimen is necessary; 2, Juniperus communis horizontalis; 3, Omphalodes cappadocica; 4, Rubus australis.

A. W. A.—1, Oxalis Tropæoloides; 2, Hieraceum aurantiacum.

M. E. Hamilton.—Probably a Convolvulus, but a better specimen is necessary.

W. E. S.—Pyrus Aria majestica.

Trym.—1, Sedum spectabile; 2, Artemesia tenuifolia; 3, Juniperus communis.

W. Brandish.—1, Verbascum Weidemannianum; 2, Vinca minor rubra; 3, Senecio gibbosus; 4, Exacum affine.

F. J. Armstrong.—Agathæa cœlestis, a cool greenhouse plant which is often used as a summer bedding plant, and increased by cuttings struck under bell-glasses in the spring of the year. It may also be raised from seeds.

S. E. Hartley.—1, Pyracantha coccinea Lalandii (Fiery Thorn); 2, Cratægus Crus-galli (Cockspur Thorn); 3, Æsculus parviflora (dwarf Buckeye); 4, not recognised.

X. Y.—1, Cupressus Lawsoniana; 2, C. funebris; 3, C. Lawsoniana Fraseri; 4, Amelanchier vulgaris (Snowy Mespilus).

H. Mills.—1, Pyracantha coccinea; 2, Erica vulgaris var. tenuis; 3, E. ciliaris; 4, Ranunculus arvensis.

John Hindley.—Your plant is one of the Anarrhinums, of which about a dozen species, mostly of biennial duration, are known from Southern Europe and North Africa. They have little garden value and are mostly grown
for botanical interest, as they ar
allied to the well-known and show
rhinums. They are all easily grow
nary garden soil, but are not reliabl
and not worth bothering with from
den point of view.

THE BOOK WITH A GREAT REPUTATION

A Complete Encyclopædia of Gardening Lore

THE

GARDENER'S ASSISTANT

By WM. WATSON, F.R.Hort.S.
Curator of Kew Gardens.

This work is unique in that it leaves nothing unsaid. It answers every gardening query definitely and fully both to the amateur and to the professional gardener.
Every problem solved—every process explained in this comprehensive work. It is written in plain every day language, pleasant to read and easy to understand.
Twenty-two Experts—each a specialist in his subject—have assisted Mr. Watson in compiling this "university of gardening lore."
To possess it is to intensify the pleasure of gardening a hundredfold.
Special Easy Terms have been arranged to suit those readers who prefer to pay for the work gradually.

READ WHAT YOUR PAPER SAYS:
"We regard it as the soundest and best general guide to practical gardening published in our time. Without it the gardener's bookshelf would be incomplete."—*Gardening Illustrated.*

Satisfied Customers' Appreciations

"I can recommend the 'GARDENER'S ASSISTANT' to all seeking a full gardening knowledge." *(Signed) J.E.B.*

"A sound investment that will bring a handsome return." *(Signed) GEO. B.*

"No gardener should be without them." *(Signed) O.P.*

"The best book any amateur or professional gardener could possess." *(Signed) J.B.*

Where Late Work Is Good

E have now reached a period when fruit should be gathered in, but many people who were alarmed by Apples ng from the trees, were picking late ees as early as the first and second weeks tember. This may not be too early me early mid-season varieties, but for which we wish to keep until Christmas r it is too early. My Cox's Orange , in consequence of having a cross-ting variety near to them, hang like s of onions," so thick, indeed, that r they were not thinned they are small, e point is that these fruits will still be nd juicy in February equence of being still trees at the time of (October 14th). My e bush, cordons, fan-, and espalier trained Paradise stock, and only on these four that one dare keep n the trees so late, ds would blow them rom standards.

e wish the very late- varieties, such as Hindlip or Saltcote , to keep crisp and until April, we must em on the trees as possible. "As late sible" means, until art readily from the nd this year I shall k my Lord Hindlips out October 21st.

disadvantages from king of fruits is that a proportion from acks of birds, and all which have to be rlier, but it is worth sacrifice in order to that exquisite flavour cannot be obtained in ght fruit from overseas, picked in an p condition, and packed in the musty a ship.

assing, it must not be forgotten that fruit firm and juicy until late a dry hopeless.

arth floor of some sort is best. Few rs have a proper fruit room, it is not ry, but a cellar or shed not open ays of the sun is far better than a dry here fruit is often stored.

lay of our advisers on gardening matters h lay press emphasise the importance of early planting of Roses. I would like to minimise any urgency. If Roses are dug up while in growth, these soft shoots all die back and look unsightly, although no damage to the tree may occur. A well-known store was selling Roses early in October; this means that they were dug up at the end of September. The purchasers of many realise that sometimes it is better to be late rather than early. Roses should by all means be ordered at once in order to secure desired varieties, but there is no urgency in the planting of them.

While fruit trees may be planted until March, some trees, such as Hollies, are better planted then than now.

Growers of perpetual Carnations are sometimes too anxious to take cuttings. If *good* cuttings are available now they may be put in, but otherwise until good cuttings are available, February and March cuttings may make better plants.

Even seeds may be sown too early, and a common example of this is the Tomato. Many sow these in the winter, but while a few early ones may be obtained, poor, spindly plants often result in consequence of lack of sun. Main batches sown at the end of February or early March make much better plants later on, as they develop with the lengthening sunny days. A. S.

New Apple Saltcote Pippin, well shown at the recent R.H.S. Fruit Show

Award of Merit, 1928

Fruits juicy and of delicious flavour; a good dessert Apple to follow Cox's Orange Pippin

Reliable dessert Apples

I see a new Apple is announced of the Cox's Orange type, which will enable us to enjoy that particular type the greater part of the Apple season, and will doubtless be very acceptable; but, still, I do not think I should want to be without some of the firmer-fleshed Apples, like Ribston and Cornish Gilliflower. However, as there is something wanting in all these very high-class Apples, either they do not take readily to some soils and situations, or are decidedly shy bearers, I should always advise small growers to plant a few more varieties which, if not quite up to the standard of those above named from a quality standpoint, are excellent Apples, and can be relied on to crop consistently and well. I think my choice would fall on James Grieve, Allington Pippin, and Mabbot's Pearmain in their respective seasons. The last named is a great favourite in this district, where it produces fine fruit of excellent quality. Allowed to hang as long as possible before gathering, it will keep sound and good until some time after the New Year. E. B.

Bucks.

Ornamental vines on metal

A row of posts and chains covered with ornamental Vines can be a very handsome feature in the garden. Some growers believe that plants do not succeed on chains or iron posts. This has not been my experience, for I have always had my chains and posts well covered and a gorgeous display of Vines in autumn. As soon as the chains and posts are furnished with main growths all laterals must be pinched back in summer and pruned in autumn, so as to produce spurs which send out numerous shoots, forming a dense mass of foliage. It is surprising, when once established, how little attention is required to keep the growth in order. A few effective varieties are Vitis Thunbergii, with very large leaves changing to yellow and crimson in autumn; V. purpurea, the foliage of which turns to deep purple; V. Coignetiæ, good, with robust growth; and V. armata and V. Wilsonii, both of which possess very neat and pretty growth.

Eritrichium nanum—collected plants

I NOTICE that, in replying to a correspondent, you state that "collected plants of Eritrichium nanum will be a hopeless proposition."

A collected plant of Eritrichium nanum, successfully grown and flowered by Mr. Roger Bevan

The flowers are of a lovely sky blue, and the plant, which occurs at a very high altitude in the Alps, is notoriously difficult to cultivate

Such is not my experience. I find that collected plants offer the best chances of success, provided they are sent off immediately after collecting by "sample post," which only takes three or four days from Switzerland or Italy. They should be packed with no earth on the roots, and only *very slightly* moistened.

On arrival, the plants are put in a frame of very rough, coarse, gritty river sand. This stimulates them to re-root rapidly, and they can usually be potted up about a month after arrival.

To tide over the winter, they are potted up in the Alpine House in a mixture of river sand and granite chips, and kept very sparingly watered (never on the foliage, of course). It is also helpful to pack at least an inch depth of granite chips round the collar of the plant, thus reducing the danger of rotting off.

If the plants have survived the winter safely (I usually lose about 30 per cent.), they may be potted into a mixture containing a little humus as well as the chips and grit. The mixture should never contain more than a quarter of loam, however, as the essential aim is always the most porous medium possible. Such repotting may be done at the end of March.

At that time the plant is just waking up, and demands more water. This is best given by standing the pots in saucers, which are filed periodically, and it is astonishing how often this has to be done.

Under this treatment Eritrichium should flower all right, but, of course (owing to lack of rest and mountain air), not as freely as on its own wind-swept heights. One of my plants (of which a photograph appeared in GARDENING ILLUSTRATED) carried 32 flower heads this spring, and none of my collected plants failed to flower altogether.

I find that it is not the colour that deteriorates in lowland cultivation so much as the size of flower. The shade of blue compared favourably with the best coloured Forget-me-not I could find, but the size is roughly half what it should be.

Seedling Eritrichiums can be raised, especially if the seed pots are given a dose of snow during the winter, but my best seedlings are always self-sown in other pots in the Alpine House. It is difficult to raise seedlings beyond the single rosette stage, however, as transplanting is such a delicate business.

A "sporting" Dahlia

I have three different Dahlia flowers on one root. I do not know whether it is a very uncommon thing, but it seemed to me to be, as I have never seen more than one sport on one root before. It appears to be Fire Dancer, G. H. Barlow, on a root of Ballet Girl, all three in flower now.

The Death's-head Moth

By reason of its uncommon markings, the Death's-head Moth usually causes a sensation when it makes its appearance, and, during the course of the present year,
numerous specimens have been subm
me, from widely-different neighbou
for identification, as, in a humble wa
fond of entomology. The Death
Moth, known correctly as Acherontia
is much more common than it is p
supposed to be, and I have observed
caterpillars are very often found feedi
the foliage of Potatoes, although t
never sufficiently numerous to do a gr
of harm. The moth is one of our
native insects, and it would be intere
learn if it has been observed to be mo
ordinarily numerous during the prese
in other districts.

Cyananthus lobatus

hould like to add my testimony to Mr. rld's tribute to Cyananthus lobatus as a sable Gentian-blue rock plant, and, if pos- l to allay Mr. Fisher's doubts on the point olour. Whatever may have been the plant ıw at Kew, there is no doubt as to the Gentian-blue of the flowers which are ionally exhibited under this name at the IS. Shows. I have also seen the plant in r in Mr. Wells' nursery at Merstham, feel sure that, seeing the brilliant colour a distance, most people would hasten e steps to look at "that beautiful ian," and, moreover, would not be dis- pinted when they read its name at close ters. F. WYNN HELLINGS.

Ingston-upon-Thames.

Celmisia seed

Seing an illustration of Celmisia coriacea ıe number dated June 15th made me oler if any of your readers would care to some seed of it, or other varieties. I a cottage in the mountains and a hobby ollecting seeds, so would be glad to send ıyone interested. This illustration is of eargest variety. They go down in sizes to e tiniest—Celmisia laricifolia, really a r with leaves the size of a Larch needle, ca Daisy to correspond.

A home for Alpines

I vas gratified by the encouraging words Ir. W. Th. Ingwersen (issue September 3t page 657) about the old Rhus Cotinus, reading the kind words about it and ıegarden as a whole, I wondered if you od allow me to tell you something about ock garden itself, or, rather, the rock ens, as Mr. Ingwersen calls it, for the en so lies that it has gradually grown different gardens, which we call (1) the l rockery," made out of the local rock h is got hereabouts, (2) the "grey ery," all of which is old worn limestone Westmoreland, and (3) the rest consists valls made of a mixture of whatever we could get.

w, after nearly 10 years, all these parts had time to get covered, and I think n say that we are never without some- ng lovely to enjoy. Even in the coldest ter or after a long drought like the past summer, there is always colour. But I tell you all this simply to express my gratitude to the writer of "Rhus Cotinus," who has built every stone of it, and I can assure you that if every flower was gone, the rockwork would still be beautiful.

If anyone is planning a garden, big or tiny, I will gladly show them this one, but, alas, seeing is not enough, for it is really the work of a genius. Mr. Ingwersen not only lays every stone himself, but does the work artistically and yet practically. Many rock gardens are lovely, but not always good homes for precious Alpines.

V. CAVENDISH BENTINCK.

The Cottage, Dawlish, Devon.

Irreconcilable Alpines

On page 674 Col. A. H. Wolley-Dod, the son of an old friend of mine and great gardener, speaking of difficult Alpines, mentions my garden here (which, in reality, is an Alpine nursery), and asks whether we are successful with high Alpines. Alas, less than yourself in most parts of England, as our continental climate is too hot and too dry for some treasures as Eritrichium, Alpine Androsaces, Primula glutinosa, etc. These we may grow in pure Sphagnum, and I have given the culture of this kind in my books on Alpine cultivation. What my late friend Farrer and now all the English-speaking gardeners wrongly call "the moraine" is the application of the same system, watering from below. It is watering during heat which kills the high Alpines. This is the worst thing for them I am now, after 60 years' practice on Alpines, certain.

We are here at 400 metres altitude, but our garden at St. Cergne on the Jura is at 1,000 metres (3,000 feet), and there we are able to grow some of these rare things better than here, and especially in our walls there, where Androsace Charpentieri, helvetica, glacialis, Hausmanni, hirtella, Wulfeniana, succeed rather well.

H. CORREVON.

Geneva.

The Allwoodii Pinks Jean and Rufus in a Newquay garden

The National Carnation and Picotee Society

I understood that the Northern Carnation Society was not out for cheap publicity, but the Hon. Treasurer of that body having retired from the fray, I note that the Hon. Secretary has taken up the pen.

I indicated that my previous letter closed the matter, but I feel compelled to answer the communication by Mr. Secker, particularly as he quotes from letters which have not appeared in the Press.

The Northern Carnation Society was founded not more than seven years since, a fact which is confirmed by their Sixth Annual Report, issued this year, whilst the National Carnation and Picotee Society disseminated its *fiftieth* annual report a few months ago.

I repeat most emphatically that the Northern Carnation Society is not and never has been the Northern Section of the National Carnation and Picotee Society, which is the only body now running (date of inception 1877) entitled to bear the title N.C. and P.S. Many, many years since there were three societies connected with the Border Carnation, but two became defunct. The National Carnation and Picotee Society (of which I am the Hon. Secretary) does not exist under a false title, neither does it infringe the copyrights of any other organisation. I suggest to Mr. Secker that, in future, the Northern Carnation Society (working under the wrongly assumed title of N.C.P.S. [N.S.]) should refrain from issuing colourable imitations of this Society's publications, and work under their proper title, N.C.S.

Being economical, the N.C.P.S. is still using up the old forms and stationery printed many years since, hence the reason for the N.C.S. receiving an old receipt form.

My action in protecting the interests of the N.C.P.S. has been *unanimously* approved by the Committee of this Society.

A. E. AMOS, Hon. Secretary,
National Carnation and Picotee Society.

New certificated Chrysanthemums

An interesting series of beautiful Chrysanthemum novelties was submitted to the Floral Committee of the National Chrysanthemum Society, whose meeting was held in the Committee-room of the Royal Horticultural Society, Greycoat Street, London, S.W., on Monday, October 21st. Varieties receiving First-class Certificates were :—

MRS. W. HALL.—A large exhibition Japanese bloom measuring about 8 inches across. The florets are long and broad, and build a bloom of good, reflexing form, the florets curling and incurving at the ends. Colour, deep rosy-mauve with silvery reverse and silvery centre. Shown by Mr. W. Hall, Enton House Gardens, Witley, Surrey.

LUSTRE.—This new variety is of true incurved form, having fairly broad florets neatly and evenly incurving, and building a bloom of considerable promise for exhibition or for cut flowers. Colour, silvery-mauve.

RED CAVELL.—A glorious sport from Edith Cavell, and a bloom that is sure to be valuable to growers of exhibition blooms. The florets are long and broad, and build a flower between 9 inches and 10 inches in diameter. The colour may be described as reddish-chestnut with old gold reverse and old gold centre. A most effective bloom. Shown by Messrs. Keith Luxford and Co.

MRS. SARAH KNIGHT.—This is a welcome addition to the Japanese section, suitable for market or for disbudding. The flowers are about 5 inches to 6 inches across and the florets are of medium width and pointed. The florets reflex in very even form and build a bloom of exquisite decorative character. Colour, bright rose. Stems, stiff and erect. Small foliage.

DAZZLE.—A most welcome addition to the free-flowering Pompons. The flowers were shown in freely flowered sprays of considerable decorative value. If disbudded this should be a Pompon flower of good quality. Colour, crimson. There were as many as 20 blooms on one spray. Height, about 2½ feet. Shown by Mr. H. Shoesmith, Junr.

MRS. J. W. STONE.—A beautiful primrose-coloured sport from the well-known white single-flowered variety, W. Smith. The flowers are about 6 inches across, having fairly broad florets evenly arranged around a neat, well-proportioned, golden disc. Shown by Mr. H. Robertson, Abbey Road, N.W.

D. B. CRANE.

Plagianthus Lyalli

I ENCLOSE a photograph of a bush of Plagianthus Lyalli which is about 10 feet high and covered with flower. This place is 838 feet above sea level, and the plant seems quite hardy, if planted in a sheltered spot, and is easily struck from cuttings.

MRS. ANDREW SMITH.
Whitchester, Duns, Berwickshire.

Zauschneria Californica

This plant, which is otherwise known as the Californian Fuchsia, is a most beautiful subject for the rock garden. It has been in bloom in my garden for fully one month, and at the moment of writing (October 18th) it is as bright as ever. The colour, which is a glowing scarlet, is particularly welcome in the general planting scheme. I find that the Californian Fuchsia rejoices in a medium, well-drained soil, and an effort should be made to conform to these conditions when preparing the pocket. Late November and early April are excellent times for pl Personally, I prefer the former, bec saves the plants from suffering in the of a dry spring. Propagation is effected by means of cuttings, which be inserted under a bell-glass or cold June is, perhaps, the best month for sertion of cuttings, which should be p from fairly firm growth. If encoura is given, the young plants should be for the rock garden by November.

Plagianthus Lyalli flowering well in a Berwickshire garden

From Gardening Illustrated

Fifty Years Ag

Apples for market

THE present season has been markable as regards the fluc ations in the market prices fruits, and more especially the comm orchard kinds, for although a light c generally, some kinds are much bel the average, while others have p duced a crop double that of ordin years, the most notable being Appl that are at the present time selli wholesale at from 8s. to 10s. sieve; this is an extraordin price, for if large kitchen App are worth 1d. each in the mark they cannot be retailed at anythi like a reasonable price; ab here moderate-sized trees of Ston Apple have realised £2 to £3 per tr On the other hand, Pears and Plu are below the price of some seas when fruit is much more abundant a decidedly below the average as rega quality; still, it seems singular t Pears and Plums are only worth ab half the price of Apples that equally below the average in point view. I have no doubt that this w give an impetus to Apple planters depend even more largely than ever the king of hardy fruits, and t Apples will, to a great extent, suppla Pears as Standard trees. I find he that even the largest growers gradually reducing the number of sor and making a selection rather than collection of varieties is the plan n adopted. The very early or very la sorts are the most sought after, as th always sell well, while the mid-seas kinds are those that glut the mark and bring prices down below a munerative point. At present, fr culture for market is only in its fancy, but promises to assume lar proportions.—J. G.—*October 25t* 1879.

Gardening in the parks

This has been a wretched season f "sub-tropical plants" in the park Perhaps a few more such seasons m teach the lesson that, as regards publ parks, it is better to attend more hardy trees, hardy flowering shrub hardy florists' flowers, and the nume ous herbaceous plants now in cultiv tion than to spend so much money the erection of villages of costly gree houses which are devoted to the cultur of tender exotics. These, after all th trouble and expense they occasio often present a miserable aspect eve for the few months they are visible.— *October 25th*, 1879.

Early Autumn Colour

THE prolonged drought was broken early in October, and all plants look happier. Many trees and shrubs had begun to ne their leaves through dryness and I began o worry whether there would be any left or autumn colour. A week ago a terrific al sprang up which threatened to finish ff all foliage, but in spite of this there is o-day (October 15th) quite a lot of colour n foliage and fruit. For fruit there are sa Moyesii and its near ally R. argesii, R. pomifera. Of the Crabs, Cheal's rimson and Veitch's Scarlet are very at- ractive with masses of brilliant coloured ru. John Downie was good, but the birds ve had the fruit, no doubt being hard put o finding food in the dry September. The ees of the two former were recently prayed, and possibly there may be some eason for their leaving the fruit alone due o this. Pyrus Malus purpurea and P. M. lki are both good. The latter seems righter in colour and more plentiful. P. M. eera has been a mass of small Cherry-like ru, but has been raided by the birds. P. Sargentii has been a mass of brilliant carlet fruit, and now the foliage is turning rich butter yellow.

Of the huge family Cratægus there are many fine fruiting forms. Just now the best re C. saligna. Such is the plant's name as received. The fruits are larger than any other that I have seen so far, and the foliage s now very bright—a mixture of orange and red For fruit, C. prunifolia splendens is ery showy. C. Jackii, C. persinnilis, C. ubrivensis are some of the best. For oliage, as I write, I select C. ferentaria, C. losa, C. gemmosa, C. macrantha for hades of orange, yellow, and crimson. C. llangeriana has rich yellow and brown autumn foliage.

Of the Acers, so far, the Japanese Maples are limited to A. japonicum laciniatum—a sheet of solid, brilliant crimson, and A. dissectum and its varieties ornatum, purpureum, palmatifidum, which are all showing rich colours, orange, gold, and crimson. A. Ginnala was severely tried by the drought and the gale of last week and many leaves fell before colouring, but it still shows plenty of orange and crimson foliage, as does also A. spicatum. Close beside them is Pistachia sinensis, a vivid crimson, every bit as brilliant as A. japonicum laciniatum. It is early yet for the Berberis, but one is already outstanding, and that is B. Sieboldii, as bright a scarlet as any Guardsman's tunic. The true plant is rare and quite unmistakable.

Of the large family of Cotoneasters there are a few already at their best. For fruit I select C. Franchettii, and its pretty grey foliage is not the least attractive part of it.

C. bullata, good foliage as well as berry. C. Dielsiana, C. Farrer sp. 1325, a very nice plant in foliage, berry, and habit. C. lucida is particularly bright in its coat of autumn colours of crimson and orange. Many others species will be better a bit later on.

Azaleas show a wide range of colour—yellow, orange-red, or crimson, and few equal A. pontica for richness. Viburnum tomentosum plicatum is a gorgeous crimson, the var. Mariesii being almost as good, but wants a few more days. V. cassinoides is showing some good colour in some of its leaves, and V. Carlesii is quite bright, but I think dryness at the roots has not agreed with this latter. Pyrus Tschonoski is showing rich orange and crimson colourings, and is a plant one seldom sees. Stephanandra Tanakæ is a bright yellow and its brown stems are attractive—and this is somewhat similar to Neillia longiracemosa. Hamamelis virginica is turning to a bright yellow which rather hides its yellow flowers now open. H. japonica rubra is a blaze of orange and crimson, and H. j. Zuccariniana was quite good, but dropped its leaves ten days ago, due to the drought. Close by are the Fothergillas. F. Gardenii is the least showy here, owing to its leaves colouring, one might say, each in its turn; the colour is fine, but there is not sufficient on the plant at any time to equal its neighbour F. monticola—a blaze of crimson. F. major turns a bright rich yellow.

On the house there is a fine form of Vitis inconstans—possibly var. purpurea—it is colouring earlier than the type and is much richer and deeper in colour. Vitis Coignetiæ is a wonderful colour, and growing in the shade is V. Thunbergii which has given an almost self deep rose colouring. Pieris Mariana is beginning to colour and will continue to carry its foliage right through the winter if the weather is not too severe. Gaylussacia baccata—or G. resinosa it should be called perhaps—is a brilliant crimson, one of the best bits of colouring there is. Young plants of Stewartia pseudo-camellia are quite a pretty deep rosy shade. Cornus florida and its var. rubra are already turning a vivid deep rose and very bright at a distance. Beyond, in the wood, is Pyrus (Sorbus) torminalis changing from green to yellow-orange and rich brown shades. One of our most attractive native plants for autumn colour.

Euonymus provide both autumn foliage and fruit. Our common Spindle Wood is very attractive with its deep pink fruit and yellow seeds. The form of E. europæus, known as Brilliant, is very bright in its deep rosy red autumn foliage. The var. atropurpureus gives a beautiful effect of purple and crimson. The two coloured berry forms, E. fructo albo and E. fructo coccinea, are well worth growing, though the former

Clematis Davidiana
Flowers grey-blue in dense clusters

is, of course, less showy. E. alatus is one of the earliest to colour here and gives a grand show of rose changing to vivid crimson. E. lancifolius, an evergreen species, gives pretty rose pink effects to its dying foliage, but these are rather few. Two species, E. latifolius and E. planipes, are very much alike, but they are unlike in the toothing of the leaves, and the fruits are quite distinct. The fruit is very much larger than that of E. europæus, and colours and splits open earlier, but the foliage has not yet changed to its autumn colouring. E. oxyphyllus has turned early this year, due to drought, the leaves changing to a rich deep rose. E. yedoensis has a softer shade of rose in its foliage, and the fruit is nearly as bright as E. europæus fructo coccinea. Pyrus arbutifolia, the American Red Chokeberry, colours early and gives brilliant scarlet colouring. Hippophæ rhamnoides is very attractive with its mass of orange yellow berries in amongst its silver foliage, and they are berries which the birds do not seem to like. Disanthus cercidifolius, a rare shrub allied to the Witch Hazels or Hamamelis, has begun to take on its wonderful autumn colouring when its big heart-shaped leaves turn to deep claret and brilliant crimson. The Pernettyas are beginning to show colour in the berries, and the white form is very attractive. Prunus Sargentii gives as good a show in autumn as it does with its young foliage and flowers in spring. It is now giving gorgeous shades of orange, gold, and crimson, and some young bushes are a solid crimson mass. P. incisa changes from green to gold to red, and will be at its best in two or three days' time.

Early next month I hope to complete a further note of those not mentioned here which have not, at the time of writing, shown their full glory. F. K.

Clematis Davidiana

THIS herbaceous Clematis is a plant of much interest in the late summer, its blooming season being near the end of August. It is nearly related to the less ornamental C. heradeæfolia tubulosa, of which it is considered to be a variety, though by some botanists it is given specific rank. The flowers are produced in dense clusters, each separate flower being like a small Hyacinth bloom on a half-inch stalk. The clusters are largest near the top of the 3 feet to 4 feet high stem, and are so closely packed with bloom that it is impossible to count the individual flowers. At intervals up the main stem there are side-shoots from 6 inches to 8 inches long, crowned with a cluster of flowers 50 or more in number. These shoots spring from the axils of the large, single, rather vine-shaped, three-lobed leaves. These handsome leaves are dark green and so deeply veined that the surface has a rugose appearance. Clematis Davidiana is described by some authors as spreading or even trailing; the plant, as I have it, from, I think, a Continental source, is anything but spreading; it is starkly upright and needs no staking or any kind of support. The colour of the bloom is a kind of grey-blue; not quite a pure blue, but a good bit bluer than Ceanothus Gloire de Versailles or Trachymene cœrulea. G. J.

National Sweet Pea Society

Alteration to Rules at Annual Meeting

THE annual general meeting of the National Sweet Pea Society, which took place on Wednesday, was, for the first time, held outside London proper. By courtesy of Messrs. James Carter and Co., the dining room at their Raynes Park seed establishment was placed at the disposal of the members, who were, prior to the meeting, entertained to luncheon by the retiring President, Mr. Harold Beale. Following the luncheon and preceding the meeting, the members were conducted round the trial grounds and premises on a tour of inspection

Mr. Beale occupied the chair at the commencement of the meeting, and, on his suggestion, the entire gathering stood for a moment in silence on learning of the death of Mr. W. Huffey, of Tonbridge, a member of the Committee.

The 29th annual report, which was adopted, stated the Society had had another successful year. The Committee were concerned that the number of trade exhibits at the two shows was less than in former years. The Annual Show for 1930 would be held in the New Horticultural Hall, Westminster, on July 8th and 9th, and it was hoped that a provincial Show would also be held. During the year 91 new members, including 9 Vice-Presidents, had joined the Society, and 12 kindred societies had become affiliated. On the financial side, it was stated that the condition of the Society continued to improve, the surplus of the year ended September 30th being £49 6s. 8d., as against £42 0s. 8d. of the previous year. The report concluded with thanks to all officers of the Society and friends who had assisted in any way.

Mr. Samuel Wallrock, of the Manor House, Stanmore, was unanimously elected President for the ensuing year. Mr. Beale, in vacating the chair, observed that he was of the opinion the ruffle varieties of Sweet Peas would, in a few years' time, succeed everything they had to-day. He was getting his firm to concentrate on the double standard Sweet Pea.

The Society's Gold Medal and a framed
autographed copy of a large group
graph taken at the Norwich Show we
presented to the retiring President in
ciation of his services.

Mr. J. Stevenson proposed alterati
Rules 17 and 21 of the Society. Th
rule read : "The Gold Medal of the
may be provisionally awarded to the
which the Society consider the best
Trials each year. . . . The variety wh
the time, appears worthy of the dist
shall be reserved for the Gold Meda
this shall be finally awarded the fol
season if the variety has kept true
and colour." Mr. Stevenson's propos
that in the first line the word "shall"
be deleted and the word "may" in
and that the word "provisionally
deleted, and also the last paragraph
Rule. This would, he explained, mea
the Gold Medal need not necessar
awarded each year, and also that
Medal were to be awarded it would
dependent upon the conduct of the var
the Trials the following season.
varieties, he claimed, were not worth th
Medal, yet they had to give the awar
further proposed that in Rule 21-
award of any kind shall be made to a
that, at the Trials, contains a rog
rogues," the words "a rogue or ro
should be deleted and the words "mor
one plant rogue" be inserted. Many
varieties, he said, got the "go-by" f

FRUITING SPRAYS OF BERBERIS

Left: Berberis polyantha, deciduous species, fruits red.

Centre: Berberis vulgaris (Common Barberry). The berries are too acid even for our native birds. At one time the fruits were considered a wholesome delicacy, candied or preserved in sugar.

Right: An unnamed seedling with an abundant crop of coral and salmon-red berries.

than one plant rogue. It would not , necessarily, that they would obtain an l, but it was his belief that by ruling out ies with one rogue they were missing of the best varieties in commerce.

. D. Allan seconded these two proposals, were voted on separately. The first arried without discussion.

aking on the second proposal, Mr. . Burt said the Society wanted to aim at ghest possible standard. If they allowed lant rogue, that would be one in 30 . How many would there then be in und? He considered the proposal a grade step.

er members spoke against the proposal, was, nevertheless, carried by 31 votes d 26 against.

the election of office bearers which en- Mr. G. H. Burt was elected Chairman e Executive Committee, Mr. J. M. eford was re-elected Hon. Treasurer, . C. Bartlett was re-elected Secretary, . S. Brunton was re-elected Editor of the al, and Messrs. W. G. Kay and Co. re-elected auditors. The Committee re-elected *en bloc*, with the exception ssrs. R. and T. Bolton and the late Mr. Iuffey. The following were elected to on the Committee:—Messrs. F. ord, A. W. Gower, F. J. Rogers, rling, F. Cotterill, O. H. Abbott, and olloway. The nine members elected by to serve on the Floral Committee —Amateurs: Messrs. C. Ball, E. H. ty, C. H. Curtis, W. Humphrey, and Rogers. Trade: Messrs. D. Allan, . Burt, A. Ireland, and E. R. Janes.

ober flowers in a North-East Yorkshire garden

HE recent rains, the first for many onths, have resulted in brightening up any parts of the garden.

day (October 12th) Zauschneria cali- a, known as the Californian Fuschia, is effective in masses in two positions, one back of a dwarf wall, the other partly Yews, both very dry, sunny positions. been in flower fully a month, and after cent rains is still quite brilliant with its mon vermilion-red flowers. The plants been in the garden for years, and in the mentioned position usually flower well, ever before so finely as in this extra- rily dry year.

the above wall top, which faces full t, the very pretty Helianthemum umbel- is in flower for the second time with rose-coloured flowers. Reginald Farrer s well of this Sun Rose with white s, and mentions that " a red-blossomed one has been found at Fontainbleau." In Bonniers' illustrated "Flora de France, Suisse, etc.," is Helianthemum umbellatum var. rubrifolium ("tres rare Foret de Fontainbleau au Mont Merle"), which evidently refers to this variety.

Another species, Helianthemum pulverulentum, which I have from seed collected in the Sierra Nevada, has a somewhat similar rose-coloured flower, as well as the typical white flowers; the plant, however, is more prostrate, and does not carry itself so well as H. umbellatum. The var. roseum Wk. is described in Willkomm and Lange's "Floræ hispanica," but only recorded for Piedmont and Liguria. In the later "Spanish Flora of Blas Lazaro e Ibiza," the flowers are described as white and sometimes rose. The rose-coloured flowers of H. pulverulentum were fairly common in and near the bungalow that I stayed at high up in an out of the way part of the Sierra Nevada mountains.

Origanum hybridum is a treasure for late flowering with its sprays of pink Hop-like flowers, a plant from Asia Minor that winters quite well in a dry position. Another Eastern plant, Æthionema venustum, which gave lavishly of its lovely sprays of light rose-coloured flowers earlier, has at present seed sprays which are noticeably effective.

The double-flowered form of Campanula haylodgensis which has been flowering for some weeks, has still a good show of its clear blue flowers, and is in its double form even more effective than the type. Campanula gargantica hirsuta is flowering for a second time, and Campanula isophylla is very effective with its large good blue flowers in a position it has occupied for many years.

On my "island" moraine, a few plants of the dainty grey-green dwarf foliaged Chrysanthemum radicans, originally from seed obtained on a visit to the Sierra Nevada, has some of its white and pale sulphur Daisy flowers, but, unfortunately, none of the deeper sulphur or yellow flowers that I saw and had some two or three years ago. Another Spanish plant in flower is Linaria melanantha, with striking deep mahogany red and deep purple flowers. The flower colours of this species vary considerably. Asperula arcadiensis, the prettiest of the Woodruffs, with its delicate, long, pink flower trumpets, is flowering again, as are also Campanula W. H. Payne and Hypericum polyphyllum.

However, the most showy plant at present is Felicia rotundifolia; this, on sunny days, of which we have had many more than usual, is very lovely with its delightfully good blue Daisy flowers, freely produced; these African Daisies, of which there are many, all beautiful, have to be treated as annuals, as they are not likely to stand through the winter. Some may say these are not moraine plants; this is admitted, but they are useful, especially as odd plants rather than in mass, to carry on the delights of the moraine in the off season.

A feature on one corner of the moraine is a well-flowered clump of the deep purplish-blue flowered Crocus asturicus.

In other parts of the garden Linarias are still attractive, all pretty and flowering over a long period. They include Linaria maroccana, with its purplish-red flowers. L. bipartita, some with good blue flowers, as well as violet-purple, and odd dainty white-flowered specimens; L. broussonetii with its dwarf erect yellow flowers, a species from Andalucia; L. origanifolia, originally from seeds collected in the Pyrenees; L. verticillata, a pretty prostrate yellow-flowered plant with deep green foliage that I obtained in the Sierra Nevada; L. supina from the Pyrenees; this seeds itself too freely and may become a nuisance, it also crosses with and dominates other species near. L. alpina flowers and seeds itself quite well; a mass of it at present has a few of the pretty rose-coloured flower specimens, but, unfortunately, no white flowers appear.

All the above come up from self-sown seeds, but it is always safer to collect seed and sow some where required early in the spring.

Sedum spectabile is always interesting, especially the paler pink flowered variety, coming into flower in the autumn and attracting to itself butterflies, bees, silver y moths, and flies innumerable. This year Buddleia variabilis flowered at the same time, and proved for a time more attractive to the beautiful Red Admiral and small tortoiseshell butterflies.

The recently introduced Œnothera tricocalyx with white flowers is flowering well and is quite one of the best of the Œnotheras for the garden.

Bulbs have been later in flowering than usual, evidently waiting for rain; this came a little over a week ago, and almost immediately Crocus speciosus commenced to push up, and its flower masses are quite attractive. Crocus zonatus came up earlier in one position, but in others it is just appearing; out of a large number of seedlings, odd flowers are almost white. Crocus granatensis, the form of C. nudiflorus, that Maw includes in his monograph for the Sierra Nevada mountains, was collected in 1924 and 1926 out of flower, 6,000 feet to 7,000 feet up in the Sierra Nevada, and flowered for the first time last year and again recently. A few Crocus pulchellus are in flower, also in a position on the moraine, the pretty Crocus hadriacus, with pale bluish white darker pencilled flowers, and just appearing with its dark purplish-blue flowers is Crocus medius.

My Colchicums are mostly past the best; C. bornmulleri and C. giganteum flowered in early September, followed by C. speciosus with its fine white flowered variety, which flowered later than the type. Also C. byzantinum and a similar Colchicum received as C. veratrifolium. C. autumnale has been flowering freely, including white and double flowered varieties, the latter just coming into flower.

The Colchicums are very nice to h
flowering, but they are somewhat unt
Cabbagey when in leaf.

T. Ashton Lofth
Linthorpe, Middlesbrough.

GLADIOLI

When and how they flowered in 1929

By Major George Churcher, President of the British Gladiolus Socie

John Alden and Zona, two promising Gladioli

THE ground was well trenched in the autumn and left in a very rough state on top, and the severe weather of the past winter had full play with the largest portion of the top spit. The result was, when worked down in the spring, a bed as near perfection as one could wish. Planting began the second week in April and continued, at intervals, until May 14th.

The first spike to open was one of Break o' Day, described by the raiser as an extra early one, which was justified on July 20th. The colour is a pink flushed over a cream ground, shading deeper to the edge of the petals. The zone of yellow on the lower petals throws up the pink, and the flowers are not too large to give a very effecti
for the dinner-table.

On the 22nd appeared a new one
form of Mandarin, a rich salmon-
with yellow throat. It ranks as a Prir
grandiflorus; it is tall, nearly 5 feet, a

time, a nice pink Primulinus of early) introduction, which bloomed on this as did Buddy Worden, an orange; rnia Lou should appeal to those who r the P. g. type, being a flower of good bance, of an old rose pink colour. Sun , a large-flowered orange-salmon was the one to open on the 3rd; the old rites, Giant Nymph, Henry C. Gohel, Sunnymede pleased the eye on the 4th, her with a new one, Adair, a cream iated variety; while the 5th produced salmon-pink; White Butterfly, the best most reliable white Primulinus, in my ion; and Sovereign, the largest and one best, if not the best, of the dark blues. at burst of colour came to view on the with Dr. van Fleet, B. W. Williamson, nto, and Dewdrop, with Robert J. lerd, a very fine deep vermilion, but not d doer with me. I have tried it several and have come to the conclusion it make way for something more reliable. Lily did not do its best to come up to its ogue description, but Yellow Prince was good. White Orchid will have to be n again before one can decide for or st it. Fire Pink (1929), not very lnamed, produced a spike well set with rs more salmon than pink. Another of aciniated group is Aquilla, deep cream. the rush of the previous day, the 7th Temblor only. This variety was a com- failure last year, but this year, planted xto Virginia Lou, it grew as strong as its bour, and produced beautiful spikes of salmon-red flowers.

Mady Imogene confirmed my previous ion of her high merit on the 8th; and alie Boy was gay in grenadine pink; ts, cream edged with pink, makes a good flower; Gregor Mendel attracts in his ale of purple, while Margaret Moor looks in crimson. Elfin and Forest Sprite also in evidence on this day.

at great favourite Ada De Poy made her on the 9th, and continued to hold the stage until the second week in September. Creatore came up for judgment on this day. It is a large open flower of a pretty pink shade. It will appeal successfully to those who like size. Butterboy, judging from previous years, made a somewhat belated appearance. Swiss Maiden also made a great impression on this day. Sunburst was the only new arrival on the 10th, a pleasing flower, and although of Primulinus origin, the blooms are wide open, of good substance, and mounted on wiry stems.

Freckles, orange-salmon Prim., Lucifer, a large flowered peach-red with a yellow blotch, and Trooper, a P. g. of geranium-pink, very tall and commanding appearance, were in attendance on Mrs. W. E. Clark on the 11th, while Purple Butterfly looked longingly at the large and open pink Arbutus.

The 12th was a great day; Mary Pickford with Bridal Veil and Shell Pink came forth with Copper Bronze, Reo (dark ruby red), Scarlet King (very intense scarlet), Marlboro (orange), with Tommy Atkins (bright scarlet) in close attendance; while Mrs. Chas. Stevens (1929) in mallow purple with darker slashings stood up before Orange Fire (1929), a large-flowered orange vermilion, and looked on Honey Dew (1928), a laciniated salmon orange splashes on yellow, with Yellow Wonder, and Oneta, a good orange, developed on the 13th with the Remarkable (cherry-rose), Stippled Beauty (salmon rose pink), Eldora (cream). Helen Howard arrived two days later (14th) than she did last year with a Glory Flower of rose lavender.

On the 16th, Midsummer Dream, much later than usual, appeared with Juniata, very straight-looking, creamy-white, shaded with La France Pink, in company with Gipsy Butterfly, a large open flower of vivid red with large throat blotch and feather. It recalls the large flowers of Lemoine of some years back, but has a stronger stem and altogether a sturdier flower. Genesee, a pale yellow P. g., produced better flowers than in previous years.

Black Pansy appeared about the average time (17th), and on the same day Hilary, an English variety raised by Mr. Bliss, was in flower, a medium-sized heliotrope. Iroquois, an American variety as its name would tell, is a good dark ruby red of medium height The only other flower to open on this date was the rather rich soft orange laciniated variety Golden Orange.

Captain Boynton, Fern Kyle, and Jacoba van Beiren were well up to standard on the 18th. Mrs. Laura S. Schweppe flowered very freely, but I could not feel satisfied that it was the same that I grew a few years back under that name. Harbinger (1929) is a strong grower with terra-cotta flowers, described as a landscape variety, and would appear to be very suitable for that purpose (Mr. Gibson notwithstanding). Persepolis (1929), difficult to describe, other than in the raiser's words:—"A combination of the purest of colours, all perfectly blended, and of most pleasing harmony." Syncopation (1929) may be best described as a miniature laciniated edition of Golden Frills.

Arlington, a new Kemp production of this year's introduction, is an orange shade which is attractive, and as the spike carries many flowers will no doubt be in demand. This with Purple Queen, a medium flower, gave the only excitement on the 19th, and Byron L. Smith, who usually appears quite early in the month, delayed his appearance until the 20th. The 21st brought nothing new, but Comet, 1925 Rose, an improvement on 1910 Rose, Opalescent, and St. Thomas were in bloom.

The next day (22nd), Arcadia (orange-pink), Blue Torch, Dr. Elkins, Fastidious (shell-pink), Helen Wills, Norwood (coral-pink), and Trilby were all checked as true to name, as was Jap Lady, which did better than in previous years—whether the bulbs will carry over to another year or produce spawn is another question. It is a difficult variety to grow. Of the newer ones Iwa was perhaps the largest in every way, the flower a rich pink with a large red blotch. Ridgefield

A border of Gladioli and Pentstemons, showing their good effect for landscape planting

Colchicums naturalised in grass in St. James' Park, London

Park, a Kemp 1929 introduction, is another orange variety with small peach-red feathering on lower petals. Orange Gold (1929), yet another orange variety but of a deeper colour, the blooms are large and open, a striking flower. Philatelia was a 1927 introduction of Kunderd's but an expensive one, and although the name attracted me I was content to wait awhile. The flower, a deep tyrian rose, drew immediate attention; the colour seemed to be quite distinct, and a bed of it would make a striking picture.

The white Tiffany was solitary in its appearance on the 23rd and, no doubt, felt that it was not wanted.

The 24th was in striking contrast to the previous day. It was the day of Pfitzer's Triumph, but there were others of commanding presence. Homestake will surely be among the best of Decorah's for many years to come. The ground colour is a rich pinard yellow, veined cornelian red, the lines getting somewhat heavier towards the edges; the general effect being a deep orange flower. I had but one bulb, but a second spike, with five flowers open was an outstanding feature in a bowl of Virginia Hale on September 14th, and a third spike was developing. Crown of Gold did not appear to be worthy of its name. Oraflame, another Kemp production (so spelt by the introducer, possibly because there is or was already a variety named Oriflame) is one more of the good orange varieties; although classed as a Primulinus, I should be inclined to put it with the Primulinus grandiflorus section. In Spider (Bill) we have another new form, with long, narrow petals. The flowers are of good size and make an attractive spike, and doubtless will be more popular than some of the laciniated varieties. John T. Pirie came into view on the 25th, in company with Muriel and Lucette, while Blue Isle could be seen in the distance, away to the left of Damascus. This last one was introduced by Stevens in 1928; it is something different, and not easy to describe, but the general effect of the flower is a rather dark but bright bluish tinted ashes of roses. The blooms are large and generally hooded. Striking both as to shape and colour.

Annie Laurie in pink came forth on the 29th; while Catherine Coleman, also in pink, appeared with Gloriana the next day. Gloriana is another flower which commanded attention at the Southport Show, and received a well deserved Award of Merit. I am glad to say my bulbs came true this year, although too late for Southport.

Du Ganne Delight made me sad on the 31st.

Violet Prince, a very dark violet red, showed up in contrast with Mrs. K. Prestgard, a pure white on September 1st, while Minuet, a lavender, looked charming with Piccadilly, a creamy yellow with amber throat.

Patricia, in La France Pink, and beautiful Virgina Hale were seen in company of the deep yellow Cleopatra on September 2nd, while Geneva Gem was in solitary state on the 3rd. This last is in the same class as Freckles, but a taller grower, and the colour is scarlet red, veined cream.

Apart from a few varieties which were planted late there are only one or two more to mention. Dr. F. E. Bennett was open on the 5th; Mrs. F. C. Peters, always a late one, but much later than usual owing, no doubt, to the long period of dry weather, did not open until the 7th. On the same day a new variety in Jane Addams of Decorah Gardens appeared. The colour of Jane is soft phlox pink with white throat, but it belongs rightfuly in the lavender class. The raiser states that "like many other varieties of delicate colour, it is apt to become flaked in sultry weather or sudden change of temperature, but when the colour comes clear, as it usually does, it is hard to find anything to equal it." Judging from my flowers the above statement may be taken as absolutely correct. The first spike had the flakes, but the later ones were clean and pure.

On the whole, the season has been a good one here. Naturally, in the peculiar conditions prevailing, some varieties have done better than others. Of those mentioned above, perhaps Sunnymede, John Alden, Priscilla Alden were affected by the drought more than most of the others, although Taj Mahal and Henry C. Gohel were not far behind. These were some of the earliest planted, and no doubt suffered from want of moisture in the early stages of growth.
planted later had the benefit of a go
face rain at the critical stage of grov

placed in a cool house or frame, from
they may be transferred to warmth
quired. These do equally well in Coco
or soil, and may be had in bloom in
21 days if forcing is resorted to. It is
ever, a good plan to stand the plant
cooler temperature when perfecting
flowers for a few days, as the lea
treated become greener and the flowe
stems stiffer, enabling them to last in
longer in rooms when cut.

Notes from a West Somerset Garden

plants have shown greater apprecia- ion of the dry summer and autumn than he Colchicums, which have been flower- ith exceptional freedom. C. alpinum d its first tiny flowers on July 20th, but gh I have kept it going for six years, it seems to increase. It was followed a ays later by C. cappadocicum, another ing little flower not easy to establish. dry weather delayed the appearance of rnmulleri until the second week of Sep- er, when they came up with a rush in nse to heavy thunder showers. They remained in beauty for three weeks, and own seedlings have appeared in unex- d places. The new race of Dutch ls is proving very valuable. A single of the variety Princess Astrid planted in produced 17 flowers this year and was distinct in its rich mauve colouring. nn Queen flowered a fortnight later and newhat paler. It was followed in the r week of September by Glory of Heem- d (the deepest of all), The Giant, and r Lily. This last variety is of outstand- erit and is aptly named. The soft, lilac rs are fully double and of great size and ance without any suspicion of coarse- It is apparently a good doer, as five s were carried by a single bulb recently d. C. speciosum and its incomparable i variety appeared at the end of Sep- er, as well as the attractive double white y of our native C. autumnale.

umn Crocuses did not appear above ud until mid-September, when C. zonatus up well and flowered with especial ness. A few corms of the lovely C. atinus have also done very well, though species does not increase with any free- When shrubs were flagging under the g sun in July and August one consoled elf by thinking how splendidly the Bella- na Lilies would respond to the baking were receiving and looked eagerly for uds to come through early in September. ta disappointment was in store, for of arge clumps under a warm wall only a ry flower-stem has appeared, and in a ontaining some dozens of bulbs about 14 d are all that are showing even now ber 17th). This is very different to the of 1921 (our last really dry summer), the Belladonna Lilies flowered (and set with exceptional profusion.

rine Bowdeni pallida, grown in a narrow r under a wall facing south, is flower- bundantly and is in every way superior te typical rose-pink form. The narrow- d form of Sternbergia lutea is flowering although overshadowed by the strong e of Gerbera Jamesoni seedlings, which revelled in the warmth of the sun. The variety of the Pomegranate is well set buds, but even this season's heat has not aded the ordinary Pomegranate to r.

a sheltered wall, with its roots shaded djacent shrubs, Mutisia decurrens has remarkably well and borne its glorious ge flowers to the delight of all who see M. ilicifolia has made rapid growth st a wall, but has not yet flowered here; he recently introduced M. retusa has d itself a very valuable addition to our ns. It is probably seen at its best when ed to ramble through some old tree, as ms absolutely hardy and does not need rotection of a wall, at any rate in ern England.

few bulbs of the Mexican Milla biflora potted up in the spring and kept in a house. They have been flowering since niddle of August, and are very lovely with their large, pure white flowers, delicately scented in the evening, poised on slender stems 18 inches tall.

An interesting Gladiolus species sent from Kenya has also flowered under glass. The flowers are green, with many reddish stripes, and very distinctly hooded. I do not know its name, but think it may be G. dracocephalus.

An unnamed Watsonia (raised from South African seed) has flowered in the open border; a lovely, soft, salmon-pink, slightly smaller than W. Ardernei. These seedlings were grown in the open throughout last winter without injury, so it may prove a welcome addition to gardens. The foliage of W. Ardernei was so badly cut by frosts that the bulbs have not flowered at all this year.

Kniphofia Nelsoni, the true orange-scarlet, slender species, from the Orange River Colony, is flowering lavishly in a half-shady position, where it is protected by shrubs from cutting winds. It is one of the most delightful species of the genus.

Mandevillea suaveolens on a south wall not only survived 17 degs. of frost last winter, but has flowered abundantly this summer, some of its exquisitely fragrant blossoms being succeeded by extraordinary double pods of seeds, very slender but about 14 inches in length.

The freshly split seed vessels of Pæonia Willmottiana, with the blue-black seeds embedded among scarlet arils, render this species almost as attractive in autumn as it is in spring, with its pure white flowers.

N. G. HADDEN.

West Porlock, Somerset.

Three Alpine gems

Readers who take a delight in Alpine flora are not likely to overlook the beauty of the encrusted Saxifrages. It is a beauty that is perennial. Even when the flowers are not open, the incrustations of lime on the leaves glitter like polished silver. For some years I have been building up a collection of encrusted Saxifrages, and if I were compelled to destroy all the species and varieties save three, my choice would fall on the following:—Doctor Ramsay, Cultrata, and Caterhamensis. The long, arching sprays of white flowers which the variety Doctor Ramsay bears are spotted with red, and the contrast is delightful. The snow-white blooms of the species Cultrata are the essence of refinement, and the silvery leaves add to its charm. This species opens in late May and June, and acts as a natural successor to Doctor Ramsay. My third favourite, Caterhamensis, develops its flowers in June and July. Tastes differ, of course, but I regard this as the best of all the encrusted Saxifrages. The spikes are often 2 feet in length, and the flowers are heavily spotted with red. I find that all members of the section appreciate a well-drained soil, which is moderately rich. An excellent compost is five parts of ordinary garden soil, and one part of well decomposed farmyard manure. The present is a good time to plant, and when the work is completed, the surface of the soil should be sprinkled with lime rubble. This substance will gradually wash in and serve a useful purpose in the life of the plants.

G. H. C.

Shrubby Potentillas

The ordinary Potentillas that are so useful for the rock garden and herbaceous border are well known, but little attention has been paid to the charming shrubby varieties. These are some of the most attractive of late spring and summer blooming shrubs, being neat in habit and exhibiting great charm in leaf and flower. The best time for planting is early autumn. Sun is the first essential to success with these Potentillas, an absolutely open and even exposed spot suiting them best, and a light but fairly rich sandy loam on the dry side rather than otherwise.

Although certain kinds would not, perhaps, be in stature suited for the small rock garden, they all might be useful where the idea of the shrub rock garden is carried out, as none could be said to be so rampant to threaten equally dwarf shrubs or plants adjacent to them.

The best known kinds are P. fruticosa, with sulphur yellow flowers; P. Friedrichseni, with yellow flowers; and the white variety, Veitchii. There are some well-marked varieties of P. fruticosa, one of which, P. Mandschurica, is smaller in all its parts, while P. rigida is even more procumbent in habit. P. Farreri is another form from Thibet. The first named usually grow into neat bushes about 2 feet in height.

REMINDERS FOR THE WEEK

Southern and Midland

Flowering shrubs in pots

There are many lovely flowering shrubs which, if potted up at the present time, will be found invaluable during the early months of the year. They may be lifted from the open ground, or purchased specially prepared for forcing. Hard forcing should not be indulged in, as this results in spindly growth and poor, washy colour. Such plants should be brought along gradually in cool houses until the turn of the year at least, when they may be subjected to somewhat higher temperatures. The following are very suitable :—Lilacs, Azaleas, Forsythia, Prunus triloba, Wistarias, blue and white, Deutzias, Spiræas, Viburnum Carlesi, V. fragrans, V. utile, Laburnum alpinum, Staphyleas, many Pyrus, and Rhododendrons. It is most important that such plants should be introduced to higher temperatures very gradually, otherwise many buds will fail to respond at all.

Vineries

Vineries containing ripe Grapes, which are of necessity filled with Chrysanthemums and flowering plants, would be easier handled if the Grapes were removed. It would also be better for the latter, providing a suitable storage or Grape room is available, as with the watering of the plants a certain amount of moisture is constantly settling upon the berries, and this eventually sets up a decay which, unless detected and removed, will soon ruin the bunches. Therefore, cut all actually ripe with a length of lateral attached and keep them in bottles in a cool, dry, and rather dark, airy room, where they will keep for a long time.

Renovating Vine and Peach borders under glass

Renovating or making new borders should be put in hand without delay, and the sooner the trees are planted the better, as the roots commence active operations at once. Borders for both Peaches and Vines should be at least 3 feet deep, thoroughly drained, and made up of the best possible loam, as they are to remain undisturbed for many years. In the case of Vines it is not advisable to make up the whole border in any one year, but give the young plants a width of about 4 feet the first season, adding another yard the following year, and so on.

Spring Cabbage

Another and final batch should now be put out, and when the plants are strong enough to hold up their heads, draw a little soil up around the stems, both of these and of former plantings.

Parsnips, Turnips, and Carrots

Lift and store the latter and a small quantity of each of the former, and thus avoid treading upon the land when the latter is in a sodden condition. The former keep better in the open ground, and the Turnips will continue to grow up till Christmas when left in the open. It is, therefore, unnecessary to store more than a few days' supply at any time.

Endive

Lift and plant all Endives still remaining in the open ground in cool frames, and blanch by placing a covering over the lights.

Celery and Leeks

These should be finally earthed up where not already done. Bring the ridge to a narrow point on heavy soils, so that water runs off freely. On light soils this is not so important.

Gathering fruit

This is now a daily task, and must shortly be completed, although it is far better to experience a little frost upon some of the very late varieties of Apples than to gather them before they part readily from the trees. Allen's Everlasting and Reine Marie Joseph D'Othee are cases in point.

Pears in store

Never do I remember a season when Pears have been of such rich and luscious flavour, some varieties which, during normal seasons, could only be termed second rate being absolutely delicious this year. The temperature in the Pear room should not be permitted to fall below 45 degrees.

Gladioli, Salvia patens, and the newer Montbretias

These should be lifted and stored in a cool, airy, frost-proof shed, where they may pass the winter safely. Before it is too late, examine all stocks of cuttings inserted during August and September, replacing any which, from various causes, have failed.

Plants in cold frames

Have covering material ready for use upon frames containing tender or half-hardy subjects, and get all such plants and others which have been standing in the open temporarily safely under cover, as sharp frosts may be expected at any time.

Tree and shrub planting

This may now go forward, but in order to reap the full benefit from these in future years the land they are to occupy should be deeply trenched, but not heavily manured.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Wall fruit trees

The fastening of these to the wall is a tedious and unpopular job during the cold weather, especially when the old-fashioned method of nailing is still in use. Where walls are properly wired, the work can be carried out in less than half the time and with the minimum of discomfort. When it can be managed, now is a good time to have this matter attended to, the weather being still comparatively mild.

The mulching of fruits

Trees and bushes in good bearing that show any sign of want of vigour will be greatly benefited by having a generous layer of well-rotted manure, or even of decomposed garden refuse spread all over the surface and very lightly forked in.

Orchard trees

These do not, as a rule, require much in the way of actual pruning, but it is a good plan to go over them carefully about this time and remove all dead wood, while anything in the way of overcrowding of the branches should be put right, cutting out whole branches where necessary, and otherwise regulating the trees, so as to preserve shape and balance. All wounds should be neatly trimmed with a sharp knife or chisel.

Ripening off Gloxinias

Gradually withhold water when the foliage turns brown and the stems part easily from the tubers, lay the pots on their sides in a moderately warm place, for if placed in a temperature much under 50 degrees they are liable to rot while, on the other hand, growth is forced during the winter if considerable
heat is given. Good results are had
rule, with a temperature of 50 degrees
degrees.

Young Gloxinias

Seedlings that may not have flowered

new gardens in Preston Park, Brighton

THOUGH many of the older residents n Brighton were rather dubious about he removal of the heavy iron railings 1 surrounded Preston Park and also moval of some of the old trees, I think all, if not all, now admit that the tions made a vast improvement. The al of some of the trees has made the out of a garden possible where flowers ow flourish. Of the garden itself, it a charming approach to the Park r. The new Pavilion is well placed, and not hide the picture of the distant land and the glimpse of the Downs in rther distance.

each side of the garden there are broad , with fine flower borders on each side of while in the centre there is a sunk In the early summer the flower rs were literally ablaze with bold masses tirrhinums and fine tuberous Begonias, the beds on the sunk lawn in the centre filled with the cooler-toned Violas. fine old vases of green coppery tone are duced with excellent effect, and there are ome stone statues, but these would look etter if placed on pedestals. The hinums stood the great drought tularly well, but their place has now taken by early-flowering Chrysanthe- s. Purple Verbena takes the place of of the purple Violas, and a centre bed e lawn is filled with a very fine group of e Lilies.

front of the new Pavilion, Chrysanthe- s have taken the place of Roses, and a a lake has been introduced. The path across it, with gaps through which the is seen, so a series of very formal ng stones is formed that are more us than beautiful. A large vase, draped Ivy-leaved Geraniums is placed in the te.

formal long borders which were so gay Antirrhinums in the summer, now con- scarlet Geraniums, intermixed with rin Marigolds, giving a fire-like effect. uberous Begonias were fine till the rains last week. This mixture of orange and rt occurs in other beds in the Old Steine ens. It certainly gives great splashes of which gladden the eyes of the many rs. The bright colour is carried right o the trees, for not only do festoons of ed electric lamps depend from them, he lamps are twined in and out the s of the trees with the most pleasing that has filled all who have seen them dmiration. ghton.

ich are the most interesting native American Irises?

t were only for the map, the article by . George Dillistone in GARDENING LUSTRATED for September 14th would be at value. A map is really the very best way otograph upon one's mind where a cer- lant is to be found growing in its native and, for more reasons than those of e and soil, it is important for good gar- s to know where their plants are indi- s. Perhaps rumours of the intense between the States of California and la may have reached the readers of GARDENING ILLUSTRATED, and, while I have no brief for Florida, or for Louisiana either, I cannot but be roused by the first lines of one paragraph where Mr. Dillistone says, "By far the most interesting Irises encountered would be those of the Californian sub-section." I feel that the new Irises described by Dr. John K. Small, of the New York Botanical Garden, in "Addisonia," for December, 1924, March, 1927, and March, 1929, are the most interesting, particularly those described in the last number. They are interesting for many reasons, two being that they are gorgeous and that they have been so long overlooked! How the thousands of plants of Iris fulva could have been collected and Iris vinicolor not have come to the notice of some plant specialist is a mystery, and, while some locations where these plants grow are in out of the way spots, they are not in unexplored ground at all.

Nearly all of these Irises are hardy in the vicinity of New York, and I think surely would do well in England, even in Lancashire (with some protection), and they are good garden subjects. By this I mean that they show up well in the garden picture, the flowers are large enough to attract attention if there are but a few of them, and in the mass they cause much comment. Mr. Dillistone must know about these Irises, as his Journey, on the map, marks the country they inhabit; but perhaps your readers might care to hear some details, and, as some of our Iris specialists here are propagating them, it is to be hoped that shortly they will be introduced to commerce and so made available for horticultural use.

The new sunk gardens at Preston Park, Brighton

Iris fulva, mentioned by Mr. Dillistone, does not seem to be so hardy, and we find that up here we have to grow it in dry ground to keep it over winter. We cover our Southern Irises with a thin application of salt hay, supported by branches from deciduous trees, and in the summer, if we have a dry period, we keep them well watered. Dr. Small noted that in their native habitat these Irises seem to die down and disappear during the summer and weeds and other flowers grow all over them. When the growing time comes round again they evidently send out side-shoots from the old rhizome from below, as the top appears to be rotted away. Iris tripetala has not kept over winter out of doors with us, and we now believe it is because the plant goes to a great depth, and when collected only the upper section of the plant was taken to send to us. When potted and kept in frames it has come along all right because the upper rhizomes and roots were not destroyed as they are by frost. No doubt if the top part dies away the growth comes again from the lower layer, and so we should be careful to have the whole plant before we risk it outside. Planting in the spring will not give enough time to make the necessary mass of roots and rhizomes before winter, so the plants might be potted up on arrival, kept in frames over the first winter, and set out without breaking the ball early in spring. One would naturally think that a native of South Carolina would be a surer subject for New York than those from the Mississippi delta, but the plants from the "other side of the ridge," as it were, seem to be hardier. Maybe it is because they always have had more severe weather changes to contend with.

Of the Florida species I. kimballiæ and I. savannarum are hardy with us, are handsome blues, far finer things than the well-known I. versicolor, but do not seem to be as sturdy and reliable as I. vinicolor, I. giganticærulea or I. violipurpurea. To the uninitiated, I. flexicaulis is not unlike I. foliosa, and has too prostrate a form of growth to be worth while in the garden, except for the collector or hybridist.

I. violipurpurea, related to I. vinicolor and I. atrocyanea, grows in full sunlight, "in prairie-like places on low grounds," and has a beautiful, spreading flower 5 inches in diameter, ruffled, and of a red-purple colour. This Iris attains a height of about 2½ feet, has good foliage, and is floriferous. Several flowers open one after the other on a stalk. This is true of practically all of these Irises.

There is a new species, as yet unnamed, of a pale ashen mauve with a cream reverse that is exquisite, and rather resembles I. violipurpurea in shape. This is a new colour in beardless Irises, and one that is sure to be in great demand, both in the garden and as a cut flower.

The brightest red-purple, with broad gold markings, is I. chrysophœnicia, probably a relation of I. vinicolor. This plant was discovered by Dr. Edgar Wherry and Dr. Small, growing in damp locations, and is the most richly coloured of all these new treasures.

I. chrysæola, collected by Charles A. Mosier and Dr. Small, grows at the extreme limit of the Mississippi delta. It enjoys damp ground at home and needs a full sun. A deep wine-red purple, with a gold flush, reflex, and markings, it is rather short of stature, being only 24 inches tall at the most. It is a more slender and less coarse plant than are I. miraculosa and I. albispiritis.

I. miraculosa will often grow 6 feet tall, has very pale mauve or white flowers, and was collected by Ruth and Arthur Svihla for Dr. Small. It is hardy with moderate protection in New York, but may prove a shy bloomer when too far north. It seems to thrive under various conditions as to habitat, except that rich soil is required. The flowers are very showy, having broad, wavy petals.

I. albispiritis is white, and a native of peninsular Florida. The spectacular effect of the flowers can be imagined when it is noted that the sepals or " falls " are 5 inches long and have a bright golden haft. If it could be combined in a South of England garden with the huge I. giganticærulea, a rich, bright blue, almost like some of the Kæmpferi hybrids we know so well, it would make a corner to remember. About 3 feet to 3½ feet tall, the blue is a clearer hue than is usual in wild American Irises. It likes dry situations, growing in turf in full sun, and having broad, handsome leaves of a bright yellow-green.

I. atrocyanea thrives equally well in the open and in partial shade. It is a rich, dark purple-blue, with curled and wavy parts that lie flat. It prefers damp situations, being probably quite hardy.

I. vinicolor has proved hardy with us, and is a flower perfectly described by the name. The stalks are slender and tall, and the whole effect is very graceful. It is so beautiful that the fortunate possessor, upon seeing it in bloom for the first time, is sure to rush off to call the gardening neighbours to see the new jewel. This Iris should satisfy the keenest member of either of the two great Iris Societies, and I foresee someone taking a C. M. with it at some not far distant show. Dr. Small and Dr. Wherry discovered I. vinicolor early one morning near New Orleans, growing in a sticky marl, but ordinary garden loam will be sufficient to produce perfect results, and the plant increases very rapidly, also it will grow in semi-shade or in full sun. The only protection given to it here over winter has been the leaves that drifted on to the bed from a nearby Maple. These fell between the plants, as the foliage of the Iris is heavy enough when it is dried off to make a considerable mat of its own. This mat should, of course, be left on until spring, when it can be pulled off and the bed tidied up. All these Irises are easily raised from seed, which is best sown directly it is ripe. That left on the plant or scattered upon the surface of the ground may not germinate for two years, as the outer casing becomes very hard.

Hon. Curator, Iris and Narcissus
Collections, N.Y. Botanical Garden.
New Rochelle, N.Y.

Grading of ware Potatoes

There is, as yet, no standard definition of a marketable sample of ware Potatoes. In view of the variations which occur in practice in regard to the proportion of diseased or damaged tubers, and of earth and other extraneous matter in commercial samples, it is desirable that a standard definition should be provided in the interests of producers, distributors, and consumers.

The Minister of Agriculture and Fisheries has, therefore, made draft regulations* under the Agricultural Produce (Grading and Marking) Act, 1928, prescribing and defining grade designations for voluntary use in the trade. These have been demonstrated by the Ministry of Agriculture during the past year at a number of agricultural shows up and down the country. They provide for variations in the size, *i.e.*, minimum diameter of the tubers as between one grade and another, but for a common standard of dressing as regards disease, damage, dirt, and so forth.

Owing partly to differences in public taste and partly to the difficulty in defining cooking quality, no provision is being made at the moment for the use of the National Mark on graded consignments. It is believed, however, that even without the National Mark the existence of a statutory standard of dressing will be as beneficial to the Potato industry of this country as it has proved to
be elsewhere and that, in time, s
standard will work its way into the t
its merits.

At present, good and bad sampl
marketed under the same descriptio
using the statutory grade desig
growers will be able to guarante
standard of dressing which should g
way towards securing them from th
petition of poorly-dressed lots. Mer
both wholesale and retail, and pu
private institutions accustomed to
large supplies should find the grade
ful.

The extensive use of these grades
junction with the excellent quality
year's crop should help to stimulate
mand for home-grown Potatoes, and
be an obvious and proper departure fr
present condition of informality an
certainty.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish pla
be named should send fair examples of eac
stem, leaf, flower, or fruit. (Snippets of
and points of shoots are useless.) Not mor
four plants should be sent in any one week
same correspondent. Where more than on
is sent they should be numbered. Of conife
cones should always be sent.*

Naming fruit—*Several specimens in di
stages of colour and sise of the same kind g
assist in its determination. Single, unri
deformed specimens are difficult to name
do not undertake to name more than
varieties at one time.*

FRUIT

Apple stock

(J. Wilson).—It is impossible for us to name your specimen, beyond the fact that it is an Apple stock. We see no reason why the trees should not be " worked," *i.e.*, grafted or budded with known varieties of Apples if you so desire. On the other hand, it is best to use existing known varieties of Apple stocks for the purpose, because the performance of Apples worked on such stocks are better known. An Apple worked on Malling No. I stock will produce a very vigourous tree; if Malling No. II stock is used, the tree is less vigorous, etc., etc. We hope to publish an article on Apple Stock in the near future.

Currant Mite

(R. M. Warden).—The control for Big Bud Mite of Black Currant is to spray the affected bushes with Lime Sulphur at the strength of 1 in 12 in spring when the foliage is the size of a shilling. This treatment causes considerable scorching of the leaves, but the bushes soon recover from the effects of the spray, and it appears that the treatment does not affect the cropping power of the bush.

Diseased Pear

(R. C. T. Battle).—Your Pear is affected with Pear Scab, a fungus which attacks the leaves, fruit, and young wood of the Pear. The best method of control is to spray the tree with Bordeaux Mixture when the flower buds are just showing colour, but before the petals open. A second spray should be given when most of the petals have dropped from the flowers, and a third three weeks later. The spray fluid should be driven well to the undersides of the Pear foliage.

(Stow).—The specimen Pear leaves are affected with Pear Leaf Cluster Cup. This fungus lives at different periods of the year in two entirely different hosts. In May dirty-orange, soft, gelatinous bodies about ½ inch
long may be found on the swollen br
of several kinds of Juniper. The gela
bodies form minute spores, which are
about by the wind. If any of these
alight on the foliage of Pear or Ha
they germinate and produce growths
resemble clusters of little horns with f
tips. The curious clusters spring
orange-coloured spots on the leaf. You
endeavour to trace the source of the a
Juniper, because the disease is peren
this host, and is only annual in the Pear
removal of one of the hosts appears
the only control.

Peach trouble

VEGETABLES

rgon?

.C.).—The specimen sent is Artemisia culoides, and is not the true Tarragon, gh it is frequently sold as such. This has longer and narrower leaves, and is o the taste, not aromatic like the true on, which is A. dracunculus.

er failure

lin).—Your Celery, in common with eople's crops, has been badly attacked Celery Leaf Mining Maggot. We think it is now too late to do anything to control the pest. After the crop has been lifted, the site should be dressed with a good soil insecticide at the rate advised by the makers. Make a note of the time at which you first noted the appearance of the trouble, and another season give the plants an occasional spraying with a nicotine wash, commencing about three weeks earlier than the date noted. A light dressing of an equal mixture of old soot and lime applied when the foliage is damp assists in warding off attack. The mixture should be applied at intervals throughout the season.

Diseased Carrots

(F. P., Devon).—The cause of the failure of your Carrots is that they have split and soil organisms have got in through the injured surface and caused an internal rot. Many things will cause Carrots to split. Sowing the seed too early in the season is a frequent cause of trouble. Allowing Shorthorn Carrots to remain in the soil too long is another factor producing split roots. A too generous supply of nitrogenous matter will produce the same result. It appears to us likely that the latter is in your case the cause of your failure. From your letter we think you have certainly erred on the side of being too generous. Next year try another crop giving only a dressing of 1 part sulphate of potash and 3 parts superphosphate at the rate of 3 ozs. per square yard. Do not be in too great a hurry to sow the crop. If you want early Carrots sow a few early, but leave the maincrop sowing until May.

TREES AND SHRUBS

Cydonia fruits

Kindly inform me whether the fruits of all varieties of Cydonia japonica and Pyrus malus are edible. If so, my intention would be to mix them with English Quince in the making of table jelly. D.

[The fruits of all the species of both Quinces (Cydonia) and Pyrus are edible when cooked, but excessively harsh and astringent in their raw state. They are used for making jellies and other conserves, also for flavouring ices, etc.]

Cutting back an old bush of Caragana

(E. Northcott).—You may safely prune your Caragana at any time after the leaves have fallen, but we advise you not to be too drastic in your methods. Your plant would most probably thicken at the base more readily if you shorten down the top growth and reduce the sides reasonably.

Flowering shrubs for forcing

(C.).—See note on flowering shrubs in pots, page 730.

ROSE GARDEN

Rose caterpillar

(F. M. W.).—The insect you send is the caterpillar of the Swallow Tailed Moth. The caterpillar is not uncommon among Roses, but it does not occur in sufficient numbers to be regarded as a serious pest. Hand picking is usually sufficient to control the caterpillar. In common with the caterpillars of several other species, the creatures are called Stick Caterpillars.

FLOWER GARDEN

Iris disease

(R. F. S.).—Yes, the disease is Soft Rot. If the varieties are worth trying to save we think you could manage it by making still another attempt. Take up the affected rhizomes and scrape away all the affected portions, taking care to preserve the healthy roots, and then thoroughly rinse the scraped rhizome in 2 per cent. formalin solution. Plant again in a clean bit of soil, previously dressed with superphosphate of lime at the rate of 3 ozs. per square yard. When growth begins to be active in spring, give a soaking with Cheshunt Compound. You will, of course, realise that the treatment of lifting the Iris at this time of the year is only an effort to save plants which otherwise seem doomed to go under to Soft Rot. In the usual course of events a good time to lift and replant Iris is in July when all the blooms are over and just before they start to make new roots. From the appearance of the specimens sent, they are making a good stand against the disease, and, with a little further assistance, should pull through. We should not use Cheshunt Compound now. The superphosphate you have given should help.

Helianthemums (Sun Roses)

(Queenie).—Your letter is not quite clear as to the family you refer to. The Cistus are Rock Roses, and Helianthemums Sun Roses, so we presume you refer to the latter, which are mostly dwarf plants. These may be cut back to within a few inches of their base with perfect safety at the present time, although the best time is immediately after they have finished blooming, when they quickly break into fresh growth and form nice compact plants before late autumn. This should be done every second year if compact plants are desirable. You need not be afraid to cut back those you refer to as having a portion of bare stem, and you may lift and replant if desirable a month later.

Tropæolum speciosum in winter

I should be glad of your advice regarding the care of Tropæolum speciosum during the winter months. After several disappointments I have at last succeeded in getting two plants to grow up my house. They are on a north wall and doing well, but as I find this plant succeeds best in damp, mild climates, such as Wales or West of Scotland, I am afraid it may suffer from the frost in this colder part of the world (Oxfordshire, 500 feet above sea level). Is there any way I can protect it, and how should it be treated? I am exceedingly anxious to get it to climb up the house. A. B. H.

[You should experience no difficulty in keeping this beautiful climber through the winter, especially in your distict. Although protection is scarcely necessary, you might (to make doubly sure) spread a layer of half decayed leaves and a little sand over the roots, or even a little straw. Tropæolum speciosum revels in cool, shady situations where the soil consists of two parts sandy loam and two parts decayed leaf soil, peat, and sand. This should be at least 2 feet in depth, and if strings, or even Pea boughs, are placed in position for it to cling to it will run up on its own account and grow more rapidly. The foot of Yew hedges form excellent positions for its roots, and when so planted it will garland a hedge 10 feet in height in a few years.]

Plants for crazy paving and wall

(Nook).—(1) Failing a birds' bath, or old well head, we would not have anything in the centre. But if you prefer to plant, then we recommend a small group of Yucca filamentosa or Lilium giganteum. (2) For the crazy paving the following plants are recommended: — Campanula pusilla, C. garganica, C. pulloides, C. fenestrellata, Arenaria balearica, A. montana, Anemone apennina, Snowdrops, Milla uniflora, Oxalis tropæoliodes, O. corniculata, Mimulus radicans, Calceolaria John Innes, Mazus pumilio, Thymus serphyllum coccineum, Gypsophila Dubia, G. Fratensis, Ourisia coccinea. Aubrietias in variety, Corydalis cheilanthifolia, Antennaria tomentosa, Gentiana acaulis, G. Farreri, Cotula squallida, Raoulia australis, Helipterum anthemioides, Saxifraga sancta, S. apiculata, S. aizoon, Mossy Saxifrages, Veronica pectinata, Sedum sexangulare, S. spathulifolium, S. dasyphyllum, S. kamtschaticum, Æthionema pulchellum, Æ. coridifolium, Erinus alpinus, Dianthus in variety, Coronilla iberica, Helichryssum bellidioides, Hypericum reptans, H. fragilis, Linaria pallida, L. aquitroloba, Alpine Phlox in variety, Tunica Saxifraga, Primulas of the Juliæ type, Auriculas, Cytisus Ardoinei, Pratia angulosa, Lysimachia Henryi, Nierembergia rivularis, Oxalis magellanica, Viola Lady Crisp, V. J. B. Taylor, V. Bosniaca, Mentha Requieni, Cornus canadensis, Pentstemon cristata, Asperula Gussoni, Cotyledon simplicifolia. (3) The Raoulia would thrive on the wall, also Aubrietias, Erinus alpinus (scatter the seed of this in the crevices), Dianthus, Zauschneria californica, Z. Mexicana, Campanula abietina, C. muralis, C. rotundifolia, Onosma taurica, Acantholimon glumaceum, A. venustum, Androsace Chumbyi and A. lanuginosa, Erigeron mucronatum. (4) Plant for wall. Pyracantha coccinea Lalandii, P. angustifolia, orange yellow berries, Cydonia cathayensis, C. japonica rubra grandiflora, Vitis Coignetiæ, and Cotoneaster Henryi.

Dahlia Radium

(A. S.).—This wonderful small-flowered Pæony Dahlia, I believe, was raised by Mr. J. T. West, Brentwood, and this well-known raiser has given us many first-class seedlings. The variety, however, may be obtained of any of the leading Dahlia specialists. Since the previous note this Dahlia has been even better than then described.

Salvia uliginosa

I am much interested by your advice in respect of Salvia uliginosa as I am growing it for the first time and think it exceptionally beautiful. But my plant grew to 5 feet before the blossoms opened, and is only now in its full beauty. It is manifestly impossible to pot it up as it stands. I thought of cutting it down a little later to about 12 inches to 18 inches. Will it bear this? And can I take cuttings from it now, or from the shoots that have flowered as soon as the flowers go over? All shoots seem to be bearing flower spikes, but some will not have time to bloom before winter. T.

Oxford.

[Before you cut your plant down, remove a few of the flowerless shoots—with a little of the old stem attached—from the axils of the leaves, and dibble these into sandy soil. The cuttings must be kept in a cool closed frame, and protected from frosts. You may also put in portions of the older stems with a growth or two attached in the same way, as these will also root if cut below a joint. The old plant may then be cut down to the height you suggest, lifted with a nice ball of earth, and potted up. This should be placed in a greenhouse or frame where a temperature of 40 degs. to 45 degs. is maintained, and kept slightly on the dry side. About February it should be given a slightly warmer place, when cuttings will develop freely.]

GREENHOUSE

Cineraria insects

I shall be much obliged if you will identify for me these nasty little fawn-coloured grubs, which, I think, must be responsible for great damage to my Cinerarias—leaves badly bitten. It has been going on for weeks, and I blamed sparrows, mice, earwigs, woodlice, and tried everything under the sun to stop it. Now to-day, when looking them over for about the tenth time, behold these little wretches. They were very active when done up, but may, of course, die of asphyxiation before the box is opened. Seen under a magnifying glass they are segmented with legs, like miniature caterpillars. Is there any cure beyond hand-picking?

(Mrs.) A. T. Tulloch.

[The specimens sent are the larvæ of one of the Hover Flies, and they are amongst the gardener's best friends. The creatures feed upon Aphis, and their presence on your plants is a sure indication that the plants within the last few weeks have been infested with Aphis. Mrs. Hover Fly never makes a mistake and lays eggs on a plant free from Aphis. You will have to make a further effort to find the culprits which bite the foliage. Try searching the plants with a light at night. The glossy appearance of the leaves is probably due to the Aphis attack, and there is no connection between this and the eaten foliage.]

MISCELLANEOUS

Soil for examination

(L. G. B.).—We have examined the soil sample, and should think that in its natural state it would grow certain shrubs well. The soil is very acid, and you would be limited to the plants which delight in such soil, such as Rhododendrons, Ericas, Azaleas, Kalmias, Pieris, Pernettyas, etc., etc. If the soil is not deep enough for the purpose, pockets could be dug out here and there and the above shrubs planted, using the Ericas in the more shallow portions. If it is desired to plant shrubs other than the peat loving kinds, chalk must be added. The soil appears to us to be rich in organic matter, and only needs lime to make it fertile. The cheapest way of treating such soil is to grow the plants suited to the type.

Names and addresses of French gardening papers

(F. B., Portadown).—(1) "Revue Horticole," Parait le 16 de chaque mois, 26 Rue Jacob, Paris; (2) "Le Petit Jardin," Parait le 10 et le 25 de chaque mois, 26 Rue Jacob, Paris.

The small tortoise (Testudo græca)

(L. F. J.).—The small tortoise hibernates during the winter and requires no food. A cosy box with a little sweet hay in it will be found quite suitable, or a garden frame which is fairly dry and contains a little litter. Some people leave them in the open to make their own winter arrangements, but the above suggestion will be found more satisfactory.

Spent Hops

(R. M. Warden).—Spent Hops make an excellent manure if they are mixed with an equal mixture of good grate shoddy. The two should be thoroughly mixed together and put into a compost heap for six months. The heap should be turned once or twice during the period. You then use the manure as you would farmyard manure.

Weed in pond

(W. Barbour)—The slimy scum is known as Flannel Weed which, owing to the very dry weather, has been unusually troublesome this year. This can be destroyed with copper sulphate. You must first calculate the cubic contents of your pond by multiplying together the length, breadth, and average depth in feet. Then multiply the result by six, which will give approximately the number of gallons of water in the pond. For each 10,000 gallons put 2½ ozs. of copper sulphate into a bag and pull it through the water until all is dissolve should not injure Water Lilies, nor aff fish but trout. A second application necessary in a fortnight. Is it poss increase the circulation by enlarging in outlets, as if this could be done it wo prove matters? The tadpoles a responsible.

Parasite of White Fly

Will you kindly give me any infor respecting a sure preventative for Wh in a greenhouse? I hear the Resear partment of the Ministry of Agricultu found something that is a sure cl from the pest, an insect or parasite th on it, so gets rid of it. I would be know if it is procurable or only for m men and the trade. E. Codrinc

[There is a very effective Chalcid p of the greenhouse White Fly which in the name of Encarsia formosa parasite, together with full instructi to the best way to establish it amon host, have been sent out from the Ch Research Station. Whether or no t tribution is confined to commercial g is a point about which we are not Write to The Director, Cheshunt Re Station, Cheshunt, Herts, and ask f ticulars of the distribution. It is n late in the season to introduce the p unless the greenhouse concerned is which the White Fly breeds all th round.]

ROSES, FRUIT TREES and PERENNIAL PLANTS

OUR MOTTO: "BEST QUALITY AND LARGE TREES"

FREE.—With every order of **10s.** we are giving away 25 "Cheiranthus Allioni"—the Siberian Wallflower which will give you a lovely show of **BLOOM** outdoors all the Winter. **£1** orders or over double quantity.

BUSH ROSES, extra large Trees in Tip Top Varieties, 6 for 4/6, 12 for 8/-, as follows: **Shot Silk, Queen Alexandra, Golden Emblem, Betty Uprichard, Golden Gleam, Ivy May, Sensation, Druschki, Crimson Glory, Ophelia, America, Rev. Page Roberts,** and hundreds of other varieties.

STANDARD ROSES of all the above, and a large quantity of other varieties, extra Good Heads, only 2/6 each.

CLIMBING ROSES, these are very special, about 6 ft. to 8 ft. high, 6 for 4/-, as follows: **Paul's Scarlet Climbers, Gloire de Dijon, Cli. Ophelia, Lemon Pillar, Cli. Daily Mail, Alberic Barbier,** and most other varietias.

WEEPING STANDARD UMBRELLA ROSES of all above, and others, only 3/- each.

FRUIT TREES. We guarantee all our Fruit Trees to be grafted on the finest stocks possible, and that all are free from Canker or Disease, all 5 and 6 years old Trees. **Bush** 2/- each, **Standards,** 8 ft. high, 3/- each, **Cordons,** 2/6 each. **Trained Trees for Walls or Paths,** 3/6 each, as follows:

APPLES, Worcester Pearmain, Lord Derby, Cox's Orange, Bramley's, Beauty of Kent, Blenheim Orange, etc

PEARS—Williams' Bon Chretien, Jargonelle, Fertility, Marie Louise, etc.

PLUMS—Victoria, Czar, Golden Drop, Monarch, etc.

CHERRIES—Napoleon, Black or White Hearts, Morello, etc.

DAMSONS—Meryweather or King of Damsons, etc.

BLACK, RED or WHITE CURRANTS or GOOSEBERRIES, fruiting trees, 6 for 3/-

LOGANBERRIES or AMERICAN BLACKBERRIES, 1/3 each.

EVERGREEN OVAL LEAF PRIVET for Hedging, 3 ft. high, 3/- doz., £1 100.

DOUBLE LILACS, in all colours, fine trees, only 1/3 each.

RHODODENDRONS, full of bud for blooming, 2/6 each.

PERENNIAL PLANTS. These should be planted now to obtain the finest results for next season, as they are very hardy and will stand all frost and bad weather; all are guaranteed to be good transplanted stuff. We advise you to take advantage of this Special Offer—all, as under, are 6 for 1/- only: **Perennial Gaillardia, Coreopsis, Canterbury Bells, Double White Pinks, Double Hollyhocks, Sweet Williams, Violas, Pansies, Lupins, Double Carnations, Oriental Poppies, Iceland Poppies, Scabiosa, Double Geums** (yellow or red), **Polyanthus, Perennial Asters, Red Hot Pokers, Pyrethrum, Violets, Golden Rod, etc.**

WALLFLOWERS Dark Red or Golden Yellow, 25 for 1/-.

The Planting of Lilies

RING the summer months, the keen rdener makes many notes; notes ich, alas, for the want of a reminder, n overlooked at planting time. Some no doubt, made notes of Lilies they flower, which they intended to plant e time came round. May we remind The time has arrived Plant now! cultivating any plant that we know out, it is advisable to ascertain the from whence it comes, and as far as imitate the conditions; his is impossible the matter of at it is surprising ith a little how much done. For , many of the ian Lilies are along the f streams, but been observed ere, under conditions, lbs do not in mud, but nd above the vel, on raised ks, the roots, , going down moisture. An method to ith these par- ar Lilies is to e bulbs on up- flowerpots, the bulb and a compost of sandy loam, with leaf- d and a little The roots will d their way sides of the own to the , leaving the ly dry. Those ave streams, akes, or brooks, can make a delight- ting on the banks, about 1 foot above er level, where, if sandy loam and uld is incorporated with the existing gorgeous display of wonderful blooms ad annually.

ost important point in the cultivation , and one which applies to the whole is drainage. If, when preparing the site, similar care and attention were this as to position and compost, it is there would be fewer disappoint- Unless the existing drainage is very sharp, soil should be taken out at least 2 feet and 2 inches to 4 inches of crocks, ashes, or small stones placed at the bottom, a layer of sand and charcoal chippings and then filled in with the compost made up for the species or variety it is intended to replant.

Another important point is depth. Shallow planting should be avoided With the exception of L. candidum, L. excelsum, L. chalcedonicum, and L. giganteum, and, on heavy soils, L. Martagon, and possibly a few other base rooting kinds, they should all be well covered. Even small stem-rooting kinds like L. tenuifolium and the variety L. Golden Gleam should be planted 5 inches to 6 inches deep, while those of a strong growing nature should be planted 8 inches to 9 inches, and certain kinds, such as L. Henryi, L. centifolium, and L. Sargentiæ 10 inches to 12 inches is not too much. It is a fallacy to adopt the principle of planting twice the depth of the bulb. This may be quite sound advice in the case of Tulips and Narcissus, and would apply successfully to certain Lilies, but it would spell disaster in the case of L. giganteum, which produces the largest bulb of the genus, yet requires to be planted more shallow than any other species. In heavy soils, an inch or so less is advisable, but it is better to lighten the soil with leaf-mould and sand and plant the proper depth whenever possible.

Lilium tigrinum splendens in a Rhododendron bed at Kew

The large orange-coloured flowers, spotted black, are freely borne on 5-foot stems well above the Rhododendron foliage. The Lilies are seen to advantage against the Cedar tree in the background

From a photograph taken in September

With regard to compost, many popular kinds, such as L. chalcedonicum, L. excelsum, L. croceum, L. Szovitzianum, L. Hansoni, L. pyrenaicum, and L. Martagon do well in sandy loam without the addition of leaf mould, and although some experts condemn the use of all forms of manure, the above species produce extra fine bulbs when well rotted farmyard manure has been incorporated. It should, however, be made quite clear that on no account should bulbs be allowed to come into direct contact with it. Beds and borders enriched with manure the season previous usually provide a good medium if drainage is sharp. A good compost for the general collection is two parts loam, one part leaf-mould, and one part sand, and with this we always like to add a little charcoal. This mixture, however, the enthusiast will vary with closer knowledge of individual requirements of certain species; for instance, we do not think a better compost than equal parts loam and sand will be found for L. japonicum (Krameri), with a surface covering of rotted leaves, with the sharpest possible drainage. Special mention is made of this particular species, as many inquiries are being made as to the best method of growing it. Whether it is intended to plant in the open or for greenhouse, imported bulbs should be potted and plunged in a bed of ashes made up in a cool frame, transplanting in the spring in a cool, partially shaded situation, with the sharpest possible drainage. Most of the Elegans section delight among shrubs, in a light sandy soil and sunny position. L. Batemanniæ is also very successful under similar conditions.

Concerning Lilies of more recent introduction, L. Wardii, the beautiful fragrant pink Martagon, which is likely to prove a fine addition to the popular varieties for the garden, is quite at home in sandy loam and leaf soil, with humus in the form of old leaves during the winter and early spring. At Nymans, in the wonderful gardens of Lt.-Colonel Messel, Mr. Comber, who is apparently as much at home with Lilies as rare shrubs, is growing it to perfection, while L. Duchartrei var. Farreri during the summer is a wonderful sight of graceful nodding heads. The stems of both these Lilies travel under the ground for some distance and form a number of small bulbs.

Towards the end of the year, large importations of L. auratum will be available, and early in the new year the wonderful L. sulphureum and the dainty L. Lowei will arrive. The finest L. auratum we have seen were grown in rich loam, with rotted leaves used as a mulch. Providing the sharpest possible drainage is given, better results are obtained from a good loamy soil than peat mixture. Plant this Lily 9 inches to 12 inches deep, and look to its drainage. It will repay to do so.

In various parts of Sussex are fine specimens of L. sulphureum, one in particular at Gravetye Manor which withstood the severe winter receiving only the protection of old leaves. This species does well in a compost of equal parts rich loam and leaf mould, with plenty of rotted leaves as a subsoil on 2 inches or 3 inches of drainage material.

One other important point, which should not occasion any difficulty. Envelope all Lily bulbs in sharp sand to the extent of $\frac{1}{2}$ inch to 1 inch thick, this will help considerably in keeping them clean and healthy.

Nodding heads of Lilium Duchartrei Farreri

Lilium Henryi, 8 feet high

Lilium Philippinense formosanum

I have been very interested in recent articles on Lilies, and especially the notes on L. Philippinense formosanum.

I grow a good many in my garden, near Christchurch, New Zealand, raising them from seed, sown the day they ripened. Many of the seedlings flowered outside in ten months, the frosts preventing the later ones from maturing. Three-year-old bulbs send up heads of bloom, bearing up to eight on a stem. As the seed is so late outside, I lift a few bulbs, pot them, and let the seed pods finish ripening in a vinery—or nearly ripen—cut the stems, and hang them upside down on a sunny verandah till the pods begin to split, and then sow them. I raised as many as 300 seedlings from one pod.

MARY POULTON.

86, *North Parade, Shirley,*
Christchurch, New Zealand.

Raising Pinks

No garden is complete without its Roses, and certainly no border is complete without its Pinks. When bedecked with their old-fashioned, sweet-smelling blossoms, Pinks possess an indefinable charm, and are among the best appreciated flowers of the garden. Happily, they are not difficult to grow, providing the soil is well drained. If it is of a heavy nature it can be rendered suitable for the Pinks by the addition of coarse sand and old mortar rubble, the latter substance being most beneficial to the plants. To ke
in good condition it is necessary
young plants every other year to rep
old ones, or else the old plants must

subjects.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Chrysanthemum uliginosum

he report of the conference on garden pl nning, published in the " Journal " of t Royal Horticultural Society (Vol. V part 2, September, 1929), there is a r paper by Miss Gertrude Jekyll on our in Garden Planning," in which a ence is made to the planting of Michael- Daisies. Miss Jekyll advocates planting y themselves, but recommends associa- g with the purples that fine old plant, anthemum uliginosum, still frequently le Pyrethrum uliginosum, instead of Michaelmas Daisies. Her words are :— re are now many fine kinds of the sh shades, and also some good whites, the best enjoyment of the Michaelmas is garden, the cool colouring of the ps is to be preferred; and for white, rum uliginosum, with its large, pure blooms, is more effective than the white a of the Aster varieties."

Th old plant, introduced from Hungary 6, has rather fallen in favour, but it always to be kept in mind, not only for ction with the purple Asters, but for its merit as a border flower. It has the ad- tge of late bloom, coming in generally in tnber, and lasting until severe frost. It be adapted for the back of the border, as is f good height. A recognised book of ence gives its height as 1½ feet, but s is quite erroneous. The six feet, ally given, is more correct, but, of r, it varies in stature according to the u of the soil, combined with the moisture h season. To grow C. uliginosum well it u have a good loam, not too dry. Should sil be dry the plant is very liable to lose er leaves, and this is a disfigurement les the lower portion of the stems is d by other plants. This plant is in- sd by division or seeds.

Large Tomatoes

n our issue of October 26th, under the g "Large Tomatoes," " East Sussex " rous to learn of recorded weights of oes, so I send the enclosed notes along.

"A monster Tomato from the gardens of m. Bullivant, Homewood, has been ted to us this week, and for shape and it is a perfect specimen. It weighs 1¾ lbs., and is not a solitary example wth, as the Homewood gardens have roducing these mammoth fruits all the r. The variety is Sutton's Perfection. recent Crystal Palace Show, Mr. ell (Mr. Bullivant's gardener) took for a dish of fruit (nine) which d 7 lbs. 9 ozs."

above from the " Beckenham l."

ne Tomatoes.—I am sending you a ntaining some clusters of Tomatoes tion), and I shall be glad of your of the same. I gave a note of the as carried out here when sending you ndividual specimens (*vide* page 294, r 2nd, 1890), and there it will be seen that the root space for our plants is very limited.

" I think the clusters now sent, and of which we could gather many, show the value of artificially assisting fertilisation.

" Thos. Crosswell."

" Homewood, Eden Park, Beckenham."

" The cluster referred to by our correspondent was very fine, eight highly-coloured fruits of perfect form, weighing 4 lbs. 4 ozs. On the previous occasion referred to, Mr. Crosswell sent us some of the finest Tomatoes we have ever seen, the largest fruit in that case weighing 19 ozs."

The above is from the "Journal of Horticulture," and when the late Mr. John Wright was its editor.

Thos. Crosswell.

Chislehurst.

Double Tropæolum

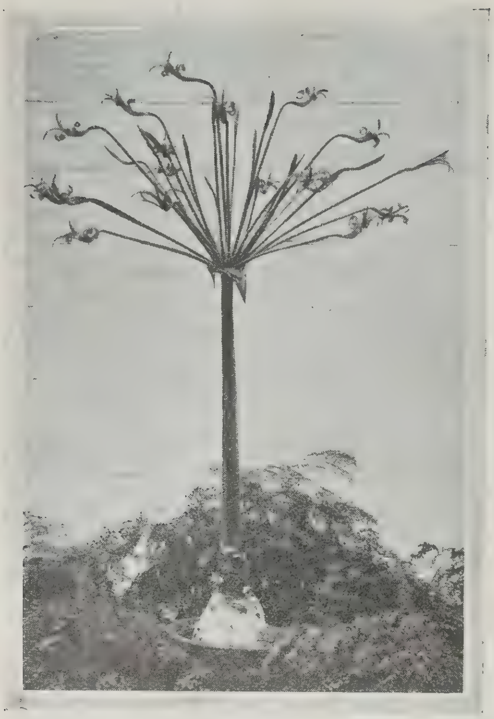
PHOTOGRAPHY is notoriously unflattering to flowers of brilliant scarlet colouring, so that the bank of Tropæolum shown does no justice to the actual effect, which is a mass of strongest scarlet only partly broken by the foliage. No drought such as the disastrous dryness of the recent summer deters it, and its place in a poor soil in full sun only shows it off the better. The flower being fully double has quite lost its original shape, and instead of having five distinct petals is transformed into a flat round rosette with something like forty Daisy-like petals in three or four uneven rows, lying flat on one another. The usual long spur at the back is quite lost, though the five yellow sepals remain. Besides this scarlet form there is one of strong yellow colouring. These double Tropæolums are not hardy, but are easily propagated by cuttings; the cuttings grow so fast during the winter in a greenhouse that if not stopped they would be very lanky things when the time came for putting them out. It is, therefore, well to take off the points once or twice and grow them afresh as more cuttings. G. J.

Double scarlet Tropæolum

The Death's-head Moth

" A Scottish Gardener's " note (page 720) on this splendid insect is very interesting. An immense increase has taken place during recent years in the extent of land in Scotland devoted to Potato culture, and, whereas the chief food of the Death's-head Caterpillar in this country is the foliage of the Potato, a corresponding increase in the moths might have been expected. And that probably would have taken place, but for the fact that the caterpillar, when full grown, buries itself in the soil at a depth of 8 inches or 9 inches, where, by means of a gummy secretion, it forms a comfortable cell, wherein to pass its

Campanula lactiflora with Ferns



Brunsvigia Josephinæ from the Cape of Good Hope

stage as a chrysalis; but comparatively few of the chrysalids escape destruction while the Potato crop is lifted and the ground is being prepared for a fresh crop.

In all stages of existence after leaving the egg, this creature has the singular faculty of uttering audible objection to being handled; the caterpillar barks, the chrysalis squeaks, and the perfect insect chirps. If "A Scottish Gardener" wishes to win the affection of his captives, let him supply them with honey, of which they are passionately fond.

Monreith. HERBERT MAXWELL.

School of Horticulture in Northern Ireland

In your issue of the 19th ult., I note you state you do not know the address of a school of horticulture in Northern Ireland.

Might I be allowed to draw your attention to the existence of the Agricultural and Horticultural College, Muckamore, where complete courses of instruction are given?

If your correspondent will apply to the Principal of the College, Mr. R. J. Fannin, A.R.C.Sc.I., N.D.A., full particulars will be supplied of all courses of instruction at the college.

ALEX. TURNER,
Late Horticultural Instructor at the College.

Gypsophila paniculata

I SEND a snapshot of Gypsophila paniculata; it is 7 feet 6 inches each way. It was a very fine specimen.

F. T. STEPTOE.
Badbury, St. Leonards Road,
Weymouth, Dorset.

Chrysanthemum September White

I have grown this variety for three seasons and have experienced the following:—The first time I grew it here the blooms were pure white, while last year the blooms on a few plants were streaked with rosy-lilac. I took cuttings from the plants where blooms were true to colour. This year I have not had a pure white among all my plants, all the blooms being shaded rosy-lilac. I have mentioned this to others. Some say the sun causes this. The sun may have something to do with it, but I still find the streaks when there is lack of sun, although not so precise. If the sun causes it, why is it that Framfield White and White Countess on the same ground and with same treatment are still pure white? A few in the district, which is near Carlisle, experience the same with this variety. Was this variety a sport from the old Marie Masse? I would be glad if any correspondent could enlighten me on this, as it might be reverting back to the old parent. My blooms were splendid of the variety, as I disbudded well, but I would have been let down if I had depended on it as a pure white. I would be pleased to have other gardeners' experience with this variety to see if it is susceptible to this changing colour. It is really a splendid variety where the blooms are white. A friend of mine a few miles away says in his garden it is true to colour, and has offered me cuttings from his stock, so will give them a trial another season. This has been a splendid year for outdoor Chrysanthemums, which are still blooming.

A CUMBERLAND GARDENER.

Brunsvigia Josephinæ

I THOUGHT perhaps the enclosed photograph might be worth reproduction in your paper and interest many readers. After failing to flower for several years this remarkable bulbous plant flowered here for the first time in September.

J. RUTHERFORD,
Bailiff to Miss Durning Lawrence.
The Farm, King's Ride, Ascot, Berks.

Cyananthus lobatus

The correspondence on the colour of Cyananthus lobatus is an example of the difficulty of carrying the exact shades of colour of any flower in one's mind. Your correspondents are evidently writing from memory, for with both Gentian and Cyananthus flowers before me as I write, I can definitely say that the colour of C. lobatus is rich violet, and certainly not Gentian blue, neither does it fade to white, for the colour is maintained throughout the flower.

Mr. Arnold's note appears to suggest that C. lobatus and C. incanus are the only species of Cyananthus in cultivation, but there are at least six, and if Captain Kingdon Ward's giant form K.W. 5949 is given separate specific rank from C. lobatus, there are seven.

This fine Cyananthus, which was
by Captain Kingdon Ward during
1925 expedition, is larger in all its pa
C. lobatus, its habit of growth is more
ing, and the beautiful flowers, w
rightly describes as violet, are 1½
across.

C. petiolatus K.W. 6082, is
beautiful species collected at th
time. Its foliage is so densely cove
silvery hairs that the plant may be d
as a fragile beauty, clothed in gr
adorned with amethyst stars. A
Captain Kingdon Ward found the
growing on wet granite cliffs, it res
damp winters rather more than th
species, and I am afraid that it will
cult to keep long in cultivation.

C. Farreri is perhaps the best
in cultivation, for, instead of the
ing habit which is so character
C. lobatus, its slender growths form
mat of almost Fern-like daintiness,
with flowers fully equal to C. lobatu
and richness of colour. It is strange
Farreri is so little known in garden
succeeds under the same treatmen
lobatus, and we find at Bodnant th
the two are planted together, C.
will overrun the older species. C.
has several forms, of which the dai
Viocalyx is the most prized. Cooper
is another desirable one, with flowe
distinct shade of violet blue.

The trailing growths of C.
form a fairly compact mat o
green foliage, with silvery hairs. The
do not compare in size with some
others, but it a desirable species, an
raised from seeds.

We are growing one other specie
the name of C. inflatus; it is of
growth, but as it has not yet fl
I cannot describe it.

The Cyananthus are worthy of muc
cultivation, for they are first-class
flowering during August and Septemb
the majority of the European Alpi
over.

A moderately sunny and well-draine
on a position in the moraine, will su
best, and when once established, all t
for is a piece of glass over them dur
resting season to shield them from our
rains. F. C. Pu

Bodnant Gardens, Tal-y-Cafn,
North Wales.

Gypsophila paniculata, 7 feet 6 inches each way

Lilium canadense

is delightful Lily is usually satisfactory woodland soil where lime is absent or gible in quantity. Grouped with low-oing shrubs or suitable plants, a few will provide a very pretty effect during ner. The bulbs are somewhat rhizom-, the new bulb being produced at nd of a stolon characterised by delicate scales. The bulbs should be planted in nn rather deeply, say, 8 inches to 10 s. This plant is semi-stem-rooting. flowers are variable in yellow and red s, and all are characterised by copious oing, the more pronounced on the lower hirds of the segments; they are pendu- and of exceedingly graceful port. ted forms have been accorded varietal as flavum, a golden yellow, and ly spotted flower, and rubrum, a good of red, and also copiously marked. is a very satisfactory garden Lily, and be freely planted with every hope of ss. The bulbs should be placed where rowing and not too obtrusive plants will l protection to the young growths, while ccasional surfacing of good leaf-mould il be greatly beneficial. L. canadense sses in North America a wide geographi- ange from New Brunswick, Canada, to South-Eastern States of the Union; it und in moist situations, and should be ed in light shade and where the soil will t suffer too much from a prolonged ght. L. canadense was introduced so ago as 1829, and has been called L. liflorum. RALPH E. ARNOLD.

Celery and Leaf Miner

Its not surprising to see readers complaining bout the Leaf-mining Maggot. This is rst time I have had any trouble with it, dt seems pretty general, as far as I hear, tis part of the country. I cannot com- ai, as I am not the worst off, and the ars are fairly decent. It is a good thing ve a dusting of soot occasionally when liage is damp, and I also find watering cionally with soot-water and liquid-re before earthing-up is a good pre- ve, as it helps to make the foliage bitter, the maggots do not like.

It has been interesting to watch tits, and sparrows, devouring the maggots from lants, which I had never seen until this n. A CUMBERLAND GARDENER.

Riviera jottings

The recovery of frost-bitten Palms and ers in the south of France this autumn ry surprising to those who saw the ge done by frost and snow last winter, he casual traveller would not notice change on his first arrival, yet there ome blanks. Until the more favoured s reached between Nice and Mentone n Eucalyptus or Mimosa is to be seen. age trees have been cut down to the d, and no pink Ivy-leaved Geranium wering sprays of Bougainvillea are yet found. On the other hand, the Palms ooked dead in many places have made h crown of leaves, and the growth of ers is so luxuriant that they seem to benefited by the severe winter pruning. nly Bougainvillea now in flower is the B. Sanderæ, but I see such luxuriant h on those that were cut to the ground feel pretty sure we shall next spring e usual blaze of colour if we are blessed ordinary winter season. The Tree ha, D. Imperialis, has made extra-ary growth and should flower superbly the month of November. Salvias, of many kinds, are in most vigorous growth, and even the tender Salvia fruticosa and Bethelli are showing flower-bud.

There was a heavy downpour of rain in August that set off the Roses into growth before their time, and their growth is so extra luxuriant that one is at a loss to say what will happen. Flowers at present are poor with the continued heat and present rains, but such vigour should produce good flowers before Christmas. Carnations, Stocks, Anthemis, and other plants which dislike heat are less good than usual, and it will take both time and care to pull them round. Taken as a whole it is a season of extremes—plants are either extra vigorous or extra weak in growth. E. H. WOODALL.

Nice.

Gloxinias

THESE showy stove plants seem to be rather out of fashion, but quite undeservedly; for well-grown plants of Gloxinia are among the most desirable of room ornaments, and their various colours of red, pink, and shades of purple are nearly all of desirable decorative quality. They are plants of tropical South America, members of the family Gesneraceæ. In former years one of the troubles with Gloxinias was that the flowers hung their heads, but of late this defect has been largely overcome, and now, while many of the flowers stand quite upright, others stand out well and show off their glorious colouring, with often a delicate spotting in the throat. The subject of the illustration is one of pure white colouring. The plant has another attraction in the velvety texture of the leaves; one can hardly forbear stroking them for the pleasure of feeling their soft surfaces. G. J.

The Gloxinia is a desirable room ornament

Cratægus orientalis

Cratægus orientalis and its variety sanguinea are among the best of many fine trees and shrubs which give us beautiful blossom in the spring and handsome fruits in the autumn. They are now at the height of their brilliance and, growing side by side, form an effective contrast. The dry sandy soil seems quite to their liking.

C. orientalis forms a small tree, some 15 feet to 20 feet high, and, grown as a standard, has a somewhat loose, rounded head of branches, pendent at the ends. Var. sanguinea is a trifle more vigorous, and forms a flatter head. In shape, the leaves are very similar to those of our native Hawthorn; but those of the type are downy on the upper as well as the under surface, and, except when closely examined, the foliage looks quite grey, and proves an effective background for the fruit. The leaves of var. sanguinea are a dark shiny green. Both are free from spines.

The fruits of C. orientalis are roughly globose, with a suggestion of five shallow ribs opposite each persistent sepal, and are ¾ inch or more in diameter. They are borne freely on very short pedicels close to the branches, and in colour are an orange-red, developing almost to vermilion round the apex. Those of var. sanguinea are rather smaller, with barely a suggestion of ribs, and somewhat flattened at the calyx end. They are borne on short pedicels, but separated from the branches by peduncles ½ inch to 1 inch long, and are a clear maroon. Birds appear to have more preference for the orange-red fruits.

Lindley considered these two sufficiently wide apart to rank as separate species, C. orientalis to be called, appropriately enough, C. odoratissima, for in spring the tree is massed with very sweetly scented blossoms, ¾ inch or more in diameter. It was to var. sanguinea he gave the name C. orientalis.

C. orientalis is common on the Crimean hills, particularly those adjoining the Black Sea. It is unquestionably hardy, and a place should be found for it in every garden.

Wisley. E. K. LAWRENCE.

Storing Fuchsias

Many gardeners are at their wits' ends at this season to find room in which to store the many and various plants which must be housed, and to such we advise the storing of Fuchsias and many other hard-wooded plants in a cool, frost-proof shed, where no care will be necessary, after one good watering, until they are brought out to be pruned in February or March.

Royal Horticultural Society's Show

A random commentary

STOVE plants and Orchids, once the aristocrats of cultivated plants, have turned, in these days of enforced economy and changed taste, into plutocrats (thus reversing the natural order of development); and although the Show at Greycoat Street was announced to be chiefly for Stove and Greenhouse Plants, the hall seemed to contain at least as many shrubs and hardy plants.

Yet, so long as unfamiliarity remains an essential part of beauty, these tropical plants will continue to charm and attract us. They seem to be fashioned with a deliberate and finished artistry and, perhaps because they grow in the still air of forests, there is usually something solid and static in their design, so that they do not seem out of place among the rigid lines of an artificial setting. All their singular beauty was brought out by a really superb collection, which was set out across the end of the hall by Messrs. L. R. Russell, of Richmond, and must have recalled memories of the old, opulent days of horticulture to some professional gardeners.

The highly mannered beauty of Orchids seems to irritate some people, though I fancy that it is especially embittering to rock gardeners who have tried and failed to grow the hardy terrestrial Orchids; but, if we chose to call them morbid, grotesque, and decadent, this is surely because of our Nordic concept of a flower is founded on something like a Dog-Rose. And those who persist in attributing moral qualities to flowers are committed to avowing a firm preference for the chaste and simple, whatever their predilections may be.

Orchids would fascinate us even if they had no other quality than their amazing variety, ranging from the delicate intricacy of Vanda suavis, in carved and coloured ivory, to the unrestrained opulence of the Lælio-Cattleyas. Their colours transcend the range with which we are familiar in hardy plants; the group exhibited by G. Mayer, Esq., of Woldingham, which was awarded a prize for the best six Orchids shown by an amateur, included an Oncidium in pale brown, edged with yellow; Cypripedium Bellatulum in porcelain white, spotted with purplish black; an Orchid, whose name I have forgotten, in rich red, suffused with brown, and the bright green and white Cypripediums. I suppose that there are very few gardeners who would not grow Orchids if they could; and this suggests that there are more Orchids than is commonly supposed which can be grown in a frost-proof greenhouse, and that some of us would be glad to hear from the experts on this subject.

It was almost a relief to turn from the tantalising Orchids to the berried shrubs, especially to those that were generously shown in great boughs and young trees by Mr. Lionel de Rothschild and Mr. Vicary Gibbs, and discover how much variety and beauty they so easily provide. And yet
are many people saying: " Of course,
is nothing to be seen in the garden
now."

Among the newer shrubs, Pyrus pinna
Gibbsii from Aldenham was very stri
with bunches of scarlet fruit nearly as
Crab Apples, and Cotoneaster frigida
luteo, with berries in a very unusual sha
pale creamy yellow, Stranvœsia salici
with berries in dull lacquer red, and Co
aster glabrata, with very broad leaves
scarlet berries. Some black-berried sh
Acanthopanax and Eleutherococcus,
very handsome in contrast with the reds
yellows, standing out with the richne
the flat masses of black in a Japanese

Of the more familiar shrubs, Cotone
rugosa Henryi, with its graceful design
its load of scarlet berries, stood out ma
cently, and it is surprising that
Cotoneasters which form small trees sh
not be more generally appreciated.

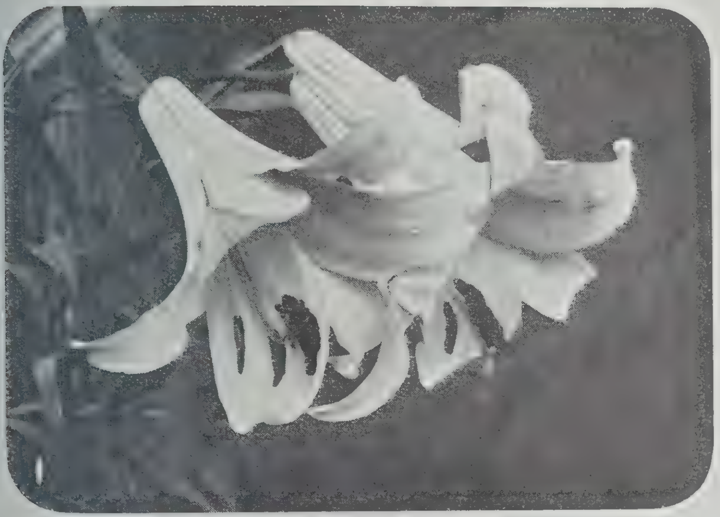
Orchids at Greycoat Street

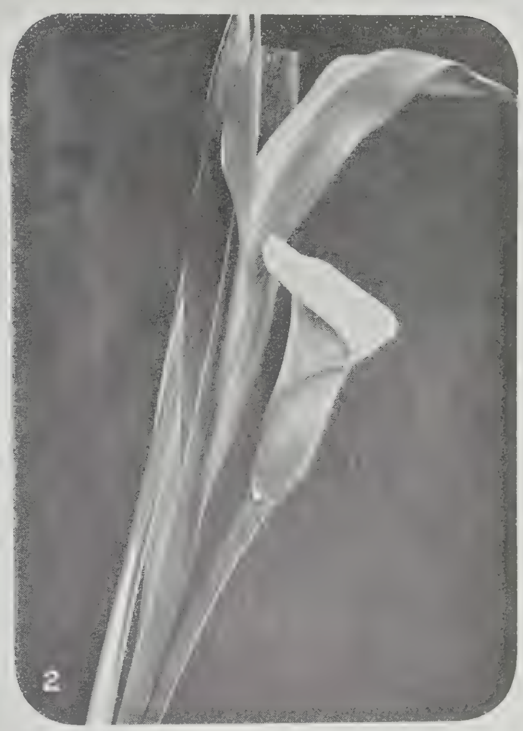
THE Orchid and stove and greenh
section of the Autumn Show was
ticularly noteworthy for the number
quality of the Orchids exhibited by amat

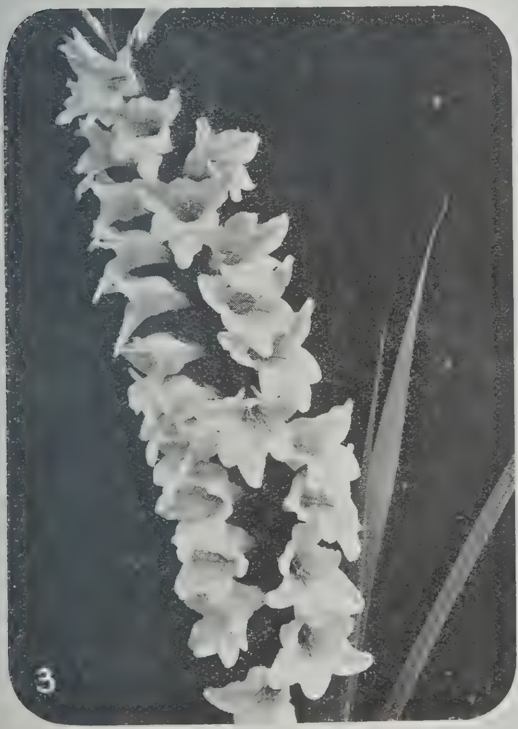
Apart from the displays arranged by
Trade, Messrs. Charlesworth, Mc
Stuart Low Co., Sanders, Alexander, Co
Dixon, and Evans, encomiums were lav
on, and thoroughly deserved by, the effe
groups shown by amateurs.

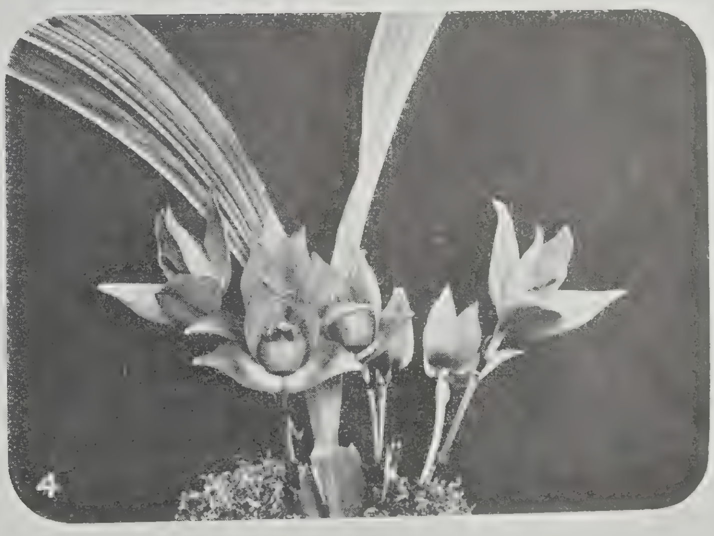
At this particular show special prizes

EEN AT THE FOURTH AUTUMN SHOW OF THE ROYAL HORTICULTURAL SOCIETY ON OCTOBER 23rd AND 24th









Lilium sulphureum. Shown by Col. S. R. Clarke, Borde Hill, ywards Heath. The large fragrant funnel-shaped flowers are pale sphur yellow, deepening at the throat and flushed with pink or claret red o the outside. A most beautiful Lily from Upper Burma. This species s shown in error as L. neilgherrense.

2. A pink-flowered Arum Lily (Arum Rehmanni). Flowers self pink. is interesting plant was brought from Rhodesia by Mr. W. Wells, rstham, Surrey, by whom it was shown.

3. Gladiolus species with 30 flowers and buds on one spike. This is a tender species (unnamed) from Port St. John, Pondoland, South Africa. The flowers are of soft, rhodomine pink, with carmine stripes. The foliage is like that of a Watsonia. Shown by Mr. Collingwood Ingram, Benenden, Kent. Award of Merit subject to being named.

4. A curious looking Orchid, Lycaste cruenta. This plant had a cluster of seven deep orange yellow flowers, about 6 inches high. The flowers are overshadowed by two large overhanging leaves. Shown in the Schröder Challenge Cup group by Mr. F. J. Hanbury, East Grinstead.

awarded to amateurs, but the intrinsic value of prizes by no means compensates for the time, trouble, skill, and forethought given. Mr. F. J. Hanbury, of East Grinstead (grower, Mr. Barnes), was awarded a Gold Medal and gained the Silver Challenge Cup presented by Baron Bruno Schroder.

For size the exhibit might well have been placed by one of the larger Orchid firms. Quality was of the highest, and in addition to many superb forms for which Mr. Hanbury's collection is noted, a large and varied number of Cattleyas, Oncidiums, Odontoglossums, Cypripediums, etc., were included. Well-placed was a plant of the now rare Cycnoches chlorochilon, with a single greenish-yellow and black-green male flower 6 inches or more in diameter, the more interesting as Mr. C. Garnett, of Derby, received an Award of Merit for a fine plant of C. Loddigesii, which had a spike of female blooms fully developed and an immature spike of male flowers, the two sexes occurring on one bulb.

Lælio-Cattleya Prince of Orange was particularly salient with an inflorescence of rich crimson and orange.

Mr. S. G. Brown, of Shepperton (grower, Mr. Thurgood), had a varied exhibit, including Cycnoches Loddigesii (the male form), Selenipedium macrochilium with 12-inch-long petals, Maxillaria lepidota, Mormodes Buccinator (flowers pale green and cream-pink), Epidendrum vitellinum, Oncidiums, Cypripediums, and Cœlogyne Mooreana.

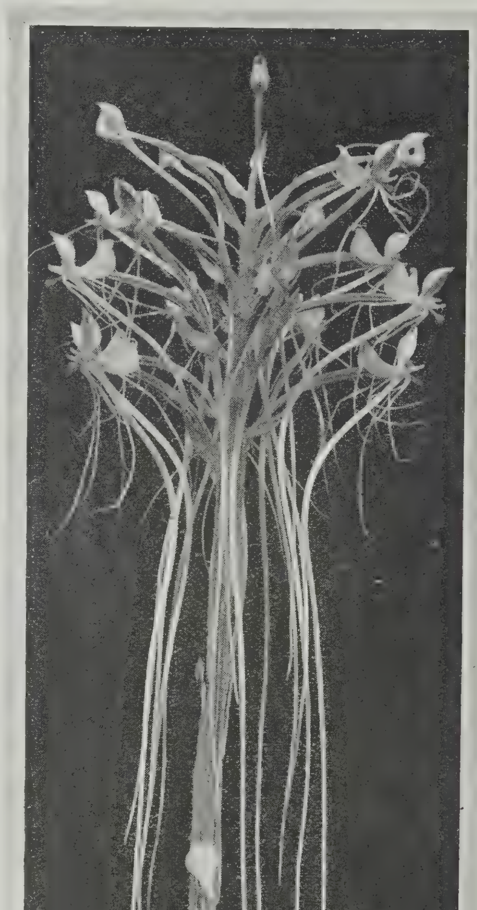
The Orchid Challenge Cup for the best exhibit of Orchids in a space not exceeding 60 square feet was won by Mr. R. Paterson, of Ardingly (grower, Mr. Merry). The group included some particularly emphatic Cattleyas and Lælio-Cattleyas. Vanda Luzonica (a Philippine Island species with habit resembling that of V. suavis, but with charming flowers of pure white edged with crimson), Vanda cœrulea, Odontoglossums, Oncidiums, Cypripediums, etc., completed a most meritorious group to which a Silver-gilt Banksian Medal was also accorded.

Another entry by Mr. J. J. Joicey, of Witley (gardener, Mr. MacKay), also contained a specimen of Vanda Luzonica, as remarkable as that in Mr. Paterson's group, but differing in the arrangement of colour. A specimen Vanda cœrulea, Oncidium Rogersii, numerous fine Cattleyas, Lælio-Cattleyas, and Cypripediums were prominent, as was a grand specimen of Bulbophyllum Rothschildianum, its rich, mahogany-tinted flowers having the upper sepal and petals tufted with crimson hairs. Cœlogyne barbata (white sepals and petals and sepia haired lip) and Cirrhopetalum longissimum (drooping flowers of silky white tinged with pink, the sepals 10 inches long) were much admired, and added variety to a well-balanced group.

A third competitor, the Right Hon. Lord Melchett, of Romsey (grower, Mr. Ruck), was awarded a Silver Banksian Medal for a well-staged group, each plant standing clearly out. Noticeable was Brasso-Lælio-Cattleya Yellow Hammer, Melchett's Variety (a beautiful piece of colour). Cattleya Fabia in variety, Cypripediums Minotaur, the white Boltonia, Golden Fleece, and Actæus Bianca were among the component plants, as were two nice examples of Calanthe Veitchii.

Mr. E. R. Ashton, of Tunbridge Wells (gardener, Mr. Kent), had one of the most varied groups possible for its size, a group which spoke well for the cultural methods used and the comprehensive nature of the collection. Among the plants noted were Cypripedium Fairrieanum, Miltonia candida, the graceful South African Stenoglottis fimbriata, very well-grown and well-flowered, Dendrobium Phalænopsis Schroderianum (one form exceedingly bright, contrasting with a pure albino), Oncidiums Forbesii and Rogersii, a beautiful form of Brasso-Cattleya Sofrano, with flowers in two shades of yellow and a light rose suffusion on the lip, and Odontoglossum grande.

Mr. Gus Meyer, of Woldingham (gardener, Mr. Cottam), won the silver trophy for the "twelve" Orchids, a representative lot of well-grown plants. A fine form with a golden-yellow lip of the Trumpeter Orchid (Mormodes Buccinator), Odontoglossum Zenon, to which the Orchid Committee gave a preliminary commendation. The large, shapely flowers were of a warm wine colour. Vuylstekeara elatior var. Lord Rothermere (bright red and white, derived from a trigeneric hybrid crossed again with an Odontoglossum), Sophro-Lælio-Cattleya Dora and Cypripedium bellatulum (both fine varieties), Oncidium Rogersii, Cattleya Portia, C. Mantinii, Vanda cœrulea, Oncidium Forbesii, Lælio-Cattleya Ivanhoe, and a well-grown specimen of the sweet-scented Vanda suavis. Though flowering so late in the season the plant, like all others in this group, was in full vigour.



Habenaria Lugardii, an interesting Orchid from the Congo

Flowers white and green, with very fine slender pendant spurs about 6 inches to 8 inches long. The flower is presumably visited by a long and very slender-tongued moth. The inflorescence arises from two broad, flat basal leaves. Award of Merit

Habenaria Lugardii

THE illustration represents a rem Orchid from Central Africa, exhib Messrs. Sanders at the R.H.S. n of October 23rd.

Habenarias and terrestrial Orchi widely distributed throughout the worl the probable exception of the frigid zo

The section of the genus in which L is included was at one time distinguis the generic name of Bonatea, di chiefly in the attenuation of the flor ments and two curious prolongation the rostellum.

The inflorescence photographed a sight seems to be composed entirely of filaments, but, though superficially d in reality the flowers structurally re those of the British Habenaria bifoli that species the segments are short broader, but the pollinia and the pro hood-like arrangement of the dorsal se similar to the same organs in H. Lugar

The plant shown received an Aw Merit. It may briefly be described as two large, fleshy, opposite green leave 6 inches long by 4 inches broad, resti the compost. From their centre ris erect stalk 20 inches high, light green ously ridged, or perhaps it would be to say adorned with thin, longitudinal A few whitish-green bracts are preser as leafy as the same organs in H. bifo

This terminates in some 15 or 20 fl quite attractive in the aggregate. Ea a slender white spur 8 inches in lengt tinted with green in certain lights. petals are reduced to white threads 1½ long, the sepals are the shorter and b of all the segments and of purest whit the two lateral reflex toward the 2-inc grooved ovary, which is based by a bract. The lip is apparently divided three filaments, the two outer of which the petals in length.

In front of the flower project two clu processes of deep green.

The whole section has a genera semblance and the colouring is gree white. Other species which have be cultivation are antennifera, from Rho speciosa, South Africa; and Ugandæ latter with a spur 5 inches long.

E. Coo

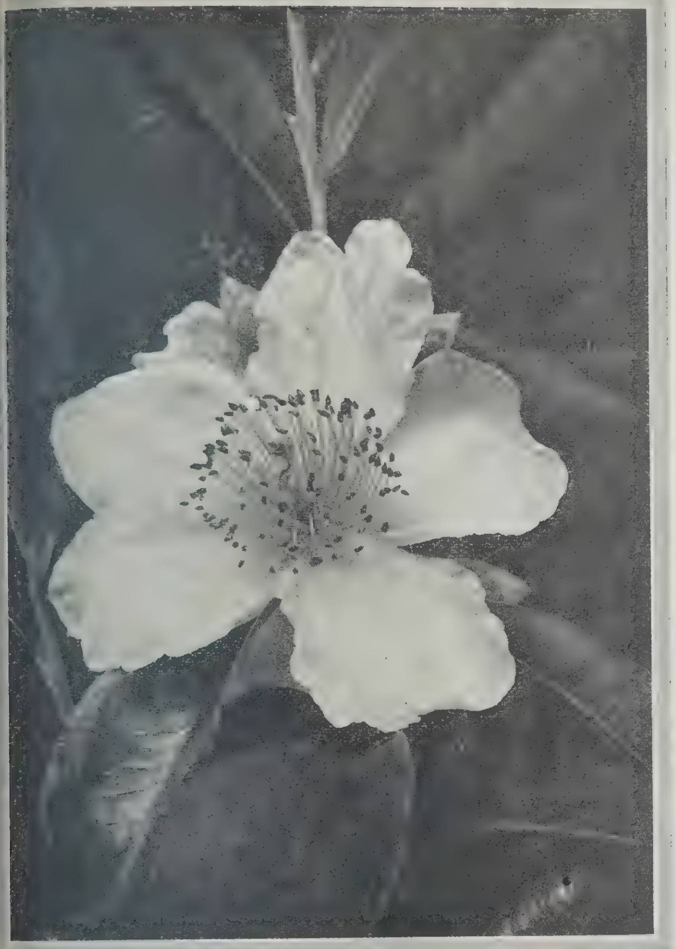
Aster Amellus Sonia

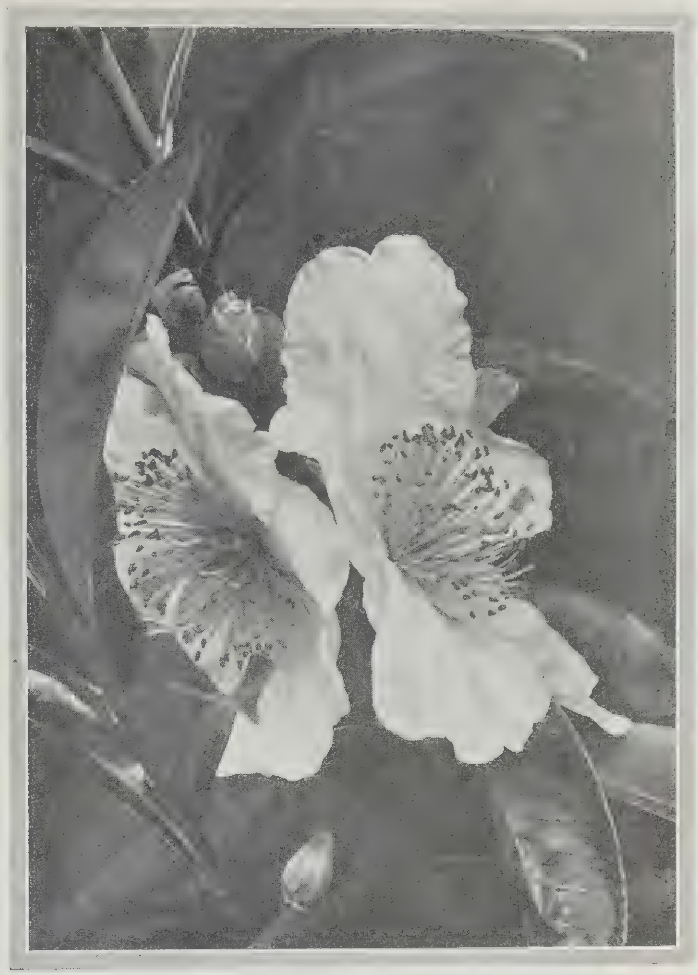
A visit to the Wisley garden of the Horticultural Society late last year conv me of the undoubted value of this bea new Aster of the Amellus type. This v should be in all gardens where the beau the large-flowered type of Aster is app ated. It received the Award of Merit year, and this award should give it the mark of distinction. I acquired stock o plant last spring and it is now doing well with me. I hope to have a lot of it year. The raiser describes the colou bright rose-pink, and it is quite true tha flowers are borne in profusion on erect s and on plants of robust growth.

D. B. Cra

Planting Roses

The formation of new beds and bo and the planting of Roses is now in swing, and no better time could be ch for the purpose. If plants are not cut way back upon arrival from the nurser will be advisable so to reduce them b planting. Remove also damaged portion roots, and shorten back extra long one this will ultimately benefit the plants. W planted the point of union should be below the surface.





Two pictures of Gordonia axillaris, a tender and lovely shrub from China

Shown by Major L. Johnston, Hidcote Manor, Campden, Glos. The large flowers, with innumerable golden yellow anthers, are 5½ inches across the broad white petals. The foliage is like that of a Camellia. It is one of the most beautiful shrubs of recent introduction. Award of Merit

Highland Glens and Highland Gardens

THERE is an idea prevalent in the minds of not a few southerners that Scotland after about the middle of September—when holiday folk and sportsmen have left the moors and anglers have made their last cast—has lost its charm, and that for the most part it is a region of mist and rain, cold grey, and uninviting. Suggest to them that in mid-autumn, notwithstanding days are shortening fast, the weather in the very west of the Highlands is often mild and genial, with spells of mellow sunshine pouring over the landscape, and they smile, possibly because their minds hark back to a holiday in which adverse weather played not unimportant part. Tell them, though Ling and Heather may have faded and wear a sombre look, that there are still points of gold upon the Gorse, and colour on the majestic mountain peaks as the trailing clouds of glory gather round them in purple mist, or when at set of sun they glow with the fires of heaven; that there is beauty in the tangled herbage which skirts the stream, and in the Bracken which slowly reddens to decay beneath woodland trees. Whisper to them that at this time of the year the glens are to be seen in their most alluring and captivating dress, crimson of Beech, bronze of Maple, and shimmering gold of Ash; that the Rowan trees are laden with bunches of scarlet fruit, and the true Fairies of the Glen—Silver Birches—still bear the weight of their soft amber foliage on fragile-looking branches. Yonder is a group of Scot's Pines, a century old or more, standing sentinel-like, veritable patriarchs in this lonely glen. Alongside the burns are still to be seen a few belated flowers of blue tufted Hairbells, and stray pink Campions are pushing their way through trailing stems of Bramble, now suffused with metallic tints, making delightful pictures worthy of the brush of a Macwhirter or a Peter Graham. Tell those who wish for a respite from the din and bustle and exacting duties of City life, and long for a complete change from every-day things and scenes, that it is good sometimes to get away where one may hear the music of woodland trees; to step out on to wind-swept moors; to breathe pure and unvitiated air; to wander by quiet waters of loch or still flowing river; to have a sight of the eternal hills; to watch the sun go down behind some rugged peak in a ball of fire, or to see through a clump of noble Pines the sky bathed in lurid light, softening to tender amethyst, ere darkness falls. Remind them that these joys are to be found in the open life of the Highland country, all within twelve hours journey of Euston! You may persuade some of your friends of this, while to others your words may fall on deaf ears. They may even look askance at you, scouting the idea of such a proposition as a holiday so far north by saying " Really, at this time of the year! "

Highland weather

It is true after Perth has been left behind there is a tang about the atmosphere of which Ian Maclaren, in praising the virtue of the air of Drumtochty, says: " It starts frae the Moray Firth and swoops doon Badenoch and comes ower the moor o' Rannoch and across the Grampians. There's the salt o' the sea and the caller o' the hills, and the smell o' the heather, and the bloom o' mony a flower in't. If there's nae disease in the organs o' the body, a puff o' Drumtochty air wud bring a man back frae the gates o' deith."

Of course, there are days in the Highlands when the weather is what our Scotch friends tell us " a wee bittie saft," when, to say the least, it is not prudent to stir far without being clad in thick boots, leggings, and mackintosh, but to-day is not one of these, and has no such drawbacks. It is a golden day, with a dreamy, subtle atmosphere, an almost translucent air, akin to that of the West Country about the Cotswolds, or the Weald of Surrey. Here in the glens is tranquillity. Trees stand motionless, as if conscious of impending change. It is their hour of colour triumph, as revealed in the splendour of their gorgeous dress. It is Nature's grand finale to her work. Soon will come the parting of the ways—the season of withering leaves. A few short weeks hence, at the most, and a night keener than the rest will set its seal upon them, bringing down " the wonder of the falling tongues of flame."

Highland gardens

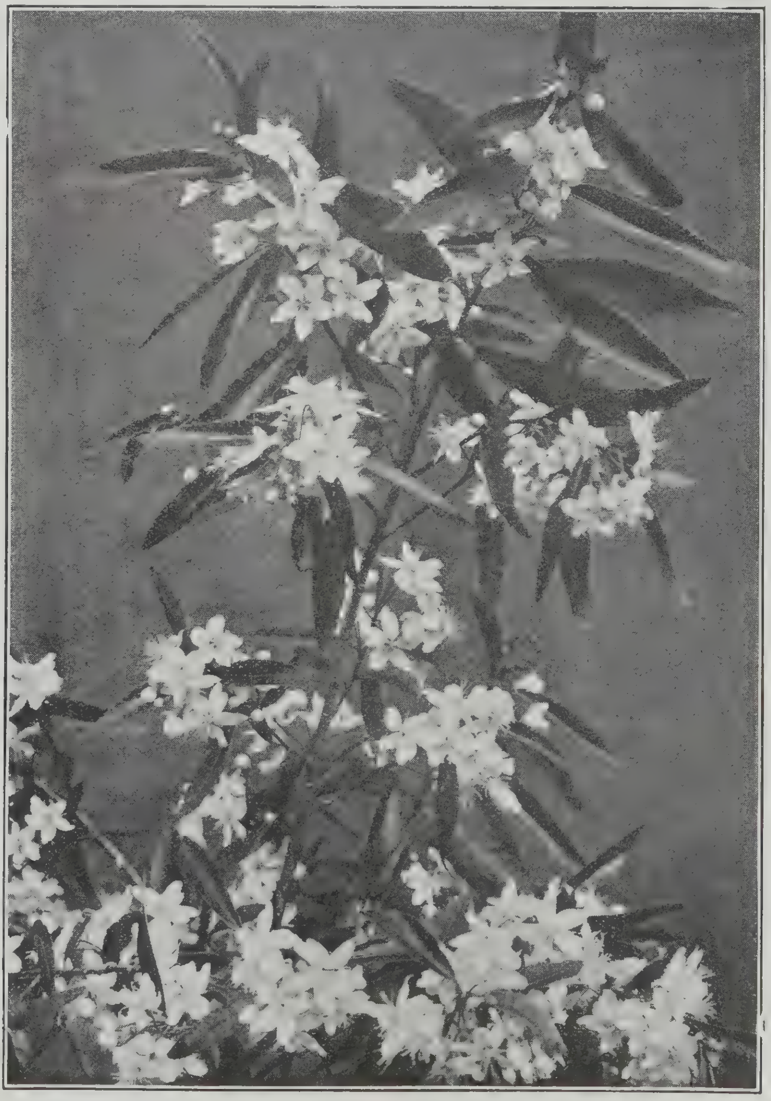
To those who take a pride in the culture of plants and flowers, and who love their gardens, there are garden spots even in the high altitudes around and north of Blair Atholl, away up the steep ascent of the

Grampians, beyond the summit of Dalwhinnie, which the trains climb as they make the journey to Inverness, that are beautiful yet. Hereabouts are crofters' cottages, with whitewashed walls and little patches of garden ground. They are bright with flowers, gold and orange Scotch Marigolds, Ten-week Stocks, scarlet Linums, showy Asters, Mignonette, and edgings of Candytuft. Cushions of Thrift, green as in spring, spread among rough stones on a border under a window, partly covered with gay Lichens. In some gardens Dahlias are yet in beauty, adding a touch of brightness, and Rambler Roses, with here and there a few clusters among faded flowers, cover low fences. In no part of the kingdom do you see that lovely creeper, Tropæolum speciosum, in so lavish a fashion. It has been rightly called the Glory of the Scotch Highlands. You come across it everywhere, a perfect blaze of vermilion clusters, borne amid trailing, almost irrepressible shoots of vivid green, thriving as well in wet peat-laden soil as it does amid limestone rocks in some other parts of the country. It is of parasitic growth, and is never happier than when clinging to something, a branch of a tree, or as is to be seen in the north, in a cold, moist environment—running riot over a thatched roof or fence. We pause to admire its rich prodigality and think of the little success met with when cultivation is first attempted in hot, dry, localities as in the south of England. Seen in this moisture-laden atmosphere of the Highland country by strangers for the first time, however, it seems to rivet their attention, and not infrequently they gaze at it in sheer wonder when they see the luxuriance of pale green trailing shoots and intense colouring of the rich flowers. On a wee shieling across the valley a Clematis clambers about a doorway in masses of flaunting purple clusters. The rough walls of this home, built of stones and turves, are thickly congregated with many plants, some obviously self-sown, Sedums, Bellflowers, Valerian, Creeping Jenny, and Sempervivums among the rest. The gable-end of the house itself is aflame with Virginia Creeper in vivid shades of scarlet and crimson and gold. In a little bit of ground under the window rosy-pink flowers of Loosestrife still give a glow of warm colour. A few spikes on a clump of Red-hot-poker stand like flaming torches. Gay winged butterflies flitter about clumps of mauve and blue Michaelmas Daisies, the flowers gradually deepening in colour as the air grows cooler in the long September twilight.

HIGHLAND SCENTS AND HIGHLAND AIR

Sweet as is the perfume of Thyme and other lowly-flowering plants about these wild moors, there is yet another scent—a familiar, fragrant, pungent smell which pervades the air, and one we have missed for a year, recalling delightful memories spent in the Highlands by moor and stream. It does not come from the flowers, but from the blue smoke of smouldering peat fires in cottage homes. Around us are stacks of
peat blocks drying for winter use, e
to make townsfolk, in these days of
coal, envious! Many of the flowering
in these gardens betoken careful cultur
others upon which, apparently, little
trouble has been bestowed, seem vig
and strong; more robust, indeed, than
in other gardens in the south. Wher
we visited the Highlands years ago we
puzzled to know the reason for this ex
ance in certain forms of plant life, be
the soil, in some districts at all events
not be described as rich, and we were
to the conclusion that one great facto
atmosphere—contributes largely in
purity of colour to flowers. Whereve
travels in the Highlands the same trut
presses itself on one's mind. It is the
unpolluted air from mountain and mo
which invigorates and woos back to
those who come here for recuperation,
gives vigour and beauty to growing
about these moors and gardens—a b
that never fails to charm those who, per
are only able to pay occasional visi
Scotland, but who leave with mem
stored with pleasant pictures, to be re
in fancy as they follow the ordinary rou
their daily life.

W. FOWK



Hoheria populnea, a choice and beautiful flowering shrub from New Zealand

Hoheria populnea lanceolat

A CHOICE and beautiful flow
shrub is this native of New Zealan
slender branches of which were
with lovely white, pearl-like buds
flowers. These are produced in clusters
the leaf axils, and are rendered even
lovely by the numerous stamens. The l
are slightly glaucous and of a bright,
ing green on the outer surface. A w
desirable for this very choice shrub i
south of England, but in the west I have
it perfectly happy in the open.

E. MARKHA

Roses—first blooms

WHAT has been to me very astonis
is the fact that after one of
severest spells of cold weather eve
perienced since I commenced to grow R
all my trees not only survived but have
a display of first blooms never before equ
Some of the trees in the spring cert
showed signs of the struggle to live d
the exceptionally hard frost, and I did
think I should have any June Roses,
with judicious pruning they soon bega
put up sturdy shoots, and the first to b
was a climbing Mme. E. Herriot on
20th which had a continuous show of
blooms. The yellows, which are usuall
susceptible to cold, have done remark
well, and Christine, Florence Izzard, M
Morse, Rev. Page Roberts, Mrs. We
Quinn, Golden Emblem, and Billy Boy,
attractive semi-single, all had a w
of first blooms. Ivy May, a charming but
hole Rose, resembling Mme. Butterfl
colour, had over a score of blooms
once. Two old trees, Grace Molyneaux
Pharisaer, which were pruned severely o
to their having become so large, sent
vigorous new shoots with a correspon
show of flowers. Red Letter Day, with s
double dark scarlet blooms, made a new s
over 5 feet high, and was a mass of col
whilst K. of K., a somewhat similar R
but more vivid in colour, with its branc
habit, has upheld its reputation as one o
best decorative Roses. Two purely si
Roses which can always be relied upo
give good results all through the summer
autumn are Isobel and Mrs. Oakley Fis
these have both been much admired, and
former may still be regarded as one of
finest, if not the finest, single Rose in c

n. The colour is carmine red, flushed ge-scarlet, in a very long and delicately-petal. A peculiarity this year has been in addition to the single blooms of five ls, I have had blooms with up to thirteen ls, all perfectly formed. Mrs. Oakley er is a rich orange-yellow, very florifer- Independence Day is, as usual, a mass loom, whilst those bearing larger flowers Gladys Holland, buff, shaded orange-w; Holt Hewitt, rich, velvety crimson; geous, orange-yellow, shaded copper-red; Silk, cherry-cerise, overshot with sal- and orange; and the two excellent es, Marcia Stanhope and Ellesmere—h are both sweetly scented, and there- preferred by many to Frau Karl Druschki ve all done well. Amongst others that a splendid show of first blooms were elia, Mme. Butterfly, Joan Davies, Fireflame, bush and climber, Old Gold, Angeles, Noblesse, General McArthur, elm Kordes, Sunstar, Clarice Goodacre, Henry Morse, Charles P. Kilham, Mme. riot, Col. Oswald Fitzgerald, Betty Up-ard, Betty, Donald Macdonald, and

pruned my Roses the first week in April, s my usual practice, but, as an experi-t, I left one tree (Polly) until a month , and found this made practically no rence in the time of flowering, so there ars to be something in the contention of advocates of late pruning that you get blooms quite as early, without running risk of late frosts. R. C.

erby.

New Carnations

he following new Perpetual Flowering ations have been registered with the rish Carnation Society:—

LADYS.—Seedling, salmon-rose, fragrance habit and stem good.

ADGE.—Seedling, orange flaked bright , slight scent, habit and stem good, but ter slow grower.

INA.—Seedling, heliotrope (Mikado our), fair fragrance, good stem, and habit rowth very free. Registered by C. Engel-n, Ltd., Saffron Walden.

OBEL HAMILTON.—Seedling, rich light , slightly scented, stiff stem, free habit growth. Registered by Walter Hemus, . Hawarth, Middlesex.

ADA.—Seedling, salmon-pink, habit and good.

NNY BOY.—Seedling, cerise, habit and extra good. Registered by A. F. Dutton, Nurseries, Iver, Bucks.

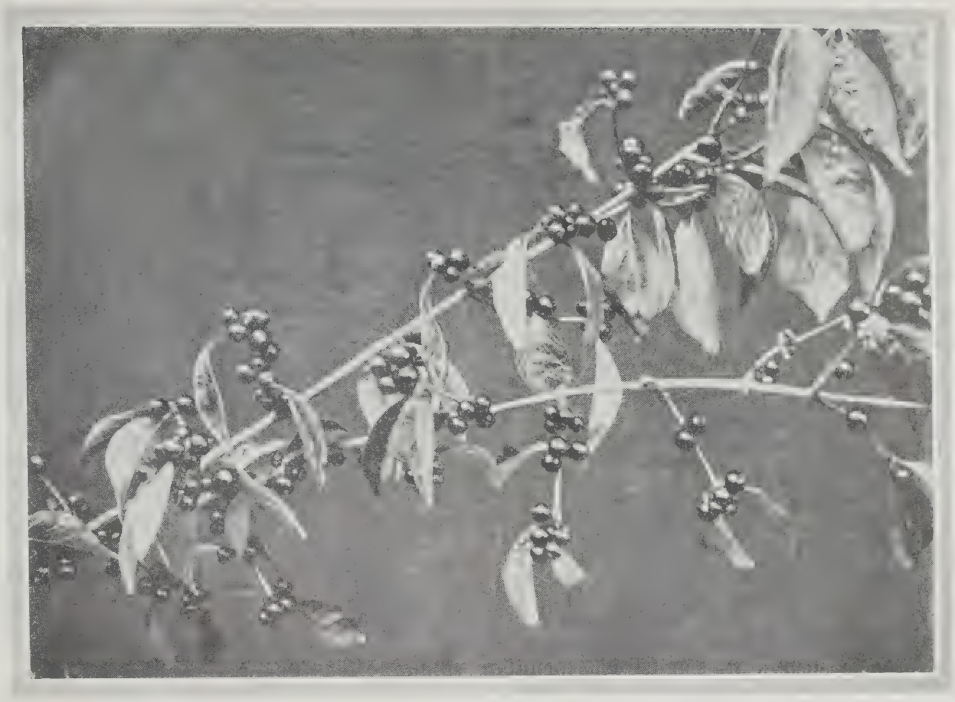
Senecio abrotanifolius

plant well adapted to associate with ts on the moderate-sized rock garden is Senecio abrotanifolius, from the Enga- and Eastern range of the Alps. Where ted in suitable conditions, it forms a nct feature of the rock garden, if there ace for its trailing branches, which are times a foot long. Its vivid orange ms create a striking effect, especially when planted with some of the Alpine Campanulas, and a few plants of S. abrotanifolius mingled with such Campanulas as C. rotundifolia or any of its Alpine sisters of similar growth. The trailing branches, clad with deep green, glossy, fern-like leaves, bear the flaming orange flowers. S. abrotanifolius loves a peaty soil, well mixed with stones, and a dry position with ample drainage. It is increased by seeds or cuttings.

S. ARNOTT.



Lonicera Hemsleyana, with translucent fruits like Red Currants, and about the same size and colour

Shown in large well fruited branches in the Gold Medal Collection of Shrubs from Mr. Lionel de Rothschild, Exbury, near Southampton

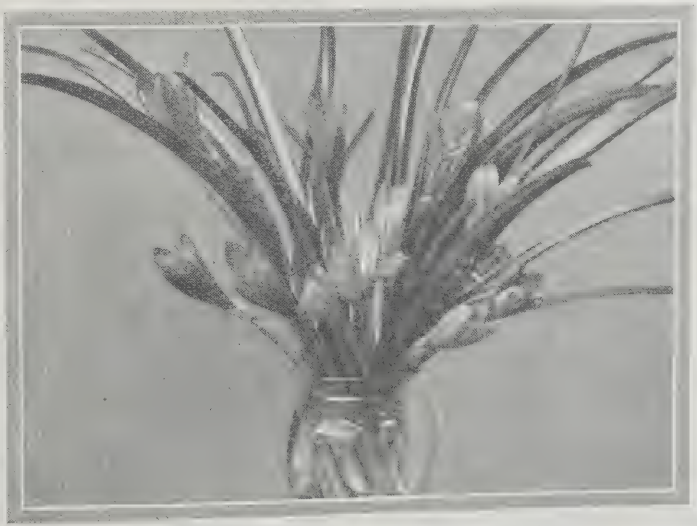
Geum bulgaricum

The plant almost universally grown as Geum bulgaricum is not, on very high authority, the true bulgaricum. It is some consolation, however, to learn that the true bulgaricum is a worthless plant, with big foliage like "washed-out green flannel and clusters of bloodless, pale yellow flowers," while the plant which masquerades under the name of G. bulgaricum is neater, and bears glowing flame-like flowers. It is about 6 inches or 8 inches high, with pretty foliage of the characteristic form of the Geums, and blooms for months in summer and autumn. It needs no special culture, and flourishes in any decent garden soil. It is easily increased by division, while its hardiness is beyond reproach. Some consider that the proper name of this good plant should be G. Borisii, for which another Geum does duty in gardens.

S. ARNOTT.

Spring bedding

The various bulbs should all now be got in, as also the other plants used for a spring display, such as Myosotis, Polyanthuses, and Wallflowers. As with other plants, however, the ground must be reasonably dry when such work is being carried out, or it is very apt to become sour and unhealthy.



Sternbergia lutea from an open border

Shown by the Duke of Wellington, Ewhurst Park, Basingstoke, at the last meeting of the Royal Horticultural Society

REMINDERS FOR THE WEEK

Southern and Midland

Pruning fruit trees

A start may be made upon Apples and Pears without delay, for although such work may be carried on more or less all through the winter months (the exception being frosty weather), it is advisable to attend to trees in exposed places and those growing upon vegetable plots as early as possible, in order to allow of the ground being dug or trenched, as the case may be. Such work is also carried out more expeditiously if commenced before the bitter weather arrives. Orchard trees, both of Apples and Pears, should never be permitted to become congested, and no hesitation should be shown if it becomes necessary to remove a large branch to admit of light and sunshine to all parts of the tree, dressing all large wounds either with Creosote or Stockholm tar.

Planting fruit trees and fruit bushes

The present is an ideal time for this operation, and I advise all who possibly can to get the bulk of their trees planted and settled in as early as such work can be conveniently done, for although we may plant all through the winter—soil and weather being favourable—early planting is by far the most satisfactory. Trees arriving from nurseries should be soaked by immersion in a tank of water if the roots are at all dry, pruned, and examined carefully for any damaged roots, which should be cut away. A barrow-load of fine soil containing a third of wood ashes should be reserved to work in among the roots as the work of planting proceeds, as the latter are very partial to wood ash. Place a good stake to each tree when standing the latter in its position, and, after arranging the roots in tiers, finish off with the uppermost roots 3 inches below the surface.

Fruit trees under glass

The planting of these may be carried out at any time, as in this instance we are no longer victims of the weather. Vines, Peaches, Figs, and others may be planted or root-pruned, as the case may be, whenever it is convenient to do so.

Early vinery

The pruning, cleansing, and dressing of the Vines must be commenced so that all may be in readiness for starting the rods into growth. All glass must be washed and walls given a coating of fresh lime-wash. In the meantime, the house should be kept as cool as possible.

Climbing plants

All hardy kinds may now be planted and among them, in addition to the great variety of Roses, are many extremely interesting and beautiful subjects, such as Clematis, Vitis (of which Mme. Coignet's Vine is one of the best), Vitis vinifera purpurea, Lonicera tragophylla, the largest flowered Honeysuckle which can be grown in the open air, and L. etrusca var. gigantea, Escallonia langleyensis, E. Donard Seedling, Actividias arguta, chinensis, and Henryi, Tecoma grandiflora, Mme. Galen, Polygonum Auberti, Wisterias, Celastrus articulatus, Ladsura japonica, Pilostegia viburnioides, and Solanum jasminoides, to mention only a few.

Lawns

Mowing having finished for the season, all the machines—after a thorough cleaning and oiling—should be stored away in a dry place. Leaves will prove troublesome for a time on the grass, but must be cleared away at intervals, otherwise yellow patches will follow. Attend to all worn parts and those impoverished, by enriching the soil, or replacing same, and returfing with freshly-cut material. A dressing of Peruvian Guano at the rate of 2 ozs. to each square yard will effect a great improvement where the grass has lost its colour.

Planting Lilies

Many of these may now be planted in the open, preferably among dwarf, peat-loving shrubs, such as Kalmias, Azaleas, and Rhododendron. Although many are perfectly happy in beds and borders of mixed flowers, Lilium Regale, L. sulphureum, speciosum, melpomene, lancifolium album, the Orange Lily (L. croceum), L. giganteum, and L. cordifolium, Henryi, Davidii, auratum, platyphyllum, Martagons, Willmottiæ, and Sargentiæ are a few worthy of the planter's attention.

Swedes

A slight demand usually exists for a few garden Swedes, and where these are grown it is advisable to lift and store them at the present time, as this admits of the ground occupied being manured and trenched for a spring crop. A few roots of Horseradish should also be lifted and placed under cover in a cool shed.

Draining in the kitchen garden

Where this has become necessary, it will be advisable to put the work in hand before the heavy and continuous rains set in, and thus allow the work of digging and manuring to go forward. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The cold frame

The novice is very apt to coddle unduly the occupants of his cold frame, and by doing so frequently loses the bulk of them. It must be remembered that all these plants or cuttings are practically hardy and, therefore, do not really require more than just slight protection during the coldest part of the winter. Whenever frost is absent the sashes should never be closed, as damp rather than cold is the cause of most of the trouble. The sashes should be tilted at the back, for this method protects the occupants from rain while permitting a current of fresh air to circulate among them, and so preventing damping to a great extent. During frost keep closed, with a mat thrown over the sashes.

Early Vines

Where really early forcing is practised, it will be now necessary to prune and clean the Vines, and also thoroughly cleanse the house. If necessary, a top dressing of fresh rich loam should be applied, after removing a few inches of the old soil. Do not begin with a high temperature, as it is invariably better gradually to increase the warmth after growth has started.

Chrysanthemums

These are much earlier than usual this year, and it will be difficult to retard the Christmas varieties so that they are at their best at the festive season. Give as much air as possible, but try to avoid draughts, for mildew will be certain to be troublesome under such conditions. Give fire-heat only when frost threatens.

Rose planting

With the mild autumn, the plants have continued to grow and bloom with great freedom, and if the present mild conditions continue it is difficult to see when the plan
likely to come to hand. If possible, how
have the ground thoroughly prepared, s
the actual planting may be carried o
soon as the plants arrive. That is, of c
if the soil and weather are favourable.

Keep all tidy

With autumn storms and falling leav
is not at all an easy job keeping things
but it is so depressing to have lawns
paths littered with debris, that it behove
to endeavour to keep such from accumul
too much, as the presence of large wreat
leaves on lawns seriously disfigure the

Pruning bush fruits

It is well to push on with this work
still the weather is comparatively mild,
is by no means a pleasant duty when
ground is frozen hard or is sodden with
rain.

Planting fruits

With the exception of Strawberries

Preston House Gardens, Linlithgow.

The Rock Garden Society

good that lovers of Alpines and rock ens should form a Society. It is sur ing that they have not done so before

E preliminary meeting of the Rock arden Society was held in the R.H.S. ew Hall on October 23rd. The Chair ken by Sir William Lawrence, Bt., and was a good attendance of those interin Alpine plants and in the formation of ardens.

William Lawrence outlined the objects proposed Society, viz :—To give advice making of rock gardens and the grow- Alpines, to arrange for discussions on ltivation of special plants, to publish ly bulletin, to exchange plants among ers, and possibly arrange for lectures on ing Alpines and their cultivation.

ing started the ball rolling, Captain ns-Jeune emphasised the need for two distinct sections, those who grow s for the sheer love of the plants, and who appreciate rocks for their beauty in setting. Captain Symons-Jeune ery enthusiastic, and went so far as to at rock gardens at Chelsea should be ted to, say, 30 tons of rock apiece. Mr. Perry assured the meeting that the ociety would have the full support of tide, and expressed a wish that aquatic and water gardening should be in- in the Rock Garden Society.

Chairman explained that rock garden- s a very elastic term, and would include nts associated with the rock and water

annual subscription of 10s. 6d. was ted, and the following provisional ittee was nominated to draw up the of Constitution of the new Society :— William Lawrence (Chairman), Dr. ispe (Felixstowe), G. Yeld (Gerrard's s, A. Perry (Enfield), Captain Symons- (Old Windsor), Th. W. Ingwersen Grinstead), G. P. Baker (Sevenoaks), Cowley (Editor GARDENING ILLUS-), Miss Victoria Slade (Bodmin), A. (Colwyn Bay), J. Renton (Perth). Committee will meet at the R.H.S. all on November 5th, at 3 p.m.

next issue will be mainly devoted to rs, and will contain among other special an article by Sir William Lawrence Rock Garden Society.

Campanula Weatherbyi

bears a considerable resemblance to hylla, but has deeper coloured flowers, of a uniform purple-blue with deeper ed veins early in September. It has a ct habit, the leaves lying close to the , the erect stems of solitary clear blue being abundant and scattered in a idal manner along the short, branch- ms. Although like the old Campanula ur, it is unlike it in its dwarf, close usually flourishing at 1 inch high. It freely enough, but does not spread with coarse vigour like many of its . It is hardy and enduring in good, oils and grows well with me on rich, ained loam. One of its chief charms it produces its numerous flowers when is a dearth of flowers in the rock . It is well, however, to encourage its wering habit by placing it in a position, where the fine flowers may be to open well. Although perfectly it does not possess the vigour of the n Campanulas, but it is valuable as a ant, and is fitted for association with Alpine flowers in warm, sunny parts of k garden in well-drained, sandy loam. of slender and wiry growth, a top dress- lime, stone chippings, loam, and sand should be worked in about the plants in early spring. This, in addition to providing the plants with nourishment, will help to protect the young growth from slugs which show a decided liking for Campanulas.

H. STEVENS.

The Millgrove Challenge Trophy for Chrysanthemums at Edinburgh

The Imperial Fruit Show

Winning Apples at Birmingham

THE ninth Imperial Fruit Show, which was on October 25th opened at Bingley Hall, Birmingham, by H.R.H. Prince George, is being held there all this week, closing to-day (November 2nd).

This appears to be the most successful yet held, from every point of view. It is generally agreed that in the five years which have elapsed since the Show last visited Birmingham many valuable lessons have been learnt, and that it has been accepted that "quality pays," to employ the phrase used by Prince George. One exhibit, that of Messrs. T. and M. Dixon, in the 50 boxes cooking Apple class, British Empire Section, won its first place with no fewer than 97 points, and only one point separated it from the second place winner. In the same section, but for dessert Apples, in an exhibit of 50 half-boxes, 96½ points were awarded to Cox's Orange Pippin, shown by Mr. F. Paget, Norbury. In fact, so high a standard of packing and quality has been reached this year that, with a few exceptions, nothing below 90 points had a chance of getting into the awards list. In a class that comprised 13 exhibits, thus representing 13 tons of cooking Apples grown in Great Britain, Messrs. T. and M. Dixon secured for that essentially English cooker, Bramley's Seedling, the honour of being the chief winning variety and the outstanding fruit at Bingley Hall. The 97 points out of a possible 100 suggests the almost perfect Apple. Although there were other exhibits of this variety in the 50-box class, they did not come into the final reckoning, and the entry which came out on top was closely challenged by Monarch at 96 points, with Bismark (94¾) very close behind, both these being entered by Messrs. W. Seabrook and Sons, Ltd. This firm had five tons of fruit on exhibition, and one of its exhibits in the 50 half-boxes class was awarded the third prize in the Worcester Pearmain exhibit (92¾ points), shown against Cox's Orange Pippin, which was placed first and second in a strong class, Mr. F. Paget, Norbury, carrying off the blue riband. Most of the fruit showed a remarkable freedom from blemishes ordinarily associated with fruit, and the bulge bruising which was very prevalent last year was almost non-existent.

It was only to be expected that the point of interest should shift from year to year. The introduction of the ton class of Bramley's Seedling provided a feature of the 1928 Show. The new idea of 1929 was the exhibiting of Cox's Orange Pippin in trays, an idea which immediately caught on. Since both cheek and eye showing forms of traying figure in the awards list of the two sections, championship and ordinary, the Judges have hesitated to give a lead, but it is worth knowing that while there may possibly have been other factors, the eye-up method was employed in four out of the six prize winners. Pointing ran high, and the exhibit entered by Mr. C. B. Shepherd, which achieved the distinction of 96½ points, was 1 point ahead of the "Championship" Cox's shown by W. Seabrook and Sons, Ltd., and thus qualified for the R.H.S. Gold Medal. Worcester Pearmain, shown by Reading University in Class III., U.K. Championship Section, reached 96½ points and secured the other R.H.S. Gold Medal. The "Fruit Grower" Gold Medal for half-sieves was awarded for King of the Pippins shown by Mr. J. Morton. Mr. R. J. Burrell, the winner of the other medal, exhibited Allington Pippin.

This year's Show is again under the Chairmanship of Sir William Lobjoit, and Mr. H. V. Taylor is the Chairman of the Schedule Committee, with Mr. J. F. Tamblyn, Secretary.

The forthcoming Chrysanthemum Show in Edinburgh

THE prize schedule of this important winter show is in our hands, and we note that a very comprehensive and interesting list of classes, with substantial prizes, has been got together. The principal award, to be known as "The Millgrove" Challenge Trophy, a photograph of which we reproduce, is for six 10-inch vases of decorated Chrysanthemums, disbudded, and not more than 12 blooms to a vase.

The number of classes for Chrysanthemums (cut flowers) number 17, while there are five classes for pot plants, seven classes for fruit, and 14 for vegetables.

The show is to be held in the Drill Hall, Forrest Road, Edinburgh, on November 21st, 22nd, and 23rd.

The show is to be under the patronage of the Royal Caledonian Horticultural Society, while schedules and full information may be had from the Organiser, Mr. D. Sharp, 9, Waverley Market, Edinburgh.

The want of such a show during the last dozen years or more has been keenly felt by many flower-lovers.

Kingston and Surbiton Chrysanthemum Show

The twenty-second exhibition of the Kingston and Surbiton Chrysanthemum Society will be held in the Assembly Rooms, Surbiton, on Wednesday, November 6th, when a good show is anticipated. It is hardly necessary to remind those who attend this exhibition of the high standard of quality of the Chrysanthemums and hardy fruit shown at this exhibition. Schedules may be obtained from the Hon. Secretary, Mr. W. H. Divers, "Westdean," Hook, near Surbiton.

Report on condition of horticultural crops

Broccoli.—In Cornwall the crop is in excellent condition, though there is some caterpillar damage. In Lancashire and Cheshire conditions have improved and present prospects are fair to good.

Brussels Sprouts.—In Hunts. there has been material improvement since the rains, but fly is prevalent. In Bedfordshire the recovery has been less marked, and supplies are considerably reduced; the Sprouts, also, are small and of poor quality. In Essex fly has reduced the crop. In Middlesex good supplies are obtainable.

Cabbage (spring sown).—Improved in Middlesex and good supplies available. Fair in Lancashire.

Cabbage (autumn sown).—In Middlesex planting out is in progress under good conditions. Making good growth in Lancashire. In Lincs. (Holland) planting out is practically finished and plants have become well established.

Celery.—Crops good on fen soils, but below average on uplands. In Lancashire growth has been affected by blight and fly, whilst in Lincs. (Holland) fly has caused serious damage, and the crop is likely to be poor in consequence.

Sea Kale (for forcing).—Satisfactory on the whole. Crowns now beginning to ripen.

Chrysanthemums (outdoor).—Blooms satisfactory generally, though small i
places. Recent spell of favourable
has prolonged the cutting perio
Cheshire the crop is very good, being
cent. above average.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish pl
be named should send fair examples of ea
stem, leaf, flower, or fruit. (Snippets of
and points of shoots are useless.) Not mo
four plants should be sent in any one week
same correspondent. Where more than o
is sent they should be numbered. Of conif
cones should always be sent.*

Naming fruit—*Several specimens in d
stages of colour and sise of the same kind
assist in its determination. Single, unr
deformed specimens are difficult to nam
do not undertake to name more tha
varieties at one time.*

seeds. P. Willmottiæ is another very st
plant when in fruit.]

Saponaria ocymoides

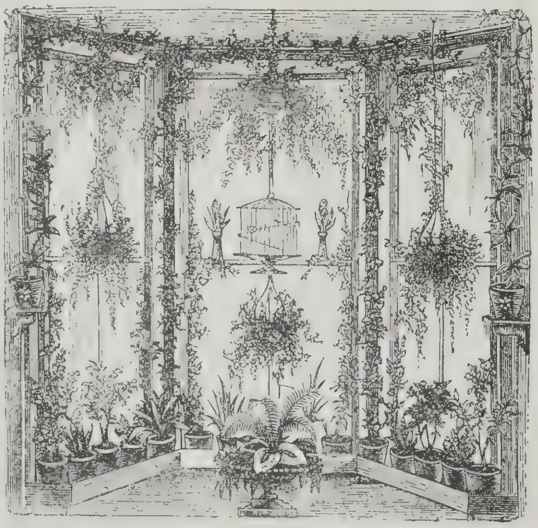
(L. B., Ohio).—This is usually one
easiest of plants to grow, and is a nat

From Gardening Illustrated

Fifty Years Ago

Basket plants for windows

THESE should be much smaller than those used in the conservatory, and they will also require to be filled with half-hardy or hardy plants. The Japan Saxifrage (Saxifraga Japonica) and Mother of Thousands (S. Sarmentosa) are well suited for window baskets, or as bracket plants. Campanula gracilis and Sedum Sieboldi are also suitable for the window, and a plant of Fragaria indica may be used. This plant droops gracefully 12 inches or 18 inches below the basket, and bears numerous small white flowers and crimson fruits, as large as Hazel nuts, among its fresh green foliage. The common Lysimachia nummularia (or Creeping Jenny, as it is frequently called) is a good plant for window baskets. It grows profusely if liberally watered, and its fresh foliage, borne on gracefully-drooping stems, is very refreshing to the eye, and effective in toning down the colours of flowering plants near it. The common Musk, planted in a basket, grows well, and is a desirable plant for its perfume. Flowering plants of various kinds, especially such succulent plants as the Mesembryanthemums and Echeverias, may be added, as they grow freely and require but little attention. Many hardy and exotic Ferns may be grown in the window, and one of the prettiest little plants for this purpose is Asplenium flabelliforme. In making up window baskets, it is best not to employ plants of a tender or uncertain nature, but rather to rely on good old hardy or herbaceous kinds, which grow and flower with but a little care and attention.—*May 24th, 1879.*



wiss mountain sides. It is, therefore,
lt to account for your trouble, unless
ks moisture at the root when half
ped. We advise you to try a plant or
partial shade, and, if these fail, change
stock by raising a few plants from seed.

you.

border

(W.).—Large-flowered Delphiniums
on on in pots would replace the Wall-
rs, but as these are over early in the
n they should be planted a yard apart
Cynoglossum amabile (raised from seed
in warmth in March and pricked off
boxes) used to carpet the ground be-
en the Delphiniums. This fine plant
s into bloom at the end of July and is
ive until frost comes. Salvia patens
also be used to follow the Wallflowers
would bloom all the summer, being lifted
the ground is required for Wallflowers
and stored away like Dahlias. The
nal Delphinium, Blue Butterfly, raised in
h and planted out in May is worthy of
notice, as it flowers throughout the sum-
Salvia uliginosa is a fine late-blooming
flower. Then there are the Linums,
as L. narbonense, L. perenne, and L.
sii, which are long and continuous
ning. Of annuals the following are
but are liable to collapse suddenly
g a period of drought:—Viscaria
ta cœrulea, Phacelia campanularia,
la Miss Jekyll, Nemesia Blue Gem,
allis grandiflora cœrulea, Brachycome
ifolia, Anchusa Blue Bird, Cornflower
ror William (sky-blue), Lupinus affinis,
phila insignis, Salvia farinacea, Ver-
hybrida violacea.

GREENHOUSE

arch of the East

(E. R.).—The so-called Lily to which
refer is most probably Sauromatum
um, which belongs to the Natural Order
æ (the Cuckoo-pint family), and is not
L. It has been given a variety of com-
names. This plant flourishes in a warm
house in a compost of light, rich, sandy
and leaf-soil, and should receive plenty
isture when in growth. Instead of be-
grown, however, the tubers are often
in fancy bowls, or even on the mantel-
without any water whatever. If the
rature is high enough (65 degs. to 70
Fahr.) growth commences, and the
hment stored up in the tuber is suffi-
to produce the flower spathes without
r attention.

TREES AND SHRUBS

angea leaves blotched

B., Hudds).—The plants have ap-
ly been overdosed with alum in the
t to turn the flowers blue. There is
ease present in the specimen sent, and
no reason why the plants should not
out of the blotches next year, but it
ke time. It is probable that the cuttings
fresh soil will show the same tendency
me months. You do not say if you
pink or blue flowers next year. A
n should be made early if alum is
l, only as the flowers open the results
ually unsatisfactory.

Cupressus hedge

(J. L. F.).—We have carefully examined the specimens of Cupressus macrocarpa and can find nothing present that would account for the die-back. It is possible that root trouble has developed, or it may be only the effect of the dry season. We get many cases of failure of Cupressus macrocarpa as a hedge plant, especially after it has been planted a number of years. That it makes a delightful hedge plant we admit, but under some conditions it appears to be difficult when kept clipped. There is no fungus present in the material sent.

Berberis Wilsonæ not fruiting

(A. C. G.).—Your Berberis are probably growing too luxuriantly, otherwise we see no reason for their failure to fruit, providing they are in full sunshine. Drive a spade down to its full extent at 12 inches to 14 inches from their centre in a circle, and thus check their vigour; this should have the desired effect.

Raising Pyracantha, Rose species, Cotoneaster, and Berberis from seed

(A. C. G.).—All may be easily raised from seed, which should be gathered when fully ripe; this is generally about the beginning of November, or at any time when the seeds come off the growth without hard pulling. The seeds should then be stored in moist sand until March, when most of the pulpy exterior will have decayed, and the sand may be separated from the seeds by a fine meshed sieve. The latter may then be sown in pots or pans of sandy soil, and raised in a warm frame or greenhouse, where they must be shaded from bright sunshine. The Berberis will germinate in a few weeks and a few of the others possibly, but the main batch will take a year to germinate.

ROSE GARDEN

Tea Rose Comtesse de Nadaillac

(S. W., Clifton).—This beautiful Rose is offered by Thomas Rivers and Son, Ltd., Sawbridgeworth, Herts.

Pot Rose

(Juno).—We have examined the specimen Rose leaves and there is no sign of fungi or insect pests. The coloration seems to be natural autumn colour, and we think that if you give the Rose a rest by standing it out of doors for a few months it will start again next season without any trouble. The pot should be plunged in coal-ashes to protect the pot and roots from frost. Roses will not grow all the year round and must be rested for a time.

CHRYSANTHEMUMS

Exhibiting Chrysanthemums

Would you please tell me how the points are given for Japanese Chrysanthemums for exhibition, and out of the following varieties which would you select? The class is for 18 blooms, not less than 6 varieties. Also how to stage.

Charles Davis, Mrs. B. Carpenter, Majestic (yellow), Mr. Lloyd George, Mrs. R. C. Pulling, Majestic, Balcombe Beauty, Mrs. J. H. Bernier, Mrs. J. Bromley, L. W. Weldon, T. W. Pockett, Louisa Pockett, W. Turner. Blooms to be shown in 10-inch vases. "Regular Reader."

[It is rather difficult to say just how points are awarded at the particular show you intend to compete at, but size, without coarseness, freshness, good colour, and good balance (blooms to be of fairly uniform size) are mainly taken into consideration by judges. While you state that 18 blooms, not less than 6 varieties, are to be shown in 10-inch vases, you say nothing as regards the number of vases. If six are allowed, we would place three blooms of a variety in each, and from your list would choose:—Mrs. B. Carpenter, Majestic, Louisa Pockett, T. W. Pockett, Mrs. R. C. Pulling, and Yellow Majestic. This gives you no deep red variety, but as Mr. Lloyd George is too small for exhibition, except in the decorative classes, you have none of this colour in your list. Charles Davis and Balcombe Beauty are decorative varieties, while the others, L. W. Weldon, Mrs. J. H. Bernier, and Mrs. J. Bromley, we do not know, nor can we find them mentioned in any catalogue.]

Wintering Chrysanthemums

(G. T. B. B.).—We have some doubt as to Chrysanthemums wintering safely in the cellar, as you suggest, and we think that you lost many of them last season through having buried them too deep with fibre, thus excluding light and air. If your cellar possesses a window you might try a few in the manner you suggest, but the remainder should be left in the open with their old growths on them—this serves as a protection—and either straw, Bracken, or similar litter should be packed around their collars, a little being spread among their tops during severe weather only and removed during mild spells. In heavy soil it is a good idea *slightly* to raise the plants with a fork.

VEGETABLES

Diseased Onions

(R. G., Dumfries).—The specimen Onion is attacked with White Rot Disease of Onion, caused by Sclerotium cepivorum. It is unusual for this fungus to attack the plants so late in the season, and we are inclined to think that the trouble is, in the main, due to the overuse of nitrogenous manures. Big Onions are fed heavily and nitrogen is usually given in excess. Such treatment always makes the foliage soft, and, in consequence, the leaf bases are soft, rendering the Onion an easy prey to disease organism. Try the effect of giving rather more basic manure. There is no need to reduce the amount of nitrogen, provided a balance is made by supplying sufficient potash and phosphate. You will, of course, grow the Onions in a different part of the garden another year. Using Cheshunt Compound once during the season would be a good safeguard.

Book on growing vegetables wanted

(G. G.).—"The Cultivation of Vegetables," price 1s. 3d., just published by the Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W. 1. "Vegetable Growing for Amateurs," by H. H. Thomas, price 1s. 9d., obtainable from Messrs. Barr and Sons, 12, King Street, Covent Garden, London; either of the above would be very helpful to you.

FRUIT

Protecting bush fruit from birds

(H. M. E.).—What is known as a fruit cage has been erected in many gardens, and while it has its advantages, it is liable to be brought to the ground with all its supports, even though the latter be of iron, by a heavy fall of snow. We have found the following method to be the most satisfactory. Erect stout supports at intervals of 10 feet, and to each of these fix lengths of stout wire; if these are run both ways you form 10 feet squares, the wires so used being strained to low stumps driven into the ground at each end. Around the sides and to the desired height, fix ¾-inch wire netting, extra wires running from post to post holding this in position, with an extra stake at intervals if necessary. All this is of a permanent nature, and may remain so for several years. Over the top use ¾-inch mesh fish netting, which is quickly fixed and removed. This method admits of birds having access to the plantation during the greater part of the year when they do more good than harm. Should you, however, decide to cover your bushes permanently, there is no reason whatever—other than that given—to prevent you doing so; we advise you, nevertheless, so to erect your sides that portions or sections may be removed when danger to buds or fruits does not exist, in order that birds may gain admittance.

Double-flowered Peach producing fruits

Having had for nine years in exposed position a common double-flowered Peach tree, I was surprised last year by having two good Peaches on same; and this year it has had over 250 fruits on it. Isn't this rather unusual? R. L.

[While not very common, it is by no means unique for the double Peach to produce fruits. It will usually be found that the trees, having pretty well exhausted the soil in which they are growing, have been producing single or at least semi-double flowers, and this may account for them being able to produce fruits.]

MISCELLANEOUS

Horticultural advisers

(E. W. Payne).—Most counties have a Horticultural Expert available for advisory work within the county. The Ministry of Agriculture publish a leaflet—Technical Advice to Farmers—which gives the broad outlines of the scheme. In your case if you write to the Director of Agriculture, Shire Hall, Gloucester, he will no doubt put you in touch with the Horticulturist.

Diseased Grass

(M. S. Knight).—The specimens of diseased grass (Lolium perenne) are affected with a grass-destroying fungus which in the past has had many names, but the fungus concerned is now known as Corticium fuciforme. The disease is widespread in Australia, and also appears from time to time in this country. The control measures which should give you good results are:—Spray the affected portions both now and in the spring with Bordeaux mixture, using 4 lbs. of copper sulphate, 4 lbs. of best lump quicklime, and 40 gallons of water. Follow this treatment by giving a dressing of sulphate of ammonia at the rate of 1 oz. per square yard in April next. We should be glad to hear from you the result of this treatment.

NAMES OF PLANTS

(*Major W., Peeblesshire*).—Pyrus pinnatifida Ehrh. (P. Aucuparia x intermedia). A supposed hybrid occasionally found in woods in England and Scotland, though not recorded from Peeblesshire previously, so far as we know, as it is not mentioned in Mr. F. R. S. Balfour's account of the botany of that county ("History of Peeblesshire," vol. 1, chapter X., page 24), where P. Aucuparia is said to be common throughout the county.

(*W. G. N., Glos.*).—(1) Small-leaved Cratægus orientalis; (2) larger leaves and large fruit; specimen very inadequate, but probably Cratægus coccinea.

Mrs. E. B. L.—Cynoglossum amabile.

Clay.—Dianthus carthusianorum nana.

Mrs. W. H. B., Herefordshire.—Exacum affine.

C. W. L.—1, An Æthionema, but without flowers we cannot say which; 2, Silene maritima; 3, Erodium pelargonifolium; 4, Primula marginata. Kindly note rules for naming plants.

Lilian S. Owen.—Most probably Pyrus Aria var. majestica. Mature fruits are, however, necessary to enable us to name with certainty.

O. M. R.—E. Berberis concinna; F, may be B. vulgaris (no berries); G, B. polyantha; H, may be B. Knightii (no berries); I, B. umbellata; J, Cotoneaster buxifolia; K, Berberis Sargentiana; L, B. vulgaris; M, B. umbellata; N, B. empetriformis O, B. Wilsoni; P, B. stenophylla; Q, may be B. Lycium (no berries); R, B. vulgaris; S, Cotoneaster Simonsii.

NAMES OF FRUITS

H. L. W., Leicestershire.—Pear Admiral Gervais. Dessert. November-January.

S. H. Sheffield.—Apple Rosebery.

R. C. T., Battle.—Apple Tom Putt.

Ignoramus.—1, Queen; 2, Astrachan Red; 3, Mere du Menage; 4, Striped Beefing.

W. B., Carlisle.—Beurré Hardy. Yes, it is one of the characteristics of this goo to have a pink tinge in its white fles you have proved, it is quite one of t and hardiest Pears. In "The Anat Dessert," recently published by Dula author, Mr. E. A. Bunyard, writes:— we omit Beurré Hardy, so soli masculine in its coat of russet and re its *rose-water perfume* and pink flesh?" It is not surprising that yo ployer likes it best of all Pears.

A. H., Hants.—1, Gascoyne's Scar Williams' Favourite; 3, Baumann's R

S. T. S., Catham.—Pears: 1, Catil Uvedale's St. Germain; 3, Clapp's Fav 4, Doyenne du Comice.

H. L. S.—Charles Ross.

T. B. Worton.—Rival.

Regular Reader, Wrexham.—1, Ye core; 2, Yes, Peasgood Nonsuch; 3, F Pippins; 4, James Grieve; 5, B Beauty; 6, Queen. Pear: Mar Marrilat.

A. W. F., Yorks.—1, Rival; 2, Haw den; 3, Newton Wonder; 4, Sturmer

F. W., near Chichester.—Lord Bur

D. R., Barry.—2, Rotten; 3, may b fruit of Bramley; 4, Newton Wonder.

D. M., Omagh.—1, Soft Apple squas post; 2, James Grieve.

Lady M., Ireland.—Apple Dr. Harv

Regular Reader, Brentwood.—1 Very poor, not recognised; 2, Ribston 3, Pear Johnny Mount. [We thin name is a corruption from Jolimont P which is synonymous with Doyenné d' Ed.]

P., Leominster.—1, Ecklinville; 2, ley's Seedling; 3, probably Golden Spir colour later; 4, King of Pippins.

J. H. B., Somerset.—Baumann's Re

Clay.—Pear Brown Beurré.

W. P. W.—A seedling, probably.

H. J. H., Dorset.—Charles Ross.

W. B. Essex.—Pears: 1 and 2, rott Dr. Jules Guyot; 4, Vicar of Winkfiel

Stictite

Safeguards the Fruit Crop

By trapping Winter Moth, etc., Stictite prevents the laying of thousands of eggs which would otherwise hatch out in the Spring and do serious damage to the fruit.

Winter Moth appears early in October so that Stictite should be on the trees without any delay. 1 lb. of Stictite will do 10 to 20 trees according to diameter.

½ lb., **1/6** (post. 6d.); 1 lb., **2/9** (post. 6d.); 2 lbs., **5/-** (post. 9d.); 4 lbs., **10/-** (post. 9d.); 7 lbs., **17/6** (post, 1/-).

Greaseproof Paper, 5 ins. wide:—6 yards, **2d.**; 12 yards, **3d.**; 25 yards, **6d.**; 50 yards, **9d.**; 100 yards, **1/6**; 200 yards, **2/6.**

Write for Descriptive Folder

Stictite is sold by Nurserymen, Seedsmen, Florists, Ironmongers, Chemists, and Stores. If any difficulty, please write to Abol, Limited, 11, Beltring, Paddock Wood, Kent.

A Rock Garden Society

By Sir William Lawrence, Bt.

BERNARD, so he tells us, was in the Alps; for many a day many a night he struggled through crevasses, snow-fields, and he called od to help him. And no help came, was about to renounce his God, when corner where the snow had melted, nd a blue Gentian, and knew God St. Bernard is surely the patron the rock garden. When, in the week of December, Crocus hyemalis its flowers into a cold world, I feel al thrill, for does it not come from em? And to quote from A. Bowles' "Handbook of ": "One likes to think shepherds of Bethlehem to the first Christmas ile resting on a field full of ers of C. hyemalis." Now- he memory of a wonderful on Mont Cenis, in the t Gavarnie, is kept verdant Saxifrage or Ranunculus home in the moist recess onge bag! I remember a honeymoon couple in ey brought back Droseras guiculas, which they grew ral years with great suc- window-boxes at Bicken- ansions, opposite Baker tation. So, you see, an plant is just potted . Most Alpines have g natures; the gardener riend, and their glistening m to say, "Do keep us The wise gardener knows tle ways; he knows the ering form of Potentilla how to feed an ailing us with nodules from he recognises the Kruschen in the plant that hates lime. He hat Celmisia and Clematis seed must with the pappus erect; that while eds only germinate on the surface, equire to be frozen and to thaw out oil.

Rock Garden Society all this garden l become common knowledge; the iding places of Silene, Androsace, , will be laid bare. ("Siste, viator," ay cry, but surely it is up to every to protect its own flora—in y we read "C'est défendu de e chardon bleu!")

one can grow Alpines, and nothing in etable kingdom gives more exquisite . We all want to have the best , and to have our cushions full of pins; to grow Primula Allioni upside down and Jankæa Heldreichii vertically; to know which is the root and which the growth of a Cyclamen tuber—many is the tuber I have planted on its head—to distinguish between sun and shade lovers, and to avoid ninety-nine Composites out of every hundred!

All this and more a Rock Garden Society should give us. Such a Society, in addition, will introduce new plants and new varieties, by publishing check-lists will correct nomenclature, and, above all, will foster that sodality which is the salt of gardening. So we want you all to join the Society, whether your garden is limited to a sink or wanders "through caverns measureless to man."

William Lawrence.

Gentiana corymbifera in a Northumbrian garden, August, 1929

Mimulus cardinalis

This is a thoroughly desirable Alpine plant, and this summer, in spite of the drought, its brilliant scarlet flowers have been one of the brightest features in my rockery. If Mimulus cardinalis is to be seen at its best it must be transplanted in alternate years, and this is a suitable time at which to do the work. The species rejoices in a sunny situation and a moderately rich soil. Leaf-mould and manure mixed provide an excellent compost for working into the pockets of the rock garden when planting is taking place. During spring, when the young growths are emerging from the soil, they are liable to be attacked by slugs and snails. If a cordon of sharp ashes is drawn around each colony these destructive creatures will be kept at bay. G. H. C.

Gentiana corymbifera

In 1924 a New Zealand correspondent sent me some seed of this Gentian. It germinated well, and when the young plants were old enough they were planted out on the rockery in various positions, and in a variety of soils to see what suited them best. Some planted in rather heavy, limy loam did not live long; others put in soil that was rather richer in vegetable matter did better, and some lived to flower; but one that did far away the best was planted in a bed almost all leaf mould in a sunny position that had been prepared for and planted with Gentiana sino-ornata. This plant, every spring, formed a larger and larger rosette of lanceolate bronze-green leaves (which took no harm from spring frosts, but was cut off entirely by the first sharp autumn frost), till this year, when, in July and August, it developed a much branched panicle, about 1 foot high and rather more across, carrying numerous white flowers.

While G. corymbifera cannot be called an aristocrat among the Gentians (unless as representing, with the other New Zealand Gentians, a very ancient form), it has a decided beauty all its own, and its dark-coloured leaves and stems throw out the purity of its white flowers

Cheeseman, in his "Manual of the New Zealand Flora," says:—"Usually perennial, but often dying after flowering." When grown in this country I expect it will be "usually dying after flowering." Like so many New Zealand plants, it is a great seed-bearer, so, unless its capsules are cut off at once, there will be little chance of its surviving for another year.

In contrast to the Gentians of the Northern hemisphere, all those found in New Zealand and the adjacent islands, with one exception, have white flowers, or, in some cases, white flowers streaked or veined with purple or red. They are all much alike. The one exception is G. concinna from the Auckland Islands, which sometimes has flowers all red. Northumbrian.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Daphne rupestris grandiflora

SOME of those who have read Reginald Farrer's delightful account of Daphne rupestris in "The English Rock Garden" may wonder to what heights of his own particular descriptive ecstasy he might have risen had he known that special and distinct form of the plant which is now not uncommon in gardens, and which has received the inevitable grandiflora title.

For in this new form every character in the beautiful type plant is exaggerated and emphasised to a marked degree. The plant itself is more vigorous in growth and more generous in flower, and the leaves are darker and more glossy. The flowers are more than twice as large and of a deeper shade of rose, and I have persuaded myself that the scent is sweeter.

Oddly enough, the introduction of this form into this country was a matter of the merest chance, for the original piece was one of the plants which were collected by the late Mr. Robert Tucker and myself in July, 1914. At the time of collecting it was not in flower, and it was not selected for collection because of any apparent merit. Truth to tell, the acquisition of Daphne rupestris from its stark cliffs is hazardous work, and, if I remember rightly, there was little option as to which plants should be taken and which left.

The plants reached Oxford safely, and were duly established on their own roots.

Then came the war, and it was not till 1919 that I learnt that one of our plants had so distinguished itself.

I have often wondered whether it is merely a varietal form or whether it possesses a strain of some other Daphne, though I do not remember having seen any other member of the family near its habitat.

In this connection, will someone please tell me the history of Daphne arbuscula, which, in this family of aristocrats, shares, I think, the highest honours with Daphne rupestris? NELSON JENKIN.

Trimmer's Field,
Hindhead.

[It is with the greatest pleasure that we publish Dr. Jenkin's account of the discovery of Daphne rupestris grandiflora, and so far as we are aware this is the first time that the history of this fine plant has been recorded.—ED.]

Campanula Raineri alba

In one of our troughs a well-established patch of collected Campanula Raineri gave us about 50 blooms, one of which was the purest white—quite true to type and very charming. Needless to say, future developments will be watched with interest. F. J. COOPER,
Tucker's (Oxford) Ltd.

Eritrichium argenteum

In GARDENING ILLUSTRATED, page 705, a correspondent of Cincinnati inquires about Eritrichium argenteum, and the answer is that there is no information about this. May I inform him that there are two American forms of Eritrichium which are very near to nanum, E. elongatum (See Tidestrom "Flora of Utah and Nevada," page 454) with the dorsal face of the rootlet with a winglike entire margin, and argenteum, with a pectinate margin—but these varieties are only botanic ones, and the aspect of the plant is the same. The Eritrichium in the Rockies and American mountains is very variable. Some bear very large flowers and others very small. The foliage of argenteum is more silky than our E. nanum, hence, perhaps, its specific name.

Geneva. H. CORREVON.

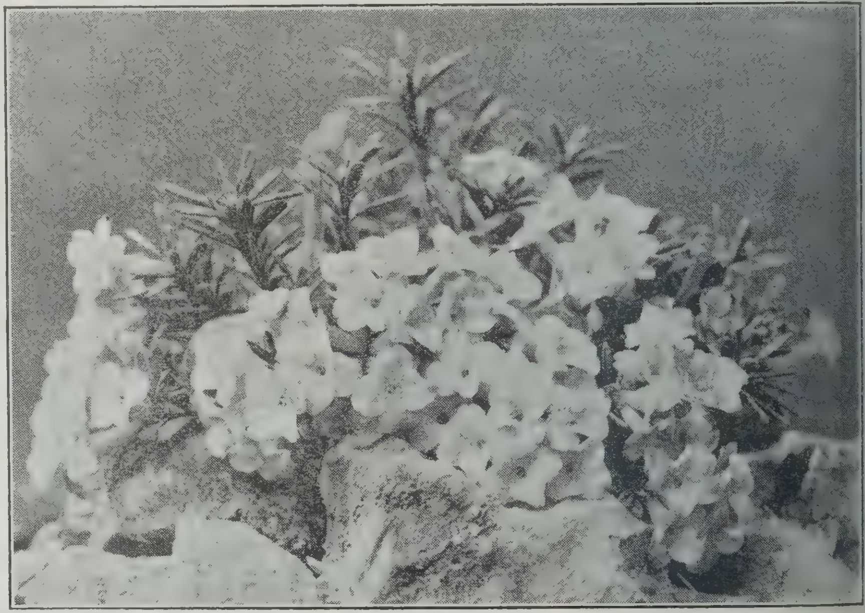
Vine Weevils and damage to Cyclamens

The attack of the weevil amongst Cyclamen appears to be causing more mischief with each year, and the method Mr. Richardson adopts to eradicate this pest (issue October 26th, page 721) may prove a boon to many who are suffering from its ravages.

Whilst preparing the compost for Cyclamens during the summer, I found quite a number of the larvæ embedded in the turf.

Consequently, all the turf used was sterilised and this year there is no sign of the enemy.

Last year they were affected, the ultimate weevil doing nearly as much damage to the flowers as the larvæ did to the roots.



Daphne rupestris grandiflora

Frequent applications of soot water seemed to hold the numbers in check to a certain extent.

I have been informed that this is not the Vine Weevil, but a near relation. Can any reader verify? J. F. H.

Shrewsbury.

The introduction of the Fuchsia

It has been stated recently that the first Fuchsias brought to England were planted in the Earl of Bute's Highcliffe garden. Is this correct?

Fuchsia coccinea was the first Fuchsia brought to England; this is generally admitted. In GARDENING ILLUSTRATED of July 24th, 1880, page 246, there is an account of Mr. Lee, the well-known nurseryman, of Hammersmith, having procured the plant of the first Fuchsia brought to England from "an humble dwelling at Wapping," where he purchased it for ten golden guineas from a sailor's wife. Most of us have known this version more or less since early youth. The authority of the Keeper of Botany at the British Museum of Natural History in verification is as follows:—"Dated May 21st, 1929. Dear Sir,—The Fuchsia was brought
from South America about 1788, by a Ca
Firth. The plant was acquired by a nu
man—Lee, of Hammersmith—by wh
was propagated and distributed. It
named Fuchsia coccinea by the bo

Gladiolus Blackwellii

ıy interest the readers of GARDENING
ATED who saw the illustration of the
d Gladiolus figured on page 741 to
at the species has now been identified
O. Stapf as G. Blackwellii L. Bolus (*cf.* "Annals of the Bolus Herbarium," III., page 77 (1921)). Although described as tender, I am hoping it will thrive with the ordinary treatment given to the garden varieties of Gladioli, viz., by lifting and housing the corms as soon as the foliage withers in the autumn. This, at any rate, is what I did last year with entirely satisfactory results.

The charm of the species lies in the large number of flowers that remain open at the same time—sometimes as many as 20, or even more, pink blossoms may be seen in their prime on the same spike.

G. Blackwellii appears to be a vigorous and strong-growing species. I found it on a steep mountain slope about 20 miles south-west of Port St. John, Pondoland, South Africa. It was not in flower at the time (I gathered the corms in November—which is equivalent to the month of May in the Northern Hemisphere), and I had no idea of the beauty of the plant I was collecting.

Benenden. COLLINGWOOD INGRAM.

Anemone Pulsatilla in a reader's garden

THE Pasque Flower is a most charming Anemone for the Rock Garden. The illustration is of a plant on my rock garden, taken last spring. This was an amateur's first attempt at photographing flowers close up, so it does not do the plant justice. At the time of being taken this plant had over 80 buds and blooms. It is growing on a gentle slope, facing south-east, in a mixture of loam with a little leaf soil, river sand grit, and chalk added. I may be fortunate in living on the edge of the chalk downs on which this plant can be found growing wild, but, so far, I have not yet had the pleasure of finding it. There are several forms of this Anemone, and one very charming form I have is A. Pulsatilla Dykes' Variety, but, so far, with me it does not grow with such vigour as the type. GEO. P. PORTER.

Wantage, Berks.

The Pasque Flower (Anemone Pulsatilla) with over 80 flowers and buds

Cyananthus lobatus

The controversy about the colour of the flower of Cyananthus lobatus seems to show that some people are unable to distinguish the difference between blues described in this case as Gentian blue and a shade of purple which is the colour of the flower of Cyananthus lobatus. Cobalt is a true blue and is the colour of the Gentian flower. Blue may be of any depth, pale or deep, any shade, light or dark, but it cannot tone into another colour, red or pink, however slightly, without changing into a shade of purple. Where this change occurs, as it does in the flower of Cyananthus lobatus and many other flowers, they should never be alluded to as blue. Had the flower been that of Cyananthus Farreri the colour mistake might have been excused. The Old Masters were fond of painting the robes of the Virgin Mary blue. I have heard this colour called Virgin blue, and most of us must be well versed in this very blue—blue which is good enough as a standard for the colour in question. KENNETH McDONALL.

Port Logan, Wigtownshire.

Quality in Pears

Mr. Markham's note on the exceptional quality of many Pears this season reminds one of the highly aromatic—one might almost say, in some instances, peculiarly aromatic—flavour in some varieties which is not acceptable to some palates. There are many of this type, beginning with Williams' Bon Chrétien and continuing through the greater part of the season, and where these are not acceptable it is well to avoid them in planting operations. They remind one somewhat of the Hautbois variety in Strawberries, much appreciated by some and almost disliked by others. I have heard adverse criticisms as to the old autumn Bergamotte, which, to me, is an exceptionally nice little Pear. The very highly-flavoured varieties that one remembers, now seldom met with, were Sickle and Van mons le Clerc; the latter came very large from young trees, and was a fine Pear at its best, but an indifferent keeper, soon becoming mealy. A far later Pear with something in its flavour very good and somewhat unique is Forelle. E. B.

The Hailsham Berry

By those now planting fruit, consideration should be given to the above, and where it has not yet been grown, it should certainly be given a trial.

It is really a fine sized and deeply-coloured Raspberry. Cut down to the ground in February, its fruit is produced in autumn on the young canes, and the fact that to-day (November 1st) I picked a nice dish of it for dessert is surely a recommendation, as soft fruits are now scarce or nil. Grown in the private garden, a rather sheltered spot should be chosen, and it will there continue to ripen and pass unharmed through slight frosts. I can never understand why it is not more freely grown for market; it should surely command a ready sale in the shops.

Rye. F. HERBERT CHAPMAN.

Some effects of the drought

An allotment holder who had just lifted his crop of Mangold Wurtzel complained bitterly of the difficulty experienced in doing so. "In most seasons," he said, "they come up easily enough, but this year it is a job to get them out." "They have delved down," I said, "in the search for moisture." And the same thing is experienced when one is shifting some hardy flowers. The roots have certainly gone down much deeper than is usually the case. The soil below is terribly dry, and it will necessitate clearing out and substituting fresh before replanting, or when young plants have to be transferred from seed-bed to new quarters. In a bit of spare ground, where a few plants of different things were put out with a view to taking some seed, the very dry time was responsible for the development of seed pods before one was hardly aware of it, and the seedlings are coming up in thousands. There will certainly be no lack of plants to fill in any vacant places. E. B.

Looking for Wulfenia Baldacii

By Dr. P. Giuseppi

In 1897 Professor Baldacii, of Bologna, discovered this interesting plant on Maja Sterbits, a mountain to the north-east of Scutari.

In 1916 J. Dörfler discovered the plant on the southern slopes of Chafa Stogut, one of the same group of mountains, and in 1928 Markgraf again found the plant.

The interest of this plant lies in the fact that the only three Wulfenias previously known were Wulfenia Amherstiana, which is found in the Himalayas, Wulfenia Carinthiaca, found in small numbers between 1,600 metres to 2,300 metres over a large area in south-east Europe, comprising Montenegro, Novi Pazar, Albania, and South Carinthia. The furthest south that Wulfenia Carinthiaca has been found is on Kopravnik, a mountain to the west of Petch, in Yugo Slavia. My wife was lucky enough to find the only two plants found by us on this mountain. Finally, Wulfenia orientalis from North Syria. It has been held by botanists that these four plants are the survivors of a flower that once spread over a large mountain area extending from the Balkans, through the Caucasus and the mountains of Persia, to the Himalayas.

Shoti tribe

Wulfenia Baldacii has only been found in the group of Albanian mountains to the north-east of Scutari, and only between 1,600 metres and 2,000 metres in height.

Professor Baldacii found only some five plants on Maja Sterbits, and it has always been thought to be a very rare plant.

The difficulty in finding it has been, without doubt, the difficulty and danger of travelling in Albania.

It would be extremely interesting to discover on what mountain in the North Albanian Alps the Wulfenias meet.

The day we left Scutari was extremely hot, and both to my companion, Mr. Ingwersen, and myself riding was anything but a pleasure.

We took with us a tent, sleeping bags, and various articles of tinned food and bread, and it was fortunate for us that we did so, because the only things we were able to purchase during our trip were three eggs.

We travelled at first over an uninteresting plain, and then over low hills, which are rapidly being washed away because of the deforestation, which is even now progressing. In one spot along a narrow ridge the path had been gradually deepened by the rain until it formed a miniature gorge, and in it our pack-horse stuck and badly cut its knees. It took us a considerable time to unload the unfortunate animal and, after leading it out of the hollow, to reload it. Finally, after an extremely tiring day our guide, who could speak but few words of Italian, announced at 8.30 p.m. that we had arrived at a suitable camping place. By this time it was so dark that we were compelled to accept his advice without being able to judge for ourselves.

Putting up our tent in the dark was extremely difficult, but at last we sat down to a well-earned cup of tea, brandy, and potted meat and bread. Our first day in the Albanian Alps had taught us how very steep the hills were, and, secondly, how uninteresting the flora of the foothills was.

Next day we left our camp at 7.30 a.m., and made for Mount Tsukali. We met a large party of Albanians returning from marketing in Scutari. They consisted of men and women of all ages, and apparently untirable. They slept by the wayside at nights, and the large party straggled on, to reunite only at midday and at night. They were extremely friendly, and a very happy family to watch. The young men and women made love quite openly, sitting holding hands and embracing each other in the time-honoured way.

Their food appeared to be bread and Cucumber. Each man seemed able to eat a whole Cucumber with ease.

They are a fine upstanding race of medium height, and are able to walk for days on end without tiring. Their gait is a slouchy one, but very effective. The country is well wooded with Beech right up to Tsukali. Here we found large numbers of Crocus Heuffelianus. After leaving the summit of Tsukali, we made in a north-westerly direction over paths that had been used so seldom that riding was impossible, and we were compelled to lead our horses through the dense thickets until we came out at the top of a precipice of 3,000 feet. From the top we had a wonderful view of the snowclad peaks of Shala. We found here large quantities of Ramondia Serbica, growing on limestone crags, and a Sempervivum. We descended an extremely steep path, and in a natural moraine we found masses of Saxifraga Grisebachii,
growing in the full sun on chips of limest

ock garden making in New Zealand

lemonstration of how to build a model
garden was given recently by Mr. A.
nson, a member of the New Zealand
e and Rock Garden Society. About 150
e took a great interest in the lesson and
ntly learned a great deal.

. Wilkinson prefaced his work with a
talk upon the Society, and the correct
dure to adopt in the establishment of a
garden. He said that the New Zealand
e and Rock Garden Society was formed
lson some six years ago, and had mem-
in every portion of the Dominion. Its
t was to give assistance to members not
in the actual construction of the rock
n, but also in the procuring of suitable
s. The cultivated families of rock and
e plants, he said, formed a wonderful
l of colour and variety, from which it
not to be expected that the newcomer to rock gardening could pick and choose to advantage without the aid of someone who knew the characteristics of the host of different kinds. The work of the Society was to give these newcomers assistance in their choice of plants.

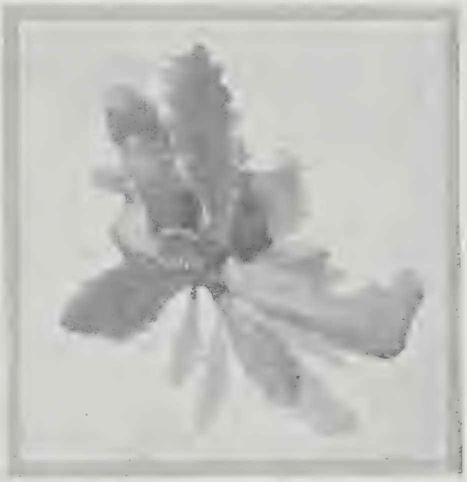
The first essentials to success in the cultivation of Alpine plants were quick drainage, an open situation, and a clean surface to the ground, these being necessary so that the plants could adapt themselves to their new situations.

Mr. Wilkinson expressed the opinion that Napier, N.Z., was exceptionally favoured for this form of horticulture in that there was an abundant supply of suitable rocks and many banks which could be transformed from a disfigurement to a property into a thing of beauty. Explaining the system upon which the rock garden was built, Mr. Wilkinson said that it was necessary to build so that every plant could be reached either by steps or paths, and so that all plants could get the benefit of the rocks and moisture. This could be obtained only by building the soil into the form of pockets, by which he meant an irregular series of small terraces hemmed in by the rocks. No matter how steep the bank might be, it was possible to have every inch of soil on the flat, and so able to receive and retain the moisture.

The Mayor, Mr. J. V. Brown, was then called upon to lay the first stone in position, after which Mr. Wilkinson, assisted by Mr. C. Corner, the Borough Council's head gardener, and two of the assistant gardeners, proceeded with the erection of what was called the corner of a rock garden. The various stages of the work were watched with keen interest by those present, and it was quite evident that the acceptance of the pressing invitation made to Mr. Wilkinson by many Napier citizens to give the demonstration should be of great benefit to those desirous of improving their gardens by such work.

It is the intention of the Napier Borough Council to plant the small model rock garden with special plants, each one to be labelled with its name so that those interested in Alpine plants can become acquainted with any special variety.

Wulfenia carinthiaca



Wulfenia Baldacii

Albanian Moslems

From photographs taken by Dr. Giuseppi

Daphne alpina

This fragrant species is somewhat rare, despite the fact that it was introduced from the European Alps so long ago as 1759. The small white flowers, deliciously if faintly perfumed, are freely produced, and last well into the autumn; the plant grows about 2 feet high, is perfectly hardy, and is a most desirable low shrub for the rock garden. I recently saw this Daphne doing well in a well-drained loam soil high upon the rock garden and in a very exposed situation; it is not so showy as are some of its order, but it is a plant of considerable beauty, and one of unquestionable value for the late summer and early autumn months. What lovely Daphnes are there! The beautiful ivory-white Blagayana, the exquisite rupestris, the fine old indica, and the pretty Garland Flower, D. Cneorum; with a little attention paid to their individual requirements, their gifts are freely bestowed, except that rupestris is sometimes a little wayward. RALPH E. ARNOLD.

Muscari polyanthum

Few of the species of the Muscari, or Grape Hyacinth, are well represented in gardens, and of late that wonderfully brilliant one called Heavenly Blue seems to have largely monopolised the attention of those who are purchasing any of the Muscaris. I would suggest that those who care for the genus might think of a few bulbs of M. polyanthum, a species with larger flowers and of rather taller growth. It is a good blue, and a fair-sized group in the rock garden or front of the border, or in grass, is quite pleasing. For those who like rarer bulbs there is also a white variety of M. polyanthum, M. polyanthum album, which is much finer than the white variety of the common Grape Hyacinth, M. botryoides album. I like to plant these Muscaris as soon as they are received from the dealers. S. ARNOTT.

Why Make a Rock Garden?

THERE is, or used to be, an odd belief in England that the French were a frivolous and light-minded people. Even more odd and erroneous was the belief held in France that the English were *toujour pratique*—a race immune from the weakness of sentiment and romance. Yet the English spend more on rock gardens than any other nation, and it is difficult to imagine anything less practical—more sentimental if you like—than transporting truckloads of limestone from Westmorland to the home counties and trying to make from them a more or less realistic home for the reluctant flora of the high Alps.

But rock gardening, although it is so English, is beginning to spread to other countries, for it is a curious fact that the English, for the last 100 years, have set the fashion in recreation for the whole of the civilised world. So rock gardening must be something more than a national eccentricity, like turning up the trousers or driving on the left of the road, and it seems as though we have been the first to become aware of a universal need and to give expression to it. This supposition seems more plausible when we note that rock gardening is closely associated with another fashion, that of going to the mountains for a holiday, which was initiated in this country and has spread very rapidly.

The holiday in the mountains is, fairly obviously, a reaction against the conditions of civilised life, and it is natural that the English, the most romantic nation in the world and practical only in their aptitude for giving a concrete expression to their day-dreams, should be the first to look back, with a kind of sentimental nostalgia, to the wilderness from which civilised man has at last succeeded in escaping.

This illogical distaste for what we have ourselves laboriously created may be the result of a deep, unconscious rebellion. For a holiday in the mountains is a flight from reality, it is an escape from that oppressive reality of which we make the regularity of bricks and mortar the symbol, and in the mountains we enjoy, for a little while, an illusion of that freedom which we can never attain in this world. In the rock garden we foster a little patch of the wilderness that stands to us for freedom. And this is a very sensible thing to do, for an artificial wilderness has none of the discomfort and danger of the real thing.

Such a game of make-believe may be sentimental; it may be just a way of saying, "Where I am not, there is happiness," but if it is wildness we are after let us see clearly what we want. For a rock garden the size of a tea-tray can be made as effectively wild as an acre. This is not a depreciation of the Alpine landscapes fashioned on a large scale by our expert designers of rock gardens. These are the well-nigh perfect expression of that desire which is inarticulate in the haphazard rockery of flints, brickbats, and Aubrietia. But we need not look on their creations with helpless envy, for we can learn as much from them as any scribbling journalist can learn from the masters of English prose, and with more hope of putting what we have learnt successfully into practice. We need not feel that rock gardens are out of place in the suburbs, for it is there that they are most desired, and I think that anyone who has as much as a backyard can make an Alpine landscape if he has the courage of his imagination and is willing to learn the technique.

JASON HILL.

Campanula Miss Willmott, variously referred to as C. C. Bellardii, cæspitosa and pusilla, originally found near the Rhone Glacier

It has masses of pretty pale silvery blue flowers

Annuals that *are* satisfactory

There is no doubt that whether the flower garden be on a large or small scale a very fine display can be obtained all through the summer months by the use of annuals. One can have them in heights varying from a few inches to 3 feet or 4 feet and in an endless variety of colour. In making the selection it is well to remember not to include those things that are comparatively short-lived as it is not pleasant to have a collapse about half-way through the summer,
the consequent necessity of finding
material to fill the beds. The most sat
tory things in this difficult year have
the many different types of the Marigol
Nasturtium families, Cornflowers,
Zinnias. When using annuals on
a large scale it is advisable to allot a
fair stretch of border to one species, an
to provide a few foliage plants that
raised from seed, like Acacia Lopha
Grevillea robusta, or one or two o
Eucalyptus.

The silvery foliage of the Eucal
shows to advantage against the
striking, and gorgeous colours as
sented by plants like the Celosias and
glossis. These are among the most str
of our summer-flowering annuals, an
always attractive, but they have been
short-lived this year. Some of the fa
may have a considerable space devot
them, such as Marigolds, represented
many different heights, and Nasturt
or Tropæolums. In the latter case if
pyramids of twigs are placed in the gr
at intervals the plants make their way
them and make a pleasing change a
the dwarfer plants. The double
variety shows to the best advantage
raised a bit above the ground. It is w
note the results of all planting whe
flower, especially of any new ann
although it is difficult to form an acc
judgment as to what any plant is capab
doing in a season like the past. E.

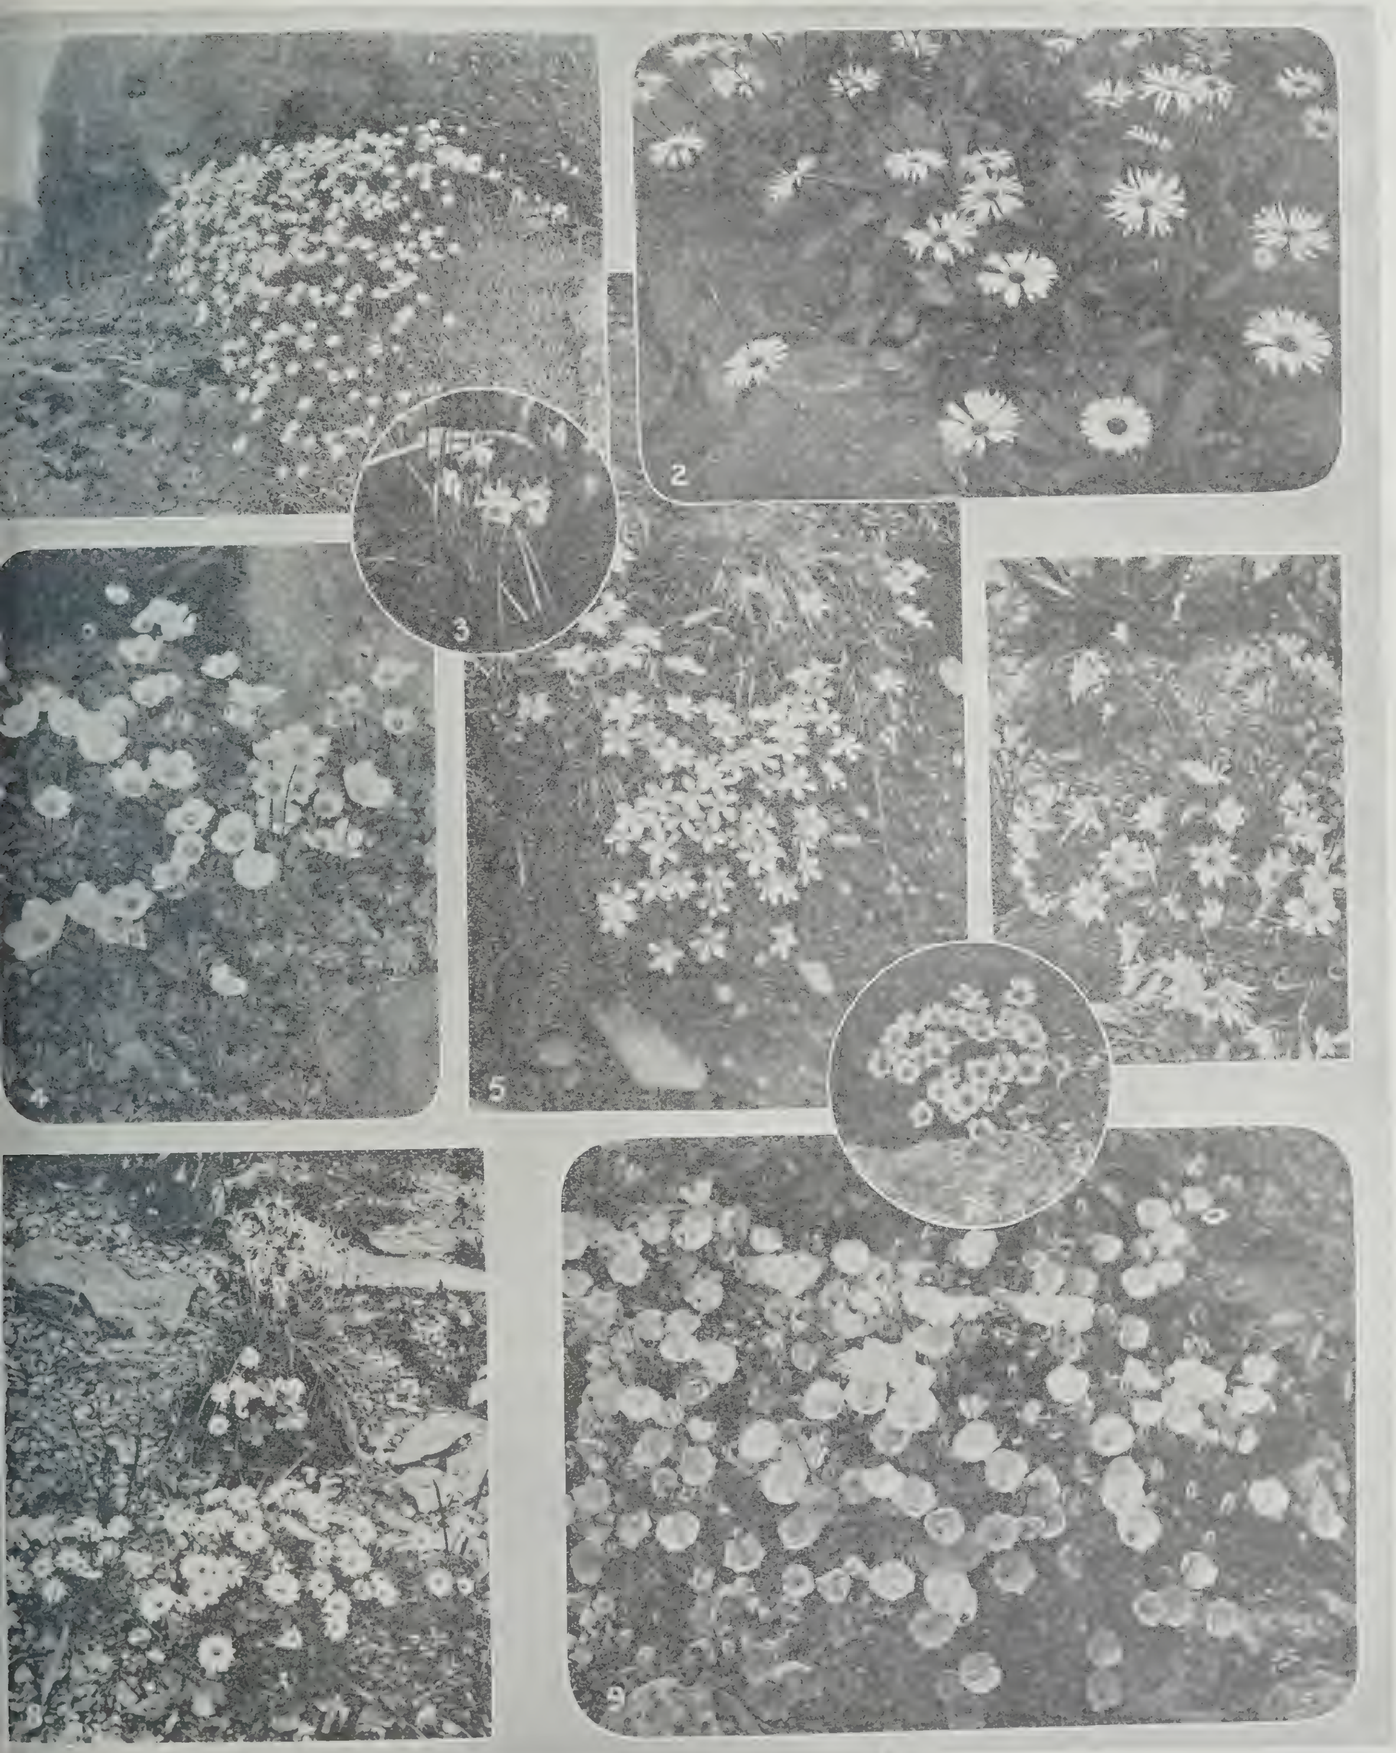
Campanula Bellardii Miss Willmott

HAVING a spare plant or two of
charming little Campanula Bell
Miss Willmott, I thought I w
plant it in a moraine to test whethe
would do better there than in the rock
den. The result is that this moraine-g
plant is much finer than those in the
garden, or even those growing in a re
ing wall. It was literally covered with flo
and not a leaf was to be seen, while it
grown into a more bush-like plant. I co
that I like the form of the flowers of
Miss Willmott better than those of the p
lar C. B. Miranda. I think Farrer c
the blooms of C. B. Miranda "of enorm
size," and they are certainly large comp
with other forms of C. Bellardii,
as another writer has since said, they
"tubby" in form, those of C. B. Miss W
mott being the better shape. I may add
the latter is growing apace in the moraine
will soon cover a good space, and that it l
well against the grey whinstone chips w
surface the moraine. S. ARNOT

Escallonia montevidensis

This is not a new shrub, as it was in
duced from New Grenada so long ago
1827, but it has never become plentiful
gardens, or not nearly so much as its m
deserve. It is distinct from others of
race, and will make a shrub of apprecia
size, well-furnished with glossy green lea
and covered from August to November w
panicles of pure white flowers. It is
sufficiently hardy to plant in the co
districts, but is tolerably so elsewhere,
has done well in the London district; i
most satisfactory in a border at the base
wall or near the house, where its hands
evergreen foliage will prove ever ornamen
and its late blooming qualities will be hig
appreciated. Cuttings root easily, and
montevidensis, sometimes called E. fl
bunda, is a shrub of quick growth, e
though it will cover itself with flowers w
in quite a small state. RALPH E. ARNOLD

WHY WE LOVE ROCK GARDENS



SOME GEMS AMONG ALPINE FLOWERS THAT APPEAL TO ALL

ianthus plumarius, a shower of pink flowers on limestone rock.

elmesia Munroi with large white Daisy-like flowers from the mountains of New Zealand.

arcissus juncifolius, the miniature Rush-leaved Daffodil, flowers rich yellow. Native of the high Pyrenees.

ne Snowdrop Anemone A. sylvestris, with large white nodding flowers.

5. Gentiana verna by the roadside in the Pyrenees. It stars the Alpine meadows in untold thousands with the most vivid blue in Nature.

6. Lewisia Howellii on a well-drained rocky ledge. Flowers apricot, with deep salmon-coloured band to each flower.

7. Saxifraga Burseriana, a compact, dense grey cushion with chubby white flowers on red stems.

8. Anemone apennina blanda, the earliest of all blue Wood Anemones.

9. Campanula turbinata, rich purple, free flowering.

Notes from Floraire

GENTIANS.—This last summer I was fortunate enough to find in the high Cevennes that curious G. Pneumonanthe named Arvernensis by Mr. Backhouse.*

This is a very dear little plant indeed, and nearer to the fine Froehlichii than to Pneumonanthe. Its flowers are in clusters on 5-inch to 6-inch high stems. The cup is rather large and has a swollen flower of deep azure. It grows not in marshes or bogs, but on fresh, exposed grassy slopes. The G. Froehlichii, from the high Alps of south-east Austria, is one of the beauties of these very rich countries. It grows between the grass, and its clear blue flowers are isolated on 1-inch to 3-inch high stems. It is certainly one of the best of all the Gentians, and is of rather easy culture. It only wants a porous soil and fresh situation. It does well in sandy loam.

The best of all for the gardens is certainly the beautiful G. angustifolia (sabauda, occidentalis), which was, according to Paxton, introduced in England in 1816, and perhaps gave the type to the English Gentianella. I suppose this because of the stoloniferous character of the English plant, which is the same as the angustifolia. This is a very curious thing to state, the plant making large tufts of light green, shining foliage all along the roads of the high Dauphiné, forming sometimes—as I saw at the foot of the Mt. Aiguille—3 feet broad patches covered with celestian blue flowers. That stoloniferous character is special to the two types, angustifolia and alpina.

G. angustifolia of Villars (not to be confounded with angustifolia of Michaux, a U.S. plant) is to be recommended for borders, rockeries, walls, and can be considered as the easiest of all. Here, in our continental climates, we cannot grow the other Acaulis as well. It flowers in the spring and again in the fall, and sometimes the whole summer, as it does on our mountain garden at La Chèvrerie, on the Jura. The flower is much larger than Acaulis and of a pure blue marked on the throat by five bright green spots. It cannot be considered as stemless, then, its stem reaches sometimes 4 inches to 6 inches. That flower is elegantly shaped and always very abundant on the tuft.

It germinates rather freely, and we raise thousands of it with the greatest ease from seed.

DWARF CREEPERS.—We grow here two Liliputian South European plants which are not known in gardens and on which I will draw the attention of the Alpine gardeners. Iberis pygmæa or Ventosicola is a dear little gem we found once on the Provence Hills growing among the stone masses on very sunny, exposed corners and on very meagre soils. We brought it home and thought it was only a local form of Iberis saxatilis. But after many years' culture it keeps its character as a very dwarf, creeping Candytuft, not exceeding 1 inch high, covered with very narrow, hard, and greyish leaves, and forming broad tufts of these very tiny plants covering over the soil. The flowers are numerous, pure white or pinkish, and come all the winter and till end of May. We grow both the type and this one together, and the difference can be seen at first sight. Another very dwarf creeper is Globularia pygmæa we found on large rocks in the Alpes-Maritimes. Its broadly expansed masses never exceed 1 inch in height, and the very small, tiny leaves are much thicker and harder than those of nana. The minute heads of blue flowers are borne through the summer and give the carpet of greyish-green foliage a curious appearance of a light veil.

These two meridionals are very hard and are resistant to drought and sun. They are precious for walks, plantations, and rockeries.

Geneva. H. CORREVON.

Junipers for the rock garden

At the R.H.S. exhibition of autumn-berried shrubs and flowers, there were two Junipers of great interest to lovers of rock plants. They were Juniperus squamata Meyeri and J. Japonica var. Pfitzerina. J. hibernica compressa is well known as an object of interest, especially when from 18 inches to 30 inches in height. Propagated correctly, its columnar form, tapering to a single leader at the top, gives great charm to a vista in the rock garden. There is another taller variety, rather rare, J. Icelandica, also known as Scandinavica. It is not so blue-green and close as hibernica, but it can attain a height of 9 feet or 10 feet. At Abington, near the source of the Clyde in Lanarkshire, there is a magnificent specimen at the mouth of the Glengona Burn in the keeper's cottage garden. About 10 feet high and 4 feet or 5 feet through, this is surely one of the finest specimens of its kind in the Kingdom. In two other cottage gardens in the village are two beautiful specimens about 7 feet in height. Abington is 900 feet above sea-level, and these two specimens must be nearly 50 years old.

J. squamata Meyeri is also column
form, although the specimen exhibited
R.H.S. was branched and bushy as it ha
its leaders twice. It is a very rare pla
great grace in outline, attracting insta
tention. It is a perfect Conifer for the s
of the rock garden, especially if planted

Darwins are opening their lovely petals bor

Gentiana sino-ornata in Dr. Jenkin's Garden at Hindhead

From photographs taken on October 20th

Trumpet-shaped flowers of brilliant azure blue, braving the frost, wind, and rain with amazing hardihood from October even into December.

The flowers were so packed together, that on a sunny morning, when the blooms were fully expanded, it would seem virtually impossible to put a pin between them.

When we first saw this glorious bed of Gentians we were moved to silent worship for what is, indeed, one of the most beautiful flowers in cultivation.

This introduction from China is grown in a bed of peat and leaf-mould, and grows like a weed.

out stems, the leaves surrounded by deep Forget-me-nots or clusters of that est of spring flowers, Asperula. Properly ght out and arranged beforehand, one have a great variety of colour in rden at that time. In Darwins alone are many that enhance a garden when oom, such, for example, as Clara Butt rose pink), Mr. Farncombe Sanders let), Pride of Haarlem (cherry red), Rev. ank (heliotrope), Bartigon (crimson car-), and if one is disposed to add a few of Rembrandt type of Tulips, with their nt featherings, the show will be com-. Other things bring a treasury of ur in the late spring, such as hardy ulas, multi-coloured Primroses and lanthuses, blood-red and white Daisies, clumps of Thrift about the edgings of ers that tell in the time of the opening heir flowers that summer days are not ff.

one who has a garden should let the ent opportunity go by in planting something that will make it all the brighter; something that one may follow the progress of the as they begin to lengthen, and watch he opening of their blossoms in the sun- of spring. W. F.

Dividing large plants

most any plant, however large, may be sy divided by driving two digging forks, laid back to back, down through the centre and levering outwards. This is very necessary in many instances every few years, and amply repays doing. Large clumps of Heleniums, Torch Lilies, Pampas Grasses, Michaelmas Daisies, and Phlox should be freely divided up and replanted if the best results are to be obtained.

Bulbous plants for the rock garden

If we utilise bulbous plants for our rock gardens we must exercise proper care in their selection and planting as well as choosing suitable positions. These little gems never look more charming than when planted in irregular-shaped colonies. Another good way is to place them here and there in a carpet of low-growing plants above which their flowers would be seen in early spring.

The kinds named below will thrive with a modicum of shelter from cold winds in nearly all districts, such protection being desirable for the preservation of the flowers, not because the plants themselves are tender. Of Narcissi alone there are four eminently suited for the rock garden—Moschatus of Haworth, which has for its popular name the snowy-white Daffodil of the Pyrenees, the dainty little Minimus, Pallidus præcox, and Cyclamineus. All are of lowly stature and quite in place in the best rock gardens. If a taller Daffodil can be admitted use N. Bulbocodium. It grows about 9 inches high and is a most exquisite flower. There are several spring-flowering Crocuses admirably adapted for our purpose. Susianus and Sieberi are two that come to mind, though there are many others that could be brought into use. For a damp bay the Snake's-head Fritillary (Fritillaria Meleagris) and the Meadow Saxifrage (Saxifraga granulata) are quaint and beautiful flowers that lose none of their charm by being natives in some parts of England. There is a double variety of the Meadow Saxifrage about twice the size of the common plant. Chionodoxa Luciliæ is a perfect gem.

The little bulbous Iris reticulata is well known as one of the finest of early flowering plants. Tecophilæa cyanocrocus (the Chilian Crocus) and its allies, the Sternbergias, Calochortus venustus, the beautiful Butterfly Tulip, Puschkinia libanotica, Ixiolerions, with Zephyranthes candicans are a few of the many kinds that may be introduced to the rock garden without fear of marring its beauty or doing any appreciable injury to other occupants. H. STEVENS.

Gladiolus Blackwellii

The Gladiolus which received an Award of Merit on October 23rd, when shown as an unnamed species from Pondoland by Mr. Collingwood Ingram, has now been identified by Dr. O. Stapf as Gladiolus Blackwellii L. Bolus. This remarkable Gladiolus, with 30 flowers on a spike, was illustrated on page 741 in last week's issue. See also note on page 753.

Gardening in West Somerset

THE deep glossy green foliage of Escallonia macrantha and the thick impenetrable growth, make it both a beautiful and useful hedge shrub, especially in mild maritime districts. Neither is it a shy bloomer. A hedge in my garden has flowered intermittently since June. Here, in the west, this Escallonia needs cutting twice a year to keep it within bounds. The severe weather of last winter killed a lot of the foliage, but by early summer the hedge was as green again as ever.

Among drought-resisting perennials Linaria purpurea is worth making a note of. The primary spikes of purple blossoms were cut back in July when they were getting past, and the display was prolonged throughout August by the numerous lateral shoots. This plant produces self-sown seedlings very freely. A couple or three good plants will provide enough seedlings to stock a decent sized border in two or three seasons. In a very dry part of the garden where Phloxes and other perennials were suffering from drought this Linaria showed no signs of distress. Linaria alpina is also a free seeder, and plants have a way of appearing in most unexpected places. A couple of fine seedlings of Buddleia variabilis appeared in my kitchen garden, evidently the progeny of a bush in my neighbour's garden. It is a good example of the facility with which some shrubs will propagate themselves in western counties. Seedlings of Solanum jasminoides also appeared last spring, some distance away from the parent plant. Passers-by who are not familiar with this beautiful climber allude to is as a Jasmine when flowering, which indicates that the specific name is an apt one.

One of the prettiest pictures in the garden is that of a Rowan tree laden with bright coral-red berries. One regrets that the birds are so fond of these attractive fruits, as they would be a special delight if only they would spare them until the winter. The annual Scabious has done remarkably well this year in spite of the dry season. The wiry stems make them good cutting flowers, and, of course, the season is greatly prolonged by cutting the flowers frequently. There are wonderful colours among them, ranging from bright rose to deep crimson and from lilac to a purplish-black. A bed of Scabious with white Marguerites is very effective. Those who would like a really gay bed next summer should make a note of the following combination which I noticed in a garden weeks ago. Lobelia cardinalis Queen Victoria, Viola Blue Gown, and Centaurea candidissima. The Lobelias were planted about 2 feet apart with the Violas in between and the Centaurea round the edge. Another pretty bed I saw was planted with Lobelia cardinalis among a groundwork of silver-leaved Geraniums, round which was a band of blue bedding Lobelia and an edging of Golden Feather. The entries in a gardener's note-book should consist largely of the colour schemes he has noticed in the course of the flowering season, as it is so easy to forget some of the impressions that are only mentally noted. Of course, many of the most pleasing combinations that one sees even in one's own garden have been accidentally achieved, and carefully made notes of these are of great value when the time arrives for the planning of garden effects.

H. GREAVES.

Cercidiphyllum japonicum

IN this year of indifferent autumn colour it has been interesting to observe the behaviour of this shrub, or, rather, tree, as it grows 70 feet to 100 feet tall in Japan. Individual trees have varied very much in my garden. One of them, planted close to the water, has been particularly fine. Most of the leaves were crimson as early as August 28th, were at their best about September 10th, and were still making quite a brave show on October 24th—almost two months of lovely autumn colour.

Cercidiphyllum japonicum

The foliage assumes rich autumnal colourings

Other specimens are much more fleeting. One, planted not 10 yards from the last named, hardly coloured at all, while a group of half a dozen growing higher up the rock garden, but also close to the water, were not at their best till about October 10th, and were then very beautiful in various shades of pink, yellow, green, and orange. These shed all their leaves in about 10 days.

Another tree, also near water, which most years is particularly brilliant, did not begin to colour till about October 24th, and is evidently not going to make any show. There is no doubt that with me this tree likes moisture, as, without it, the leaves are only half their proper size, and there is very little autumn colour. Let no one, however, be deterred from planting the Cercidiphyllum because they do not happen to have a stream running through their garden, because I have seen specimens colouring finely in situations quite away from water, though never, I think, in very dry positions.

At its best, there is probably nothing to beat this tree, though Nyssa sylvatica, Parrotia persica, Fothergilla monticola, some of the Maples run it close.

The young leaves in spring are also beautiful, but are sometimes blackened late frosts. They soon recover, however, their autumn colouring is not affected.

MARK FENWIC

Abbotswood, Stow-on-the-Wold.

The Gate House, Eskdale

I AM sitting on the bank of the River which flows through some of the beautiful scenery in England. The C brian Mountains run close to the river. deed, the shadows of some of them thrown into the water itself. It is a spot for meditation, and I have taken pen in hand to jot down a few impress of the gardens at the Gate House, Esk Green. Here the sympathies of the ow Mrs. Rea, and the gardener, Mr. Rainb are one, and for 20 years they have labou together for the purpose of forming on the most beautiful gardens it has been pleasure to see. The house itself, a c paratively modern structure built in a so what austere style, is situated but a few away from an extensive tarn. A long bo flanks the mansion itself, and this is fi principally with the Geranium Paul Cr pel, the scarlet colour of which se brighter than usual in this rarefied air. scending a terrace at the front of the ho I noticed an extensive array of Galto candicans, and I have never realised beautiful this flower could be. In the wa of the tarn itself Mr. Rainbow plan colonies of yellow and white Nymphæas so years ago. They have spread enormou since then, and now cover a good shee water. A winding woodland road along side of the tarn leads one to the rock gard which is an almost perfect replica of nat herself. The rock garden was construc some years ago by Messrs. Mawson Broth of Windermere. They made excellent use a stream of water which emptied into tarn from the fells. Here and there water has been dammed, and in the sto around some very choice Alpine subjects to be seen. I was struck by the beauty the Gentians, Spiræas, and various Compa las, and there was evidence that the Sa frages, Androsaces, and Aubrietias had a good time. Here and there throughout garden were some splendid specimens Hydrangea paniculata, and various Bambo The latter are perfectly hardy in this nor ern but genial clime. From the rock g den Mr. Rainbow conducted me to Japanese garden, which was some distan away. The journey there was about pleasant as any man could conceive, and I not wonder that William Wordsworth, w lived in these parts, should write such quisite poems on Nature. In the woodlan which we traversed were some fine exampl of Larch, Norway Spruce, Douglas Fir, La son's Cypress, Retinispora, green and copp Beeches, and an occasional Tulip-tree. T Japanese garden, which is the work of M Rainbow, is situated in the cleft of a woo land. Many tons of stone have been us to give shelter wherever shelter is neede and these have been clothed with approp ate vegetation. The scene within the gard appears to be typically Japanese. There a shelters and bridges built in suitable sty and at various points in the garden Japane birds and figures are disposed, with hier glyphics on them that no Westerner can d cipher. It is natural that the genus Berber should be well represented, and I was pleas to note that several of the late Mr. Regina Farrer's introductions were there. The fol age was just turning to its autumn tints, an the berries were going scarlet. As I looke

m I did not wonder that they were

Alstromerias in masses

trömerias, or Peruvian Lilies, as they
alled, belong to the Amaryllis order,
contains so many beautiful genera. Of
years they seem to have been slightly
garded for some reason or other. They
namental and showy plants, with tuber-
oots and leafy stems, which terminate
nbels of richly coloured flowers. The
er in general cultivation is not large.
al are hardy throughout the country, but
s need protection when grown outside
g the winter, or require to be grown in-
. Few plants, however, need less
tion to grow them successfully, once a
ble site and soil is ensured. A deep,
manured, light, well-drained soil and a
y situation is desirable. They are ex-
ly effective in masses. Propagation is
ed by seed or root division. Seed is best
as soon as ripe in a cool house or frame,
the seedlings grown on till well estab-
l under glass. Later, they may be
ed outside, about 1 foot apart. The
s, which are fasciculated masses of
roots, are readily separated into single
ns during the autumn, but the operation
d be done very carefully. Alströmerias
ery impatient of root disturbance, and
the sites or stations have been prepared
he tubers planted, they should be left un-
rbed for years. Except for purposes of
ase, the less they are disturbed the better. Grown in masses they are very beautiful, as every stem furnishes a large number of flowers, showy and attractive, which last long in water when cut. When making growth they should not be allowed to suffer for lack of water,

The under noted are a few amongst the number in general cultivation :—A. aurantiaca, a vigorous-growing species from Chili. 2½ feet to 3 feet high, with large orange-yellow flowers, streaked red, in umbels of 10 to 15 blooms. This species also does well in a damp situation. There are a number of varieties, varying in colour and size of the flowers. A. Chilensis is another species from Chili, a hardy kind with many varieties, in a wide range of colours from almost white to deep orange and red, height about 2 feet. A. pelegrina, a somewhat tender species, not so tall as the preceding. The flowers are large, whitish, striped with rose, and veined with purple. There are several varieties, including a white one. A. p. Alba, said to be the most chaste of all the Alströmerias. It requires a specially warm spot, or the protection of glass. It is called the Lily of the Incas. A. psittacina, the Parrot Flower, is a distinct kind, with red and green flowers, spotted purple; grows about 2 feet.

There are, of course, many others, but the above suffices to show the variation in colour and usefulness. Autumn is undoubtedly the best time to plant the tubers, with a view to forming new colonies. These should be placed 6 inches to 9 inches below the surface, and protected with litter or leaves the first winter.

J. L.

Early autumn in Mr Mark Fenwick's garden at Abbotswood, Stow-on-the-Wold, Gloucestershire

REMINDERS FOR THE WEEK

Southern and Midland

Primulas, Cyclamens, and Cinerarias

These plants are no longer safe in cold frames or unheated pits, and should be transferred forthwith to a cool house, which may be heated slightly during the night. Unless it is desirable to hasten the two former into bloom, heat of an artificial nature should be curtailed as much as possible with safety, air being freely admitted to check damping of the foliage on all favourable occasions.

Chrysanthemums

These are now at the height of their beauty, especially those producing large blooms, and although a little warmth through the pipes at night is advisable, it must not be overdone. Air freely on favourable occasions, but avoid cold draughts, otherwise many of the blooms will become disfigured through attacks of Green Fly and mildew. Damping petals must be kept removed.

Late Bush Chrysanthemums

These must be fed liberally, as the amount of bloom produced by a single well-grown plant is enormous. Disbudding in many instances will still be advisable, and a re-arrangement of the plants from time to time will prevent their becoming drawn to one side and thereby spoilt as specimens for indoor decoration. If only required for cutting, this is not so important. Fumigate the house occupied by them before colour is advanced, as it will not be advisable to do so afterwards. Early varieties which have already been cut should be stood in cool frames to produce stocky cuttings, but such frames must be protected at night.

Sweet Violets

Those planted in frames must now have the lights drawn over them at night, but air must be freely admitted both night and day unless severe frosty conditions prevail. If Red Spider is proving troublesome, the plants should be sprayed with paraffin soap every 10 days until this pest has been finally checked. Use all spare plants not required for frames to form colonies in the Alpine garden, where they will provide a feast of bloom in early spring.

Bulbs for forcing

The bulk of these will have been transferred from the plunging ground to cold frames, and it will now be a matter of introducing a few to warmer temperatures every 10 days or so, according to requirements. Put up fresh batches of retarded Lily of the Valley crowns and thereby maintain a constant supply of bloom, and place under cover all shrubs and plants which it is intended to force during the winter, including Rhododendrons and Azaleas.

The leaf harvest

Gather together all the leaves possible from sweepings and woodland collectings and form them into a large pile in some out-of-the-way corner where they may heat and become partially decayed. Never remove them from shrubberies as they form the natural food of the shrubs themselves, and if objection is raised to their appearance, a light sprinkling of soil or ashes will bind them down and hasten their decay. There is nothing better for loosening and rendering pliable heavy soils than a good dressing of leaves.

Planting early flowering shrubs

These never look so well planted in isolated groups or individually in the open as they do when provided with a background of evergreens, and this should be considered before operations are commenced, as it makes a vast difference to the effect of these leafless subjects in spring, also in autumn. Many of them develop exceedingly handsome foliage, which stands out in brilliant contrast to a bank of evergreens. A few such subjects include the gorgeous Parrotia persica, Fothergilla monticola, Hamamelis, in variety, Forsythias, Disanthus cercidifolia, Nuttalia Ribes, Magnolia stellata, Prunus, Mollis Azaleas, etc., the latter vivid in autumn.

Globe Artichokes

These suffered badly in the south during the past winter, therefore protection will be given in the form of a mound of litter to each plant earlier than usual, as another repetition such as last year cannot be tolerated.

Celeriac

For the first time during many years this was partially destroyed where left in the open—even though covered over with Bracken—last year, and as in the case of Artichokes will be protected earlier this year and part of the crop stored in a cool shed.

Peas

A sowing of Peter Pan and Little Marvel may now be made in a cold pit or frame to produce a crop of fine early Peas; Primo may also be tried. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Greenhouse Primulas

While these delightful winter-flowering plants must not be subjected to a really low temperature, a warm house is bad for them, so only a very moderate amount of artificial heat should be given. Dampness and closeness are very bad for all the types—Kewensis, malacoides, obconica, and sinensis—so such conditions must be guarded against. In dull, damp days a little warmth in the pipes, with plenty of top air, will keep damp down without unduly exciting the plants.

Herbaceous Calceolarias

These gorgeous plants, when well grown, are very effective and worthy a place in any greenhouse or conservatory. They are almost hardy, and were it not for damp might quite safely pass the winter in a cold frame. It is always better, however, to have them in a low house or pit from which frost is just excluded. Keep free of vermin, and, while the soil should never be permitted to get really dry, too frequent applications of water will so sour it that the plants will quickly get into an unhealthy state if, indeed, they do not actually die. A cool, buoyant atmosphere and judicious watering will ensure a fine and lasting display of bloom later on.

Chrysanthemum cuttings

It is, of course, much too early to think of inserting cuttings of the ordinary varieties, but there are, unfortunately, several good and almost indispensable sorts that are very shy at sending up suckers, so whenever any of these do send up a shoot or two have them secured and planted round the edges of small pots, filled with sandy compost, and set in a cool pit or greenhouse, where the majority will eventually form roots and so ensure sufficient stock.

Early Roman Hyacinths

These should now be well rooted, and may be taken from the plunge and set for a few days in a cold frame before being moved to a warm greenhouse. To induce longish stems suitable for cutting, place the pots a co erable distance from the glass. If for us pot plants in the house, set near the glas that all light and sun may reach them thus build up sturdy, stiff growth.

The planting of Roses

If the ground is in workable condition the plants received from the nursery, this important work should be pushed forv with all speed so that the bushes may ha chance to become established before wi sets in. It is because the soil must be trod down very firmly over the roots that on so earnest in warning the novice aga planting when the ground is very wet sticky. If attempted under these conditi it will set like brick when again dry, and poor plants will be unable to thrive.

Cyclamens

This grand winter-flowering subject is throwing up its flower-stems, and very car watering is necessary, as the presence moisture in the crowns of the plants ca the flower buds to shrivel up and refuse open. Gentle but systematic feeding is advisable. Weak liquid made from sh or cattle droppings is excellent. This be given about twice weekly. Soot wate also excellent for this plant, but should used clear.

Planting fruit bushes

Black Currants and Raspberries sho have well-worked heavily manured soil, do not object to a little shade, while Goo berries, Loganberries, and Red and Wh Currants should have no manure if the is of fairly good quality. As with ot things, all these small fruits should only planted while the ground is working freely.

The pruning of bush fruits

This may be pushed on with all vigour no for it is by no means a pleasant job wh really cold weather sets in. If necessa some of the best shoots should be retained cuttings, and, if inserted now, will eventua form roots. All other prunings should gathered up and burned immediately and destroy any vermin present, not to menti the eggs of same.

Border Chrysanthemums

These have been, and, at time of writin still are, wonderfully fine this autumn, entire absence of frost having permitted ev the latest sorts to open their flowers. Th has, of course, prevented the lifting a storing of the necessary stools for providi stock in spring. With few exceptions, it necessary this side of the border to lift a winter these in frames, therefore, as soon the flowers are past, as many roots as a necessary should be dug up and placed eith in boxes or pots, any light, sandy compo being suitable for placing around them. Ke close for a few days, but afterwards gi abundance of air to prevent the shoo damping. Label each variety carefully, confusion is certain in spring.

Shrubs

Should there be any of these to transplan now is a good time to tackle the work, th majority standing moving at this seaso Hollies, hybrid Rhododendrons, and Azalea however, should not be moved until la spring. In planting do not place too deep the ground; many failures are traceable want of care in this respect. Always see it that the soil is well trimmed round th roots and no cavities left. Where necessary place strong stakes to prevent rocking by th winter gales. C. BLAIR.

Preston House Gardens, Linlithgow.

dil bulbs

S., Hassocks).—It is usual to plant the
ogether as you receive them from the
as they bloom quite satisfactorily. At
me time, you would increase your
r by dividing the offsets from the
bulb, and these, in turn, would also produce side bulbs, but the flowers would be weaker the first year than would be the case if planted as sent out.

Position for the Christmas Rose (Helleborus niger)

(Hector, N.Y., U.S.A.).—The essential cultural details of this good flower are deep sandy loam—3 feet in depth is not too much—perfect drainage, light shade, and, above all, September or October planting. It is fatal to success to plant these in big lumps intact; they must be freely broken up. They do remarkably well in company with deciduous Ferns, which shade their foliage during summer. If such cannot be arranged, it is advisable to plant them on the cool north side of a wall or fence or any position where they are shaded during the greater part of the day, hence the improved condition of those you have on the west side of the Barberry hedge. Never plant them in full sun in your country.

Raising seeds of Alpine flowers

(Hector, N.Y., U.S.A.).—You have left it rather late for this, as few things will germinate this year if sown now, and we advise you to defer sowing until March next year, when you will be able to rear quantities of Alpine flowers in a cold frame. The seeds should be sown thinly in well-drained pans or pots, filled with light sandy soil which has been put through a finely meshed sieve. Before sowing, water each receptacle with a fine-rosed can and when settled down sow the seed, covering it as thinly as possible with fine soil. Stand the newly-sown seeds in a cool frame and cover each receptacle with a sheet of glass or slate to conserve moisture until germination has taken place, when the

Fifty Years Ago

Alpine plants and hardy bulbs on the window-sill

THIS is now the fourth season since my outside window-garden was planted, and it has gone on improving so that in the hottest day of summer and the coldest day of winter it is full of attraction. Saxifrages, Sedums, Sempervivums, Campanulas, Lithospermum, etc., are one or other in flower; and as regards bulbs in autumn, we have the Sternbergia. Zephyranthes, autumn Crocus, and Colchicum; following these come the Snowdrop, the spring Crocus, and Scilla sibirica; and in window gardens, where a greater depth of soil is given, the Hyacinth and the Narcissus may be introduced with advantage. The construction of the outside window-garden may be stated to be of the simplest possible character, so that anyone can make it, or have it made by an ordinary carpenter. We used yellow deal, and the width may range from 1 foot to 2 feet, according to space. At the back of the garden is a strip of wood 3 inches in height, which may be made higher or lower according to taste, and scalloped or plain. The front should be somewhat ornamented. This structure, while resting on the sill of the window, is raised on blocks ¼ inch to allow of drainage, and preserve the sill from damage. The soil used should be a good compost consisting of road-scrapings, loam, and leaf-soil, the surface undulated according to taste, working in judiciously a few stones or shells, so as not to be conspicuous, and then planted to be the most attractive from the room. Between the scallops or ornamental part of the woodwork in the front trailers should be inserted, so as to have the best effect, with Sempervivums as rosettes, or if a rustic facing is given to the garden, Sedums, Saxifrages, and other rock-loving plants do well. When shells are introduced, small-growing Sempervivums, such as montanum, or the Cobweb House-leek, are the most desirable to plant in them. The class of plants which I consider most desirable for a window garden are the dwarf-growing Alpine plants, with just sufficient elevation to break the lines, and from the following genera a good selection can be made: Alyssum, Androsace, Antennaria, Arabis, Arenaria, Armeria, Arum, Aster, Aubrietia, Bambusa, Bellium, Campanula, Dianthus, Draba, Dielytra, Echeveria, Erinus, Hepatica, Iberis, Linaria, Linum, Lotus, Lithospermum, Lychnis, Lysimachia, Myosotis, Nierembergia, Oxalis, Phlox, Potentilla, Primula, Sibthorpia, Soldanella, Spergula, Saxifraga, Sedum, Sempervivum, Silene, Thymus, Viola, Veronica, according to situation and aspect. Of bulbous plants, add Sternbergia lutea, with its large yellow Crocus-like flowers in autumn; Zephyranthes candida, with its silvery-white blossoms in autumn, the autumn Crocus and the autumn Scilla; and for spring blooming, the intense blue Scilla sibirica and bifolia, the spring Snowflake, the Snowdrop, the Crocus, the miniature Hyacinth, the Narcissus Bulbocodium, nanus, and minimus, the Bulbocodium vernum, the dwarf early Tulips, Iris persica and reticulata, and, besides these, many other bulbous and tuberous-rooted plants would contribute their charms, so that within a limited space a garden may be had with representatives from every temperate clime. The invalid who can only be moved in a chair can tend this garden, while those who are much confined indoors have only to turn their eyes to the window to enjoy a pretty miniature Alpine garden. To children it is a delight. In their culture there is no difficulty, and the window garden once planted simply requires to be kept clear of weeds and attended to with water.—P. B. —*July 5th, 1879.*

latter should be removed and the seedlings gradually exposed. Water sparingly until growth is well advanced.

Taking cuttings

I am finding it very difficult to root the following cuttings :—Verbena, Heliotrope, Irisene, and Cineraria maritima. Would you kindly advise me if all or any of these should be taken with a heel, and what temperature the propagating frame should be for such?

YOUNG GARDENER.

[If you are attempting to root these bedding plants at this season we do not wonder that you find it a difficult matter. They should have been inserted at the end of August or early in September, and would then have rooted in a cold frame if kept fairly close and shaded. Secured at the proper time, none of them require to be taken with a heel, while now it is hardly likely that many would form roots even with heels, but if you do try them, do not keep the frame too close or too warm—about 60 degs. would be ample. In spring it is different, a fairly brisk, bottom heat giving good results.]

GREENHOUSE

Smilax in vinery

I have here some Smilax—sown early in 1928—and planted out in boxes, the same as is usually used for Tomato growing, and placed at the foot of the rear wall of a Muscat-vinery. It grew very strongly this summer, being supported in the usual way with thread, and has reached the top of the wall, some 18 feet to 20 feet. I want Smilax for decorative purposes for a function that is not until the middle of December, but as it shows signs of going back now, could you tell me of any method I could adopt to ensure it lasting fresh and green until that date? The Grapes are all cut, and the house kept perfectly cool, only excluding frost. I am giving the Smilax less water, but not to the extent of drying it off. Also, I have discontinued feeding. Is the latter a mistake, as the roots are pretty cramped and the hot season may have caused the Smilax to ripen off prematurely?

"WORRIED."

[We regret our inability to advise in this matter, further than to say that you should keep it as cool as possible, without, of course, allowing it to get frosted. Watch that the soil never gets dry, and perhaps the tops, at least, may remain suitable for your purpose.]

Eustoma Russelliana

(C. S. P.).—Seed of the Eustoma can be had from Messrs. Carter Page and Co., 52, London Wall, E.C. 2, or Mr. A Dawkins, 408, Kings Road, Chelsea, S.W. 10.

CHRYSANTHEMUMS

Pompom Chrysanthemums

Referring to the note on Pompom Chrysanthemums in your issue of October 19th, I would be glad to know if the Chrysanthemum named Little Bob is the same as Little Brown Bob mentioned in two numbers of GARDENING ILLUSTRATED (November 3rd and November 17th) of last year under the title of "Disappearing Plants." I would be obliged if you could inform me if, and where, this Chrysanthemum can be purchased, also the two others mentioned with Little Brown Bob, Little Old Claret and Little Old Yellow. I would like to add that our Christmas present from a gardening friend for two years has taken the form of a year's subscription of your paper, which has proved a most interesting and useful present. ALICE WRIGHT.

Westways, Barnett's Road, Knock.

[The Chrysanthemum Little Brown Bob is distinct from Little Bob, being a brown sport of that plant. As regards the others, all our efforts to trace them have so far failed, and this leads us to suspect that they have been lost to the trade, although some private grower who cares for these small flowers may still have a few plants in his possession.]

ROSE GARDEN

Rosa Hugonis unsatisfactory on hot wall

(Italia).—This lovely species does not require a wall, especially in your country, and we attribute its failure to the position being too hot and dry. This Rose forms a large, graceful bush when grown in the open, reaching several feet in height and diameter. If, however, you must keep it on the wall we advise you to trench deep and enrich the soil, and during the summer months, at least, keep a heavy mulch over its roots. The lovely single Rose Mermaid (yellow) would enjoy such a position. Permanently to soften the colour of your wall apply a coat of cement three parts to one part of soot, well mixed and rather thin, so that it may be applied to the wall with an ordinary whitewash brush.

TREES AND SHRUBS

Lonicera tragophylla

(H. J. H.).—This very attractive Chinese species with large yellow flowers is listed by Hillier and Sons, Winchester.

Die-back of Yew

(Constant Reader).—We have now been able to clear up your trouble with your Yew trees. They are attacked by the caterpillar of a moth, Batodes angustiorana, Haw. We were able to find the little caterpillars hibernating in some of the specimens which you sent. The caterpillar is about $\frac{1}{2}$ inch in length, of a green or yellow-green colour, with black markings on the sides, having a dorsal line of a lightish yellow colour. They hibernate during the winter in cocoons of hair and leaves of the Yew tree. They eat the woody portion of the twig, and this causes it to wither, and, in most cases, the caterpillars are overlooked, and the resulting damage is laid down to frost or other seasonable conditions. The only control for the pest appears to be shaking the caterpillars from the trees in early summer. The easiest way to kill the caterpillars shaken down would be to spray them with a good nicotine wash. If it is practicable to spray the trees, a good nicotine wash would kill if it was applied in early summer, just after the caterpillars had hatched.

Forcing Lilac

(C).—This is a suitable time to bring pot Lilacs in, and now they have had the frost on them it is an advantage, although not essential. We see from your letter that you have them already well established in pots. A great thing about them is to force gently; if you attempt hard forcing it will only lead to leaf growth and very little flower. Needless to say, careful watering is essential, and the trees should be syringed freely on sunny days. Lilacs take copious supplies of liquid manure when once they show flower buds.

Beech tree injured

(E. W.).—As you have removed the cause of the trouble, your tree should ultimately regain its normal health. There is little you can do to the wound, except to apply a good coating of grease, which will have the effect of protecting same from fungus and insect life. If you can give the tree a good mulch of farmyard manure you will improve its health.

Saving an old tree

(Italia).—We have no knowledge of the method you refer to, and would certainly hesitate before applying it to any tree of value.
The approved method of dealing with
trees is to remove as far as possible
cayed portions by scraping away—to
wood or bark—every particle of such m
afterwards filling in the cavity with con
which should be sealed with cement n
so as to prevent both air and moisture
entering. This method has saved an

How do you buy *your* BONEMEAL?

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter. Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

A free sample will convince you. Write for it to-day.

**DERRICK & CO., 553, Liverpool Road,
HOLLOWAY, LONDON, N.**

thoroughly done, as it is necessary to wet each bug with the spray fluid. It is usual when spraying to commence at the top of the shoots, proceeding to the base, and then, turning rapidly, come up to the top again. By so doing most of the bugs are usually caught by the spray fluid. The formula of the spray fluid is:—Nicotine, 3 ozs.; soft-soap, 4 lbs.; water, 40 gallons. If these quantities are too large you can make a smaller quantity as long as you keep the ingredients in the same ratio. The best time to spray is towards the end of April or beginning of May.

Plum tree failing

(D. J. M.).—There are several probable reasons for your Plum tree failing to mature its fruits. It may be that the flowers were frosted or they may have opened during bad weather when bees and other insects were unable to distribute the pollen, for obviously the impregnation had been imperfect, or the fruits would not have dropped. As they bear plenty of blossom, there cannot be much wrong with them otherwise. In another year you should protect the trees while in flower with a double-ply of fish-netting, which would ward off frost and yet permit bees to work.

Bitter Pit of Apples

(R. F. S.).—Your Apples are affected with Bitter Pit, which is one of the so-called physiological diseases. The cause of Bitter Pit is not clearly understood, but it is usually looked upon as being caused by nutritional disorder, shortage of water, or any one of the plant foods which are usually applied as manure may cause the trouble. Naturally we cannot be of much assistance in this, because we do not know what manures you have applied and the type of soil on which your trees are growing. You will probably be able to say whether it is a question of water shortage, and if you are sure that this is not the cause of the trouble you could try and find out what chemical is required. We would suggest that you try a dressing of sulphate of potash at the rate of 1 oz. per square yard, as potash shortage is often the cause of the trouble.

Colour instead of glaring white wall

(J. W. M.).—Keen's cement applied very thinly over the surface of a plastered wall will result in a soft pink finish, and is used where an extra fine finish is desirable. Or you may use red or other coloured ochre in your plaster when mixing to produce the desired result. This is easily obtainable from builders or builders' merchants.

Destroying worms in crazy paving

(A. N.).—Worm destroyer, used at the rate of half a pound to each square yard and watered in, will bring the worms rapidly to the surface, where they soon die. Water must be given until all the destroyer has disappeared. This should in no way damage the plants. Worm destroyer is offered by most horticultural sundriesmen, and may be obtained from Messrs. Willis Bros., Harpenden, Herts., who would send you their price list.

Ornamental Grasses to grow in a herbaceous border

(R. E. T.).—Apera arundinacea, Spartina cynosuroides, Eulalia japonica zebrina, Elymus glaucus, Eulalia gracillima, E. japonica fol. striata, Dactylis glomerata elegantissima, Stipa calamagrostis, S. elegantissima, Gymnothrix latifolia, Aira cæspitosa.

SHORT REPLY

L. S. O.—Cratægus Crus-galli (Cockspur Thorn): Yes, this beautiful and distinct Thorn should, with cultivation, grow well on a Welsh mountain unsheltered and 700 feet above sea. It is, in fact, one of the hardiest and most thriving of a very hardy race.

NAMES OF PLANTS

D. J. M., Inverness-shire.—Scleranthus perennis. A British wild plant known commonly as Knawel.

H. M. Jenner.—Chrysanthemum faded when it came to hand, but is, probably, Little Bob.

"*Regular Reader,*" *Carlisle.* — Chrysanthemums: 1, Lichfield Purple; 2, Dolores. There are quite a number of colours among the Pompon Chrysanthemums, including several shades of yellow, bronze, pink, deep red, cerise, claret, blush, white, etc.

C. W. L.—5, Tunica saxifraga; 6, Sempervivum arachnoideum (Cobweb House Leek); 7, Thymus serphyllum lanuginosa; 8, not recognised; 9, Achillea serbica.

O. M. R.—T, Cotoneaster Simonsii; U, C. Simonsii; W, Berberis aristata; X, B. sanguinea; V, not recognised (must have berries); Y, Berberis vulgaris; W. B. Wallichiana.

Alice Wright.—1, Chrysanthemum Little Bob; 2, Berberis vulgaris; 3, Lonicera nitida, the flowers of which are small, inconspicuous, and of little interest.

A. S. Norris.—1, Stachys lanata; 2, Erigeron speciosa, probably a better example desirable; 3, Sedum lydium; 4, Geranium ibericum.

H. Mills.—1, Veronica cataracta; 2, Androsace lanuginosa; 3, Parochetus communis (Shamrock Pea); 4, Veronica Bidwillii lilacina.

D. L. Carver.—Cratægus azarolus.

R. E. T.—Grasses: 1, The variegated one may be Phalaris elegantissima, specimen insufficient; 2, Stipa pennata.

NAME OF FRUIT

A. J. B. B., Cirencester. — Cornish Aromatic.

LATE NOTES

Mr. A. Hughes

We learn that Mr. A. Hughes has taken over the nurseries and will trade as A. Hughes and Son, Hardy Plant Specialists, Sundridge Nurseries, Sutton Green, near Guildford, for the purpose of specialising in rare hardy and half-hardy trees and shrubs, Alpines, and herbaceous plants. Previous to starting on his own account, Mr. Hughes was manager for Messrs. Gauntlett and Co., Chiddingfold, Surrey, 2½ years, and previous to that 20 years with R. Wallace and Co., Ltd., Tunbridge Wells. His early training was obtained in the Royal Gardens, Windsor, and Royal Botanic Gardens, Kew. Mr. Hughes has our good wishes for the success of his new venture.

A lecture on Cyclamens

The Royal Tunbridge Wells Gardeners' and Horticultural Mutual Improvement Association was favoured with a visit from Mr. E. R. Janes, of Messrs. Sutton and Sons, of Reading, who gave a most interesting lecture on the cultivation of Cyclamen on the evening of October 29th. The lecture, which was illustrated by lantern slides, was very much appreciated by a very large number of members, as Cyclamens are very popular plants amongst the gardeners of the district, and many fine specimens have been shown at meetings on various occasions.

Special mention should also be made of the wonderful collection of fruit staged on this occasion in competition for the Bunyard Medals, Mr. H. E. Kemp being placed first, with Mr. H. Lazell a good second.

Chrysanthemums were also very good, some very fine blooms being staged b
R. Macdonald, gardener to Sir D
Watson, Bart.

Perhaps the most attractive exhibit
room was the splendid collection of
tables (nine varieties) shown by M
Charman, of Groombridge Place.
were of splendid quality.

Feeling reference was made by the
man to the sad loss this Associatio
sustained by the death of Mr. W. H
Tonbridge, one of this Association's
members.

OBITUARY

MRS. CHARLES FREDERICK HOFFMAN

The death is recorded at King's
of Mrs. Charles Frederick Hof
formerly of New York. The dec
lady was well known around New
through her activities in garden club c
In 1916 she was President of the Interna
Garden Club, and was instrumental i
inauguration of what was believed to b
first open air summer flower show on a
scale ever held in America. Mrs. Hof
took up residence in England about 10
ago, purchasing the Norfolk residence o
Marquis of Lothian. She continued her
interest in horticulture, making her
gardens famous. In June, 1921, she ac
panied the Prince of Wales at the openi
the horticultural show at Norwich, b
President of the Norwich and Norfolk
cultural Society. In the recent electio
was a candidate for Parliament, but ma
unsuccessful fight against the present L
Minister of Agriculture.

MR. F. HANSON

East Anglia has lost another of her
old gardeners by the decease of M
Hanson, who had charge of Somerle
Hall Gardens for many years. He rec
his early training at Welbeck Abbey
carried the high cultural traditions of
establishment to Somerleyton. In fo
years he was a Trojan of the exhibi
especially in the early days of the l
flowering Japanese Chrysanthemums.

At all local horticultural gatherings
could not but notice the bond of frien
of the trio, Wm. Allan, Herbert Oclee,
Fred Hanson, all of whom have no
parted, but their work and memory wil
on.

Sharpening secateurs

The Mèdoc and Guienne Patent Sécat
Ltd., of 25, Spencer Road, Chiswick,
don, W. 4, have for some time past been
plying a number of their old customers
sécateurs, flower-gathering scissors,
pruning knives. These are sharpened
new process which retains the edges a w
year without requiring resharpening. M
over, the edges are brought to a perfe
of sharpness hitherto unobtainable. So
the process is done by hand, and can onl
applied to a limited number annually. T
who have had tools thus treated are
enthusiastic in their praise, for not only
they so effective and durable, but the
of the tools are indefinitely prolonged.

"OXFORD ROADLESS" BARROWS

are ideal for carrying loads over soft and uneven ground which an ordinary wheelbarrow cannot face satisfactorily

A HIGH-GRADE PRODUCTION CONSTRUCTED OF THOROUGHLY SEASONED TIMBER

The following are extracts from a few of the many appreciative letters received:

"The barrows have been in daily use for the past ve months under all conditions, viz.: over rough, smooth, and oggy ground, and we have pleasure in testifying to their fficiency."

"I have nothing but praise for your Creeper tracks, specially on a three-creeper truck which you made for me a ear ago, and I cannot speak too highly of its work."

"We now have a good many of these barrows in use, nd they are a great saving in labour. We would not be ithout them for anything."

"Nearly twelve months ago we purchased a barrow tted with one of your track wheels. We found this very seful, and far superior to the old style of wheel."

MAKE YOUR GARDEN PAY

These four books are indispensable to everyone who wants to make his garden more profitable, more beautiful, and less of an anxiety.

SUCCESSFUL SPRAYING
by P. F. Fryer. 7s. 6d. net.
"This book can be strongly recommended to the grower who wants a handy volume in which he will find such information as concerns his plants set out in a concise and understandable manner."—*Journal of the Royal Horticultural Society.*

PRACTICAL SPRAYING
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
This book is one of a series of small practical handbooks written by specialists for the use of market gardeners, fruit-growers, nurserymen, etc. "Practical Spraying" describes the most effective measures to take against the various pests and diseases that ruin crops.

VIOLET CULTURE
by F. E. Dillistone, F.R.H.S. 2s. net.
This is the first book ever written explaining how to grow violets for large scale production in this country. It is full of expert information, and will prove equally valuable to the market gardener and to the amateur grower.

STRAWBERRY CULTURE
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
"The grower who cultivates a crop with brains stimulated by Mr. Morton's little book can reasonably expect to make a profit."—*Farmers' Express.*
"Of the utmost value to growers." — *East Anglian Daily Times.*

Cox's Orange Pippin

A bunch of fruit showing result of cross pollination

Since money will often not buy the quality of fruit which one can grow in one's own garden, the money spent on half a dozen trees is well invested, but it has been shown that one will secure more fruit from *five* Cox's Orange trees and at least one of the varieties (it is safer still to have two) from those mentioned above, than if one had six trees alone of Cox's Orange Pippin.

A Word on Pruning.

It should never be forgotten that more trees are spoilt through over pruning than by neglect. One should know why one prunes. A tree is pruned to keep it with some young growth coming on, but if one prunes too much we get a superabundance of young growth and too few fruit spurs. If we do not prune at all we secure too many fruit buds and the tree becomes stunted.

The proper method is to prune according to the need of the tree. If it makes a lot of new growth the leading shoots should only be pruned lightly (say, one-third only of the young wood should be cut back). If the tree is making little growth the leading shoots may be cut from one-half to two-thirds back. If side growth become long one prunes these back to about six eyes in the case of the Cox's Orange Pippin, but varieties like Irish Peach and those which fruit on the points of the shoots must, of course, not be cut or pruned in this way.

On poor soils, or where the trees are fruiting heavily, it pays to mulch the roots. For a tree of moderate size 2 ounces or 3 ounces of sulphate of potash lightly hoed in during the spring or early summer and the soil around the roots lightly mulched with some material, preferably stable manure (or even leaves if nothing else is available), must assist the tree and serve the dual purpose of feeding the tree and preventing exhaustion, which, in turn, produces biannual fruiting, also keeps the roots to the upper strata of soil. Cox's Orange Pippin succeeds better when its roots are not penetrating into lower wet subsoils.

Many people spend more trouble on growing Cabbages than Apples, but a little attention to the latter is well worth while.

Other varieties of really good flavour even if not quite so good as Cox's Orange are Langley Pippin and Irish Peach, to be eaten from the tree in August, Miller's Seedling, James Grieve, Red Coat Grieve, Ellison's Orange for September and October, with Laxton's Superb and Saltcote Pippin to follow after the Cox's Orange in the early year. Lord Hindlip and King's Acre Pippin, both keep crisp until March and April. All of these make a fine sequence and keep us supplied for many months in the year.

For those who like colour in

fruit it may be mentioned that there is now a sport of Cox's Orange Pippin available and named Crimson Cox. In every respect except colour this is the same as the original, but, being new, costs a little more to obtain. LAWRENCE J. COOK.

NOTES OF THE WEEK

British Carnation Society

The Society's Autumn Floral Meeting will be held at the Royal Horticultural Society's Hall on November 20th and 21st and Annual Dinner on November 20th. Visitors to these functions are reminded that the railway companies offer cheap fares to London on these dates from many centres. Members of the British Carnation Society and visitors should avail themselves of these facilities where possible. Further information supplied by the Hon. Secretary, Mr. F. W. Alesworth, 17, Avenue Road, Isleworth, or from the railway companies.

The Potato crop

In most districts the bulk of the Potato crop had been secured under favourable conditions by the end of the month. Reports indicate that the crop is of good quality and generally free from disease, although the tubers are on the small side. The yield per acre over the whole country is forecasted at 6·5 tons, which, although ⅖ ton per acre above the average for the previous ten years, is nearly ¾ ton below the record yield per acre in 1928. The total production from an acreage 30,000 acres greater than last year is forecasted at 3,350,000 tons, or 163,000 tons less than in 1928 and 265,000 tons above the ten years' average.

Outdoor Rose blooms

Messrs. Benjamin R. Cant and Sons, Ltd., The Old Rose Gardens, Colchester, were again honoured this year by supplying cut Roses for decoration at the Lord Mayor's Banquet, Guildhall, held November 9th. The Roses supplied were all cut from open fields, and some of the varieties sent so late in the season were Mrs. Beatty, Etoile de Hollande, Emma Wright, Mme. Butterfly, Ophelia, Los Angeles, Diana Cant, Shot Silk, and Padre. The fact that Roses are cut from June to November shows the great floriferousness of the modern varieties.

Pyracantha angustifolia

Apparently this shrub is not so well known as the other members of the genus, probably due to the fact that it is rather tender in the open ground. In the warmer and more favoured parts of the country, however, it succeeds very well against a wall. I have tried it in various situations and aspects in this district (Midlands), but with only partial success. Although it survives, flowers, and bears fruit, it grows very slowly, and makes little headway, but it has never appeared entirely happy under the conditions prevailing here. Where it can be induced to grow, it is certainly worth while, and merits attention.

P. angustifolia is an evergreen shrub, hailing from W. China. Its height is stated to be 10 feet to 12 feet, of a dense spreading, bushy habit, with rigid, horizontal branches, often spine-tipped, covered the first year with a thick, grey down. It has narrow, oblong, or slightly obovate leaves, ½ inch to 2¼ inches long, smooth, dark green above, covered beneath with grey felt. Its white flowers are produced in corymbs about 2 inches across. The fruit is a brilliant orange-yellow colour when ripe, flattened at the top, and covered with grey down when young, as in the case of the young shoots. It is valuable for the length of time it retains its berries in full beauty, often until March. J. L.

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Lilium canadense and its geographical distribution

IN your issue of November 2nd there is an interesting article (page 739) on Lilium canadense. I can confirm all that was there said on it.

Our friend, however, does not give anything like the whole of its geographical distribution, as it is found throughout Canada, even into Subarctic regions. A very beautiful form is found in Saskatchewan, which my daughter found growing in the marshy sides of Crystal Lake, in Central Saskatchewan, which is a sort of holiday resort for people in that neighbourhood, and again near Edmonton, where it stands 50 degs. below zero.

Another interesting plant found in those regions, near the great White Trail (which was the migration path of the bison, and where there are thousands of their bones bleaching on the prairies), is the Canadian Cactus, a species of Opuntia, which evidently preserves itself from the terrific below-zero weather by attracting dead leaves and grasses on its spines, which make a veritable nest about it. This must also stand easily 50 degs. below zero, and a succulent at that. One thinks usually of Cacti as denizens of terrifically hot zones. This species is a last northern remnant of a tropical flora which once covered all the northern portions of America. Coal found on the Arctic Islands and Bread-fruit trees in the Greenland fossils are evidences of this phase of our earth's life.

J. HENRY WATSON, F.E.S.

Manchester.

Lilium canadense

Native of sub-arctic regions

Apple Allington Pippin

I quite agree with all that "A Scottish Gardener" says about the above Apple, which I consider one of the best cropping varieties we have. One thing the writer omits to mention is that it is an excell
culinary variety, as well as a dessert, and
a Christmas Apple, when it has been corre
gathered and harvested, it is one of the
flavoured. To grow them well the trees m
be kept clean, otherwise they are apt to
come attacked with leaf spit and the f
scabby and cracked. Another import
factor is to thin the fruit well in its you
stages. I have had dealings with this Ap
for many years in various parts of Wales
England, and have never known it to
in anything like an Apple season. The sa
applies to Worcester Pearmain, which is c
demned by many, although it always m
with a ready sale during September.

Craigston," Exmouth.

Ceratostigma plumbaginoides

is generally recognised that good blue ers are scarce in the garden, and, as the ur is very popular, it behoves gardeners eize on every really first-rate blue flower can be found. The subject of this note deal for the sunny parts of the rock len. It is a perennial, of a pleasing habit rowth, and in autumn it bears a profusion vely blue flowers. I am writing this note November 9th, on which date Ceratona plumbaginoides is worth looking at in garden. It rejoices in a sandy loam, and d that it is essential in the interests of a constitution to transplant the stock every l year. The present is a suitable time to he work. Anybody who desires to en- e his colonies of the species can do so by ling the roots, a process which does not arrass the plant in the least.

earson Park, Hull. G. H. C.

The Fairy Oak at Holywell

ENCLOSE a photograph of this very fine ld Oak tree in my garden. It is alled "The Fairy Oak." The girth 3 feet n the ground is 22½ feet, and it is in a good state of preservation, as you will from the photograph. Pennant in his istory of Whitford and Holywell," ten in the 18th century, describes it thus: spreading Oak of great antiquity, size, extent of branches; it has got the name Fairy Oak. In this my century, a poor ager, who lived near the spot, had a child grew uncommonly peevish. The parents buted this to the fairies and imagined it was a changeling. They took the child, it in a cradle, and left it all night beneath tree, in the hopes that the tylwydd teg, airy family, or fairy folk, would restore own child before morning. When morncame they found the child perfectly quiet, vent away with it quite confirmed in their ef." Perhaps the readers of Gardening strated would be interested in the photoh of the tree and this account of it.

he Tower, Downing, L. B. Butler.
Holywell, N. Wales

The Fairy Oak at Holywell

Autumn flowers

ay I venture to protest against the dull ormity of Michaelmas Daisies or Dahlias our autumn garden? There really are r plants that can be used by those who y care for their autumn show. Last ter was a severe one, as we all know, and nsias were cut down to the ground in t places, but did that interfere with their vth and profuse flowering? On the con- , I think they were more beautiful than . That charming sub-shrub Ceratostigma mottiana suffered like the Fuchsias, yet, them, it was a mass of brilliant blue er-heads in September and October, ng an impression of spring beauty rior to any autumn Gentian, however tiful in itself. The white Crinum elli was fuller of flower than I ever saw but it does not last later than mid- ember. Still, it is a grand thing in flower foliage, and requires no very special care. here are now good Multiflora Roses, both e and pink, that can be depended upon an autumnal show, and deep reds also those that prefer them. Roëd Hatte is aps the most perpetual of them, if not most beautiful.

hat best of Olearias, O. Olæifolia, must not be forgotten, as it blooms gaily on into October, and has such a spring-like green in its leafage that it is specially welcome.

I have in my mind a big border planted with irregular lines of Fuchsias gracilis and Riccartoni, interlacing one another, and allowing the F. Riccartoni to stand, if not cut down by frost, but always cutting down F. gracilis; towards the front the Multiflora Roses and good masses of Ceratostigma, broken now and again by that most indispensable of hardy Fuchsias, the white corollated Mr. Cornellisen, which I am glad to think my good friend Miss Jekyll has kept from oblivion. There are other good varieties no doubt, but its upright habit is especially valuable. Silver-leaved Cineraria Maritima and the Crinum Powelli can be grouped judiciously in places and Olearia and Arbutus in the background if bigger plants are desired.

I do not think I ever saw a more engaging border in October than one where I saw Fuchsia Cornellisen, Ceratostigma, and white Multiflora Roses prettily grouped; no doubt it would be very flowerless in summer, but in a fair-sized garden its spring-like effect in autumn is well worth waiting for, and a suitable place found for it. There are several autumn-flowering Lilies worth a place in this border, and the good old Lilium Auratum is worth planting. It is thought not hardy, but that is not really the case. The reason is that it is a perennial rooting bulb, and the Japanese, for convenience in packing, cut off all the roots. In consequence of this, the first year's flower buds must be cut off as soon as they show, as the bulb does not make any new roots till autumn. So if it is allowed to flower that first year, the bulb dies of exhaustion, and that is the secret of its future existence, not its want of hardiness. Shelter and a light soil are desirable, but it will survive in anything but the stiffest and most calcareous of soils, and enjoys the shelter of Fuchsias. Edward H. Woodall.

Patrinia palmata

There is more variety among the later-flowering rock garden plants than many suppose, and, with care in the selection, it is possible to prolong the bloom considerably. A genus which contains several suitable plants for flowering into September and even later is that of Patrinia, one nearly allied to the Valerians, but, in most of the species, giving yellow flowers. Not many of these species are grown, and few are offered by the trade. There is a considerable resemblance among them, but one which may be taken as representative of the best is P. palmata, appropriately named because of the palmate character of the leaves, which are also pleasing with their glossy surface. The individual flowers are small, but are arranged in heads which make quite a pleasing effect, although not a showy one. P. palmata grows from 6 inches to 9 inches in height, and is well suited for the rock garden. According to some, it should have a rather cool position in the rock garden, and may even be grown in a sunny bog. I am not sure that I can recommend these places in preference to a moraine, where it grows and flowers well, although not so tall as in the other places. P. palmata is quite hardy, and may be increased by division or raised from seeds. P. rupestris and P. villosa are also good species, but I am not aware that they are offered either in plants or seeds. S. Arnott.

Pancratium illyricum

This delightful bulbous plant is tolerably hardy, except in the colder districts. The bulbs require deep planting in a well-drained loam soil, suitably enriched, and when established, should not be distributed until division and replanting become imperative; a little protection during winter is advisable. A border at the base of a south or south-west wall or near a greenhouse will provide an excellent site for this plant; the flowers are produced in summer, and the broad, strongly-veined leaves are deciduous. The height of a plant in flower is about 8 inches. Division or removal of the bulbs is best effected soon after the decay of the leaves. One other species suited to gardens in mild districts is P. maritimum, a larger plant of equal merit. Offsets afford a means of increase, and, as occasion requires, they may be separated from the parent bulbs and placed in a rather dry, light soil. These two Pancratiums are ideal plants for a cold greenhouse where, if grown in pots, they require a well-defined period of rest.

RALPH E. ARNOLD.

Linaria origanifolia

In his interesting and informative article on "October Flowers in a North-East Yorkshire Garden," Mr. Lofthouse mentions Linaria origanifolia as among other Linarias in his garden. I am pleased to see that this finds a place there, as this plant is not at all a common one, although easily raised from seeds, and, although a little tender, often reproduces itself from self-sown seeds. It is quite a good plant, as I found when I first grew it more than 30 years ago, although not a very showy one, and I was horrified to find that, according to Farrer, its proper name is Chænorrhinum origanifolium, a title which is hardly likely to be adopted in gardens in view of its cumbrous specific designation. It is said to be variable in its native habitats in the Pyrenees, but from purchased seeds it was quite constant with me. It grows to a height of 6 inches, or a little more at times, and has an abundance of dark green leaves on a shapely plant, and is dowered with a profusion of rose-purple flowers of the Linaria form for a long time in summer and autumn. Although Farrer tells us it is both perennial and hardy, he adds that it is not so in "very damp, low, and stagnant soils." He advocates stony soil and full sun, but I have lost it occasionally, when plants were old, in severe winters, and had to rely upon self-sown seedlings, which often come in sunny positions on rock-work. I am thinking of trying it on the moraine, where it should do admirably and live longer than in the rock garden. It is a very distinct and attractive subject.

S. ARNOTT.

Daffodils in New Zealand

Mr. Guy Wilson, of Daffodil fame, had a great reception when he reached New Zealand, and his visit is causing much interest among growers. On the Auckland Railway station platform he was met by Mr. N. R. W. Thomas, of the New Zealand Institute of Horticulture, Mr. J. H. Braithwaite, on behalf of the National Daffodil Society of New Zealand, and Mr. A. E. Grindrod, representing the Auckland Horticultural Society. Mr. H. Poole, the well-known Wellington grower, accompanied Mr. Wilson.

THE RED CUP POPULAR.

Speaking on the trend of hybridising in the Old Country—hybridising being his specialty —Mr. Wilson said the growers were very strong on the red cup. The red cups were very popular at shows, probably because they were showy, and some of them were very good market flowers. Personally, he did not think many of them were very good garden plants, because they faded in the sun. The yellows and whites were better for the garden. The red cups were suitable for the market because they could be cut while opening, which was a great advantage when they had to be sent to a distance.

From what he had seen he was inclined to think that in the purity of the whites the English Daffodils were superior to those he had seen in New Zealand. It seemed to him that it took the English bulbs some five or six years to become acclimatised before they were able to show their best form. The Daffodil was a hardy fellow and liked a winter, so it was possible the milder climate of New Zealand was not so suitable. In Mr. Poole's garden at the Lower Hutt, N.Z., Mr. Wilson saw some Poetaz Glorius raised by Mr. J. C. Williams, of Cornwall, which were doing very well indeed. Glorious was going t one of their best market flowers at Hom

While in Auckland, Mr. Wilson was lo after by the Institute of Horticulture and horticultural societies and well shown aro Among the entertainments in his honour a complimentary lunch held at the Farm Trading Company's rooms, the insti officials being the hosts. Mr. Wilson jud at the Auckland Daffodil Show.

The Spanish Broom

There is something delightfully refresh about the Spanish Broom (Spart junceum). Its golden-yellow blossoms w are so freely produced in summer-time s to bring the atmosphere of the moorland the garden. The shrub has a graceful h of growth which harmonizes well with scheme of planting, and I do not hesitat recommend readers to insert it during coming planting season. I have found th position in full sunlight is necessary in o to assist the Spanish Broom to develop fl ferous stems, and the roots appreciat moderately rich soil. One good bucketfu farmyard manure should be incorporated w the medium around the roots at plant time.

G. H.

Saving seeds of trees and shrubs

The raising of these is a profitable and fascinating occupation, and one full of s prises, as one is never quite certain that so thing of an unusual nature is not likely appear among a batch of seedlings. The la are also more vigorous than cutting pla therefore, gather a few sprays of favou Berberis for seed, also Rose Heps, Clema Spindle trees (Euonymus), Hollies, the g geous American Thorns, Viburnums, Hon suckles, Vines, Magnolias, Sorbus, a Aronia, and raise them at home.

Sit Down and Travel—III.

By T. Hay, V.M.H., Superintendent, Hyde Park

All readers will join in welcoming this further instalment from Mr. Hay—it is the third annual article we have had from him on this interesting topic. In this article the author deals with many desirable and long lost plants in Chili, Colombia, United States, Neilgherry Hills, and a most wonderful Gentian under the title G. coronata, in the Himalayas

HE Editor is of opinion that another instalment under the old title "Sit Down ind Travel" in due, in spite of the com- t made by a correspondent who wrote to hat the title was misleading, and sug- d that future articles should be headed t Up and Work." The suggestion comes a restless, energetic spirit, quite differ- in character from the home-staying onse Karr whose most entertaining book nally provided the title.

e have just turned back the clock and the evenings are again with us. It is the time to set forth on our travels, and we in the hope that they will be as enjoy- and fruitful as our previous trips, for resulted in a number of long-lost plants restored to our gardens. Among them uite a few which have been laureated by Royal Horticultural Society, and there are al that have not yet reached flowering , though they are here, so proof of the om of the late Canon Ellacombe, who d strongly that a list of all good plants lost ought to be prepared and efforts e to restore them to cultivation, is now rent.

t us first go to Chili. At this season it ought to be pleasant, and here we may assist Mr. Clarence Elliott in his search for Balbisia verticillata, which is beautifully figured in the "Bot. Mag." at tab. 6,170. It is shrubby in habit, and bears very large golden yellow Fremontia-like flowers. It was originally introduced by Messrs. J. Veitch and Sons, and is the Flore de San Jose of the Chilians. It grows at about 10,000 feet altitude in both Chili and Peru.

In volume one of "Flore des Serres," there is figured the handsome Alona cœlestis, an attractive sub shrub, with very large bell-shaped blue flowers. There are several figures of this fine plant in the older books, and one can well imagine the interest this would create when before the Royal Horticultural Society Floral Committee.

In volume ten of the same work there is shown an illustration of Viola cappilaris, the seeds of which came by accident in the soil accompanying some Chilean plants which arrived in Belgium as far back as 1855. It looks a gem for the rock garden, a stiff, erect little plant, adorned with about 20 small round-shaped blue flowers like a near relative of the Spanish V. arborea.

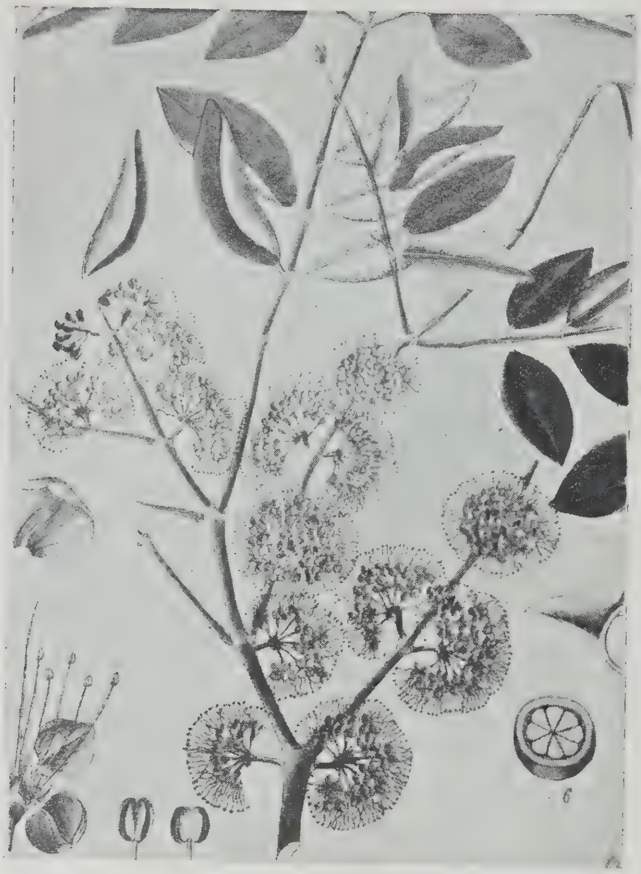
From Chili we must get to Colombia, that paradise of the Orchid hunter, though we will leave the opulent cultivators of these plants to do their own collecting. Here grows Cupanea grandiflora, a plant that would be certain to create some stir. It looks from the figure in volume five of "Flore des Serres" like a giant Gloxinia set on long stems. The immense flowers are white, thickly spotted with pink—a most noble member of the Nat. Ord. Gesneracea.

Then there is Chaetogastra Lindenia, the most resplendent of plants. Its portrait in volume ten of "Flore des Serres," tab. 1,011, should be inspected, it will make us all more determined to secure seeds. Its flowers are of rich, deep crimson, elegantly disposed on stiff branches, altogether a superb plant, inhabiting a very inhospitable region at a high elevation. It should require little in the way of heat or protection.

South America is so rich in plant treasures that one might linger there with profit over many days, but as there is much ground to travel we will only make one more stop to collect seeds of the lovely variegated-leaved Alstromeria argenteo vittata. This curious plant originally came from the neighbourhood of Rio, and would be well worth re-introducing, for there are among us gardeners who love the curious as well as the beautiful and this Alstromeria ought to please both. It is figured in volume fourteen of "Flore des Serres."

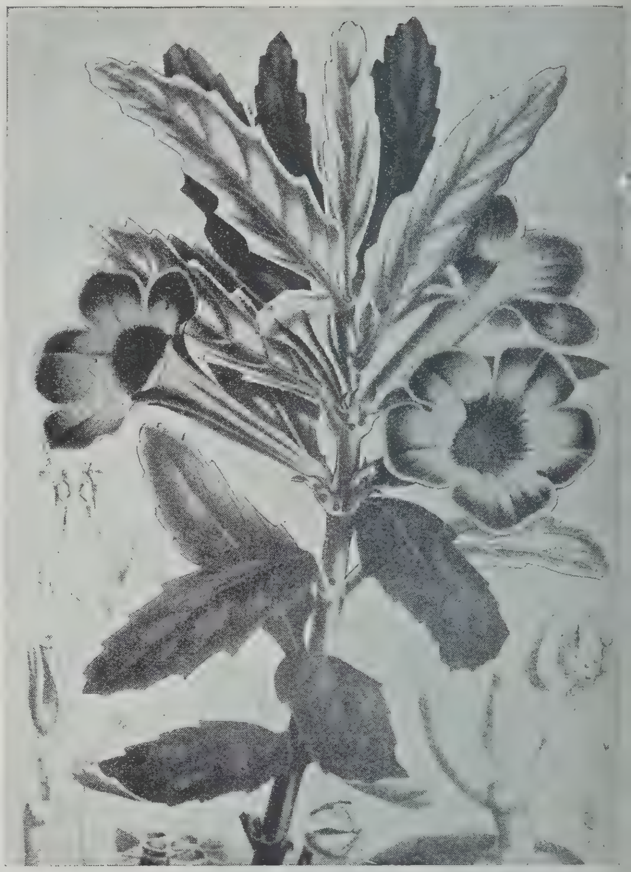
From South America to the United States—for here those that insist on their plants being hardy will assuredly find them.

It will not be possible to quote illustrations



Memecyton tinctorium, a singular looking shrub bearing clusters of lovely blue flowers

From Wight's "Illustrations of Indian Botany"



Pterodiscus speciosus, a stove plant with handsome red flowers

From "Bot. Mag." for 1844

of what we want in the States. Whether they exist or not I cannot say until the new Pritzel can be consulted. We must, therefore, depend on the descriptions to be found in the "Floras." We will separate and each will collect his favourite genera. Utah must be visited, for in the desert there is to be found Arctomecon Mirriami, a pretty Poppywort with lovely foliage and yellow or white flowers. Its seed pod is remarkable, and it is the only Poppy with persistent petals. Seeds of this ought to be at once forwarded to Burford, for Sir William Lawrence has provided an ideal site for this plant in his new desert garden.

A look out must be kept in Utah for Pentstemon Parryi, one of the gems of this fine family. The "Floras" only give as a habitat for Lathyrus ornatus "the foothills of the Rockies." A glance at the map will show that this means a considerable walk, but this Pea is said to justify its high-sounding specific name well.

In the Yosemite Valley is to be found Lewisia Yosemitana, said to be the most attractive member of this lovely genus. Another plant that ought to be in cultivation is the white flowered form of Gilia Californica, which is occasionally found among the masses of the typical pink or rose, but it is rare even in its native home.

In Idaho there are many lovely Mertensias. Some of the Alpine species are very small and dainty, particularly M. pulchella and M. Horneri. There are many good things in Idaho.

In Dakota there are silvery leaved Lupins of great beauty. Pentstemon grandiflora is plentiful there and Rumex venosus, which the botanists describe as more like a choice Begonia than a Dock, should also be collected.

From the United States to the Neilgherry Hills—for here is to be found a rare treasure in Lysimachia Leschenaultii, perhaps the most beautiful member of the genus. The writer in "Flore des Serres," who describes this plant, becomes enthusiastic over it, and refers to it as "encore une plante d'élite." It bears large heads of brilliant carmine flowers, and the plant is beautifully figured in volume ten.

In Wight's "Illustrations of Indian Botany," volume one, tab. 93, there is figured a singular-looking plant named Memecyton tinctorium, a shrub bearing lovely blue flowers in clusters like a well flowered Ceanothus. It is a genus I have never seen, and Wight refers to them as being very beautiful, and wonders why they have never been introduced into gardens and shrubberies. They might not be hardy here, but it seems a most desirable plant for the greenhouse.

In Royle's handsome volume, "The Botany of the Himalayan Mountains," with its superb plant portraits, there are several most desirable plants figured, chief among them is, perhaps, Gentiana coronata. If any Gentian exists as fine as this species here referred to, it is clear that G. sino ornata and G. Farreri are not the last word in this family.

In this volume is also figured Thermopsis barbata, a handsome plant, which we have had occasionally in our gardens, but it seems hard to keep. However, with so many keen and skilled cultivators this ought again to be tried.

Primula elliptica holds on to its precarious life here with great difficulty. This little beauty no doubt languishes for want of company. A large bag of seed to ensure the raising and planting of broad groups is what is wanted, and no doubt it would then soon feel at home and be happy.

From India to the Cape—for we have become greedy with regard to South African flowers, remembering such splendid recent arrivals as Venidium fastuosum, Ursi the wonderful scarlet Gazania, bri Arctotis, the lovely Heliophilas, Monso and a host of others. Many more still a us there, and one very desirable pla Pterodiscus speciosus, pictured in the " Mag." for 1844. In that year it flo at Knowsley in the stove, but that wil worry us as many plants were in those grown in the stove that are now known to be quite hardy. This Pterodiscus h tuberous root. It looks handsome bot flower and foliage, and the "Bot. M writer says of it: "Rarely has a desirable plant been added to our collectio

It is really almost a waste of tim describe the plants of South Africa; ther so many that are desirable in that lan colour and sunshine. We have just beg revel in the wonderful composites. Ther Arctotis, Dimorphothecas, Helioph Gazanias, etc., still to be gathered that amaze and delight many plant lovers. I Aus district there grows the red or pink of Venidium, and somewhere, according t botanists, there is a purple flowered Gaza

We have now had a good look round covered considerable territory, but it is al certain that in our party there will Rhododendron enthusiast who may rea ably complain that nothing has been don his favourite genus. It might be argued he ought to be content with the 800 (o species he has already obtained from Ch but that is perhaps asking too much, s will sail home by the Gulf of Carpenta anchoring there to allow a visit to M Bellenden Ker, for, perched high on mountain is Australia's only Rhododendr R. Lochæ. From the figure in Bail "Catalogue of Queensland Plants," this not look a very exciting species, but it is to be expected that the Rhododend collector will be happy until he gets it.

Notes from a Cornish Garden

ECENTLY I have seen something of Bournemouth, its chines, and one or two of its gardens; and Bournemouth worst, for all the grass was brown from of rain, and many of the shrubs and some of the trees moribund.

e soil, they tell me, is very bad, and the nce of streams in the chines, coupled the scarcity of broad-leaved trees, would it difficult to establish the various lovely es of Rhododendron, which would add uch to their beauty. It could, I imagine, one, especially if they were planted in mber and were treated to a good mulch ives and dead sticks for the first two or years; and a group of the blue stinii and the yellow ambiguum or trin, species which stand drought better their large-leaved relations, would be rious sight in the spring. But ignorance e part of the municipal authorities will ably prevent its realisation for, at any some years to come. Whilst staying , I had the privilege of seeing a most esting garden beyond Dorchester, on the orne Road. Surrounded by the chalk l sides, the owner is fortunate enough to a large pocket of green sandstone l his house, and there are grown all ler of trees and shrubs which could not on either side. Magnificent Cedars and atic Beeches form the background, and iced some good specimens of the grace-imalayan Picea morinda.

haps the most notable plant in the n was a 27 feet high Rhododendron neri, which had made a shapely tree, howed its brown trunk and bright peel-ark to perfection. There was a very fine of R. campylocarpum, as good or better any in Cornwall, and a number of well-n Thomsonii, all of them of flowering Maples were another feature, just being to take on their autumn colouring; should be perfectly gorgeous in another or two, whilst there were beds of as brought from Japan, and, at frequent als, Cherries from the same source, looked the picture of health, and were ng good growth. Among several sorts agnolia, M. parviflora was conspicuous, was bearing a large number of its long, fruits. Then I was shown many beds ining Rhododendron seedlings of st's and Rock's collecting, and was ed to find that among them R. sinole, crassum, one of the Boothii series, num, and even a giganteum had stood s. of frost last winter. Some of the Boothii e undoubtedly much hardier than the plant, but eriogynum and still more teum are certainly tender, and their val was something of a revelation. With e respect, I should say that, like most e Cornish gardens, it was somewhat rowded, especially with Beech trees. nyone who has had that problem to face s how very difficult it is to remove even ig tree without doing untold damage. and truly those of us who have old-ished gardens to deal with, and who se starting a collection of Rhododen-, should take a very long view ahead, hardening their hearts, make a drastic nce before ever they begin to plant. his is a counsel of perfection, often im-le to carry out, and complicated by the f letting in too much sun and wind.

urning home, I found we had had ful rain, and, thanks to the heavy soil, ydrangea flowers were as good as usual, h I hear that in some Cornish gardens have almost entirely failed. In my ce, the men had cut and taken up a big Laurel, which was smothering my old plant of Rhododendron nobleanum album, and left me a nice space of open ground within sight of the drive and fairly sheltered.

There are many candidates for a home there. Eucryphia pinnatifolia is one, Rhododendron discolor x auriculatum another, and I think R. Cleopatra (Blood red arboreum x Thomsonii x sutchuenense), R. Thomsonii x xenosporum, R. Souliei x discolor, and R. xenosporum x Gilian will have the remaining places, as they all have flower buds, and one is anxious to place them where they will be seen.

But there are bigger plants near by requiring a move, such as 5851 F, a good form of R. irroratum; R. Atalanta, which is a cross between Werei and Thomsonii; R. Smirnowi x Aucklandi, and a pale blue form of Augustinii with green spots, all of which are clamouring for a place, and since my staff is all too limited, and the plants weighty, I fancy they will have the preference and the smaller ones be relegated to the Oak wood, where, alas, it is a long journey to see them.

Among these big plants, however, there should be room for a certain number of smaller plants, now too crowded, but which can later be moved without undue exertion. Several young Griersonianum are indicated, the beautiful hose-in-hose R. Daphne, which is dark red, and named after Lady Weymouth; R. neriiapo (neriiflorum x apodectum), bright red and dwarf; and several plants from a wire enclosure, such as hypolepidotum, saluenense, rupicolum, and a couple of hybrids from this, not to mention half a dozen dichroanthum.

I should like to include Osmanthus Forrestii, since it is a fine thing, and in this garden Rhododendrons are apt to be overdone, but I don't know how large it grows, and it is probable that it won't bear transplanting. In fine, my little bit of spare ground is giving me a lot of fun in theory, whatever the outcome of it may be. And as I write, the men are removing another large Laurel a little further down, so that with any luck most of the more important plants will find a home, including, perhaps, a fine specimen of R. neriiflorum, at present crammed into an inadequate corner between a 25 feet Embothrium and the path down from one of the nurseries.

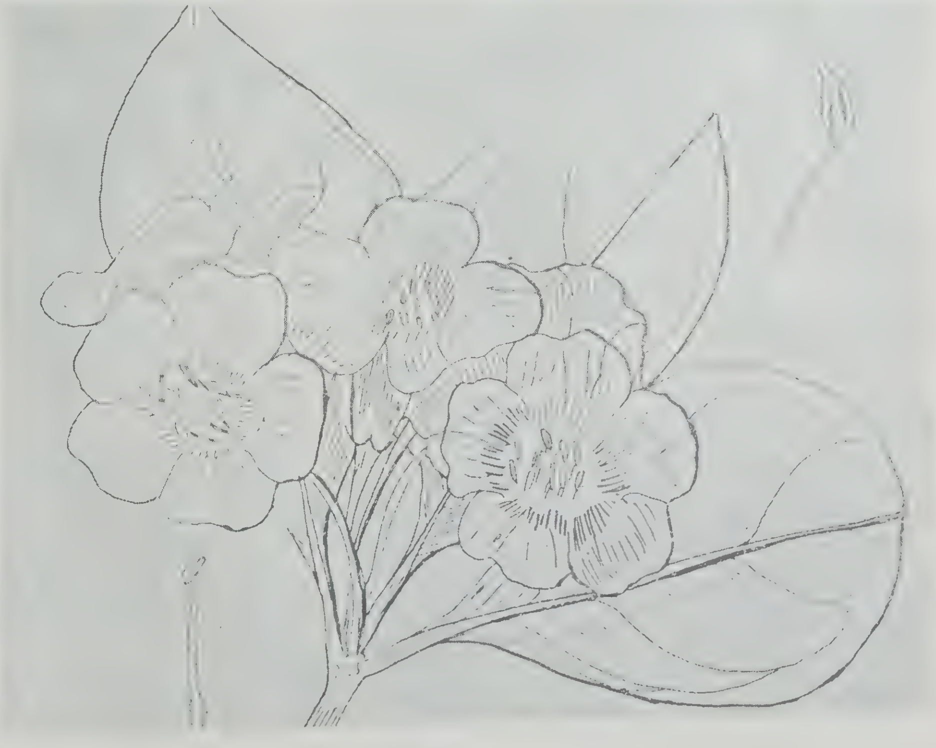
Propagating scarce Chrysanthemums

Some of our finest varieties are very shy at producing cuttings, so any that appear from now onward should be secured whenever they get to a decent length. Clean 3-inch pots filled with sandy compost are very suitable for the purpose, three to five cuttings being inserted round the edge of each. Give a good watering to settle the soil, and then set closely together, either on an ash bottom or in shallow boxes which have 1 inch of sifted leaf-mould in the bottoms.



Sit down and travel: Australia's only Rhododendron R. Lochæ

From Bailey's "Catalogue of Queensland Plants"

The Points of a Rock Garden, and some ways of achieving them

By B. H. B. Symons-Jeune

PART I.

ROCK gardening has reached a stage in its development where it becomes essential that certain facts and limitations be recognised. Confusion, criticism, and uncertainty are already existing, whereas recognition of requirements, and certain uncontroversial facts in obtaining them, would go far to help development.

The requirements for a rock garden fall automatically into two groups. In Group 1 plants are the main consideration. In Group 2 the site is to be developed in such a way that a picture of permanent beauty is formed, irrespective of season. Beautiful stone is used, beyond the needs for merely growing Alpines, which would quickly hide it. Each type of garden has its merits, but they are different merits, and must be judged differently, or neither will get justice.

Now, confusion arises by trying to show plants in a "natural" setting. It must be clearly understood and remembered that there can be no third group. Either the rock must be built to suit the plants, which will inevitably mean joints that are false to natural rock, and weaknesses where there would be strength, or the rock must be built to suit the site and then planted. The first alternative, therefore, belongs to Group 1 and the second to Group 2. Both groups can have many plants; in No. 1 more, but less attractively shown; in No. 2 less, but more attractively shown.

I will outline the important points to consider in making either formation, but before starting I want to check the growth of two very present and universal fears which will, I hope, later on, upon consideration of the points made, be finally shattered. The fears are for too much rock (and consequent expense) and for too few flowers. The first can be dismissed for the moment and proved later by saying that the more skilled the builder the less rock proportionally will he use and with better effect.

The fear for too few flowers is important, and is caused by misunderstanding. Rock gardeners of the old school, while using quite as much or more stone in the aggregate, do not grasp the idea underlying the new and "natural" type. When they see (and they often have to judge) stone put without regular "comfortable" pockets for planting, they assume, too readily, that there is no room
for plants. The visible pockets to which
are accustomed are partially illuminated

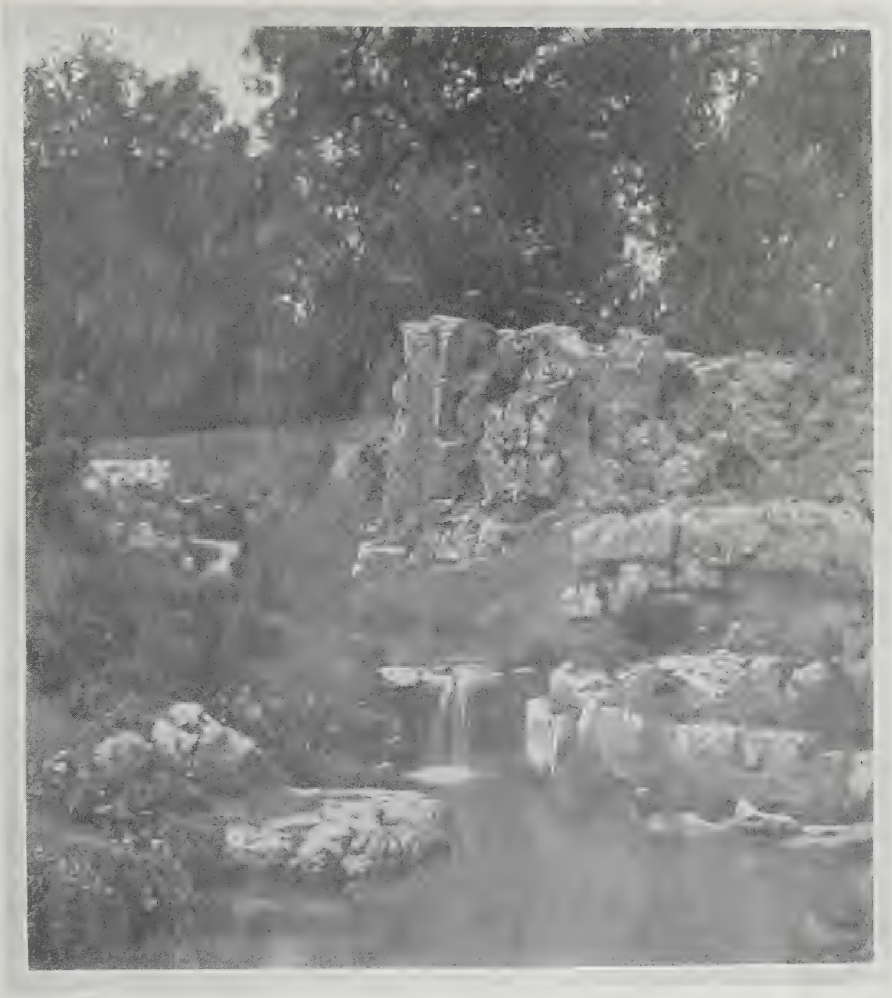
It will, also, especially if it stands clear, give scope for autumn and winter effect.



Watershed in relation to rock

This rock garden contains 28 tons of stone only

To achieve such a picture, and to judge it, the chief points to remember are :—

1. A natural appearance and disappearance of the rock, and not too much of it. It should be mellowed on top, with no feeble or jagged points.
2. The proportion of vigour and plain surface, as made up of rock, shrub, and open spaces.
3. The correct placing of shrubs, on or near the rock, (*a*) in shelter, (*b*) in exposed places, (*c*) for contrast.
4. Planting for harmony and aspect.
5. Treatment of open spaces, turf, stone chippings, and plants for them.
6. A correct and suitable watershed in relation to the rock.

Finally, an arc, with the summit resting on the strongest rock, should contain all rock within that particular outcrop, whether described from back to front, or from side to side. Prolongation, of course, in any direction, after an interval of space, requires a separate arc.

In the next article I will elaborate these points, especially in regard to the use, and abuse, of turf.

A garden pond

In some gardens there is to be found a pool of water, fed, perhaps, by a small streamlet. Often it is quite neglected as regards beauty, and only used as a place to obtain water for the garden, yet there are numbers of wild plants that would turn the whole into one of the most attractive features in the garden. If the ground is miry near the pond, it could be planted with the tall, pink Willow-Herb, and near the water there could be a fringe of Bulrushes. In the water, Water-Lilies could be planted that would quickly spread to the banks, with perhaps a plant or two of Arrow-Leaves. In the streamlet flag Irises would look well and make a fine display with their bright flowers in their season. Along the banks of the streamlet could be planted the wild Forget-me-Not, which is very rich and bright, the fine blue of the flowers being seen a long way off. Many flowers when they grow near water are much brighter, such as the Meadow-Sweet. The wild Garlic should certainly be planted for its white flowers,

F. H.

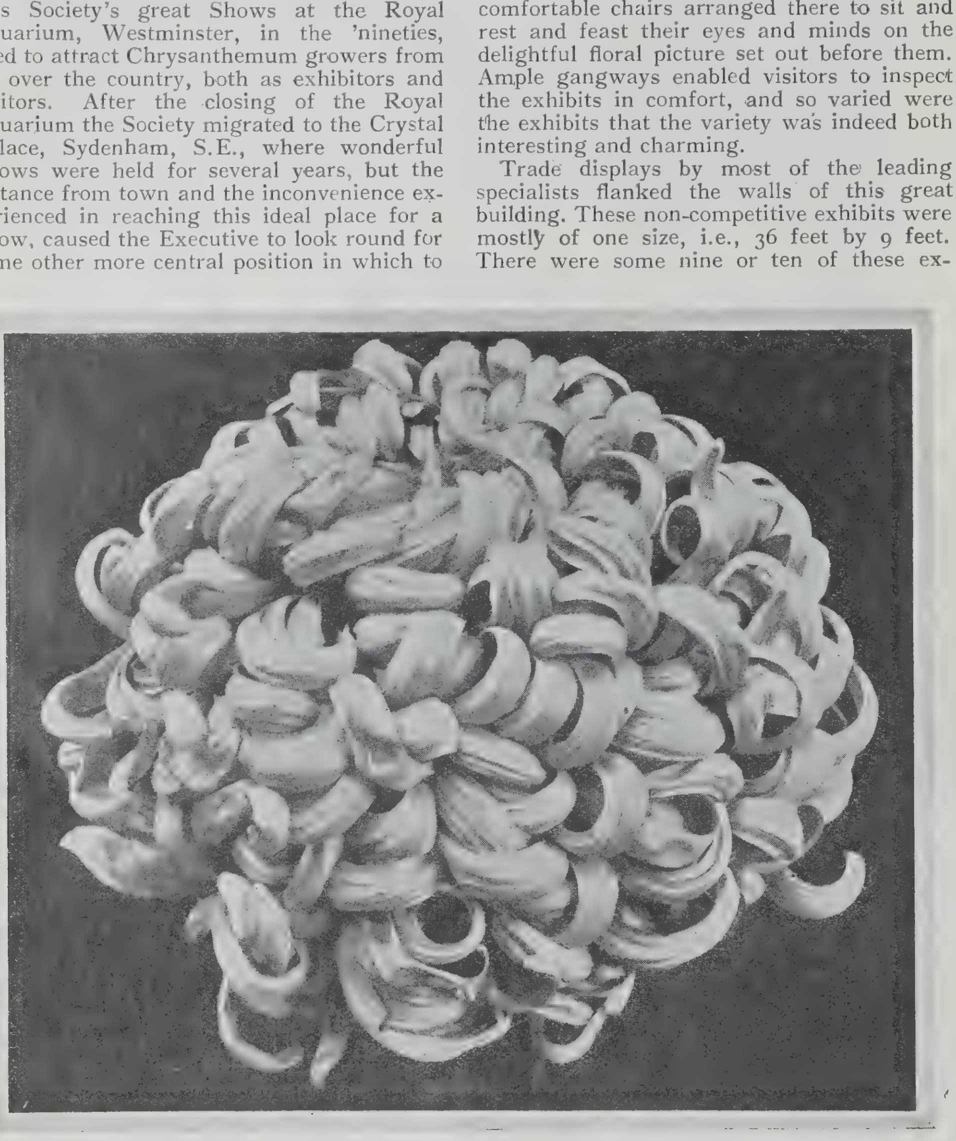
Edging to flower beds

Lift and divide those of a more or less permanent nature at the present time, and replant in entirely fresh ground, for although some plants will form a dense mat and remain healthy in this condition for several years, others die off in patches during a spell of drought unless changed every few years. A few nice plants to form such edgings include the grey-leaved Veronica incana, a pretty plant, Helichryssum bellidioides, Geranium lancastriense, Gypsophila Fratensis (pink), G. prostrata (white), and G. prostrata dubia (pink), Campanula muralis, C. carpatica pallida, C. turbinata, C. garganica hirsuta, Œnothera riparia, Gentiana lagodechiana, G. acaulis, Thymus serphyllum in variety, and Sedum Ewersii.

NATIONAL CHRYSANTHEMUM SOCIETY

A GREAT SHOW

THE Annual November exhibition of this special Society has always been regarded as one of the great horticultural fixtures of the year, right away from the time when this Society's great Shows at the Royal Aquarium, Westminster, in the 'nineties, used to attract Chrysanthemum growers from all over the country, both as exhibitors and visitors. After the closing of the Royal Aquarium the Society migrated to the Crystal Palace, Sydenham, S.E., where wonderful Shows were held for several years, but the distance from town and the inconvenience experienced in reaching this ideal place for a Show, caused the Executive to look round for some other more central position in which to hold their Annual Exhibition. A suggestion was made that negotiations should be entered into with the Royal Horticultural Society with the object of entering into an arrangement in future to hold the Society's Annual Exhibitions in the Hall of the R.H.S. in Vincent Square, Westminster, S.W. Happily, to the mutual satisfaction of both Societies, terms were satisfactorily arranged, and from that time until the present the great Annual Show of the Chrysanthemum has been held at Vincent Square. This year the use of the New Hall at Greycoat Place was requisitioned, but there was just a little trepidation lest the Hall could not be satisfactorily filled. This fear was quickly dispelled when one visited the magnificent exhibition held in the New Hall on November 7th and 8th last. The building was just comfortably filled with a display that will always be regarded with pleasure and satisfaction, as the exhibits were mostly arranged with considerable taste and skill, and there was no crowding, as has been the case in so many Shows of the past. The view from the steps at the south-western end of the building was indeed beautiful to behold, and many visitors took advantage of the comfortable chairs arranged there to sit and rest and feast their eyes and minds on the delightful floral picture set out before them. Ample gangways enabled visitors to inspect the exhibits in comfort, and so varied were the exhibits that the variety was indeed both interesting and charming.



Mr. K. Luxford's novelty Rise of Day, a very large buff coloured exhibition bloom

First Class Certificate

Trade displays by most of the leading specialists flanked the walls of this great building. These non-competitive exhibits were mostly of one size, i.e., 36 feet by 9 feet. There were some nine or ten of these exhibits, and they made an excellent framework to a really beautiful display. Messrs. H. J. Jones (Ryecroft Nurseries), Ltd., Lewisham, S.E., and Messrs Keith Luxford and Co., Sawbridgeworth, Herts., both received a large Gold Medal for their exhibits. The former had one of the most finished exhibits this firm has ever staged. Here were to be seen grand blooms of Japanese, such as Mrs. Gilbert Drabble, Miss Ada Ellis, W. Rigby, Daily Sketch, and Red Majestic. Large, neat, and ever incurved sorts, such as Captain Kettle (crimson-red, tipped golden-buff), Monument (white), Decoratives Jean Pattison, and a number of good Singles, such as Molly Godfrey, the new Rose Molly, Susan, Rona, and May Edwards. There was a charming series of Pompons also. Messrs. Keith Luxford and Co. staged a grand group of well-finished blooms of a most representative character. Here were to be seen large stands of well-grown exhibition Japanese handsome Singles, dainty Pompons, and a
capital lot of well-grown Decorative vari
This was a splendid effort and well m
the distinction it gained.

A heavy lot of exhibition Japanese bl
and a host of good Singles and Deco
varieties gained a Gold Medal for The K
Acre Nurseries, Ltd., Hereford. This w
impressive group, which lost a little b
character of the smaller flowers arrang
the front; nevertheless, it was a
display.

A Gold Medal was also awarded to M
G. Vinten, Balcombe, Sussex, for a u
display of well-grown decorative and m
Chrysanthemums. The blooms wer
markable for their finish and rich and
colours, and they represented most o
better sorts at present in cultivation. Si
such as Phyllis Cooper, Grenadier,
Golden Seal and Decoratives Jean Pat
Blanche du Poitou, Uxbridge Pink, a
host of other good things were in eviden

A most noteworthy exhibit which gai
Gold Medal was a representative grou

it was a great pity this group was
arranged on the floor.

Silver-Gilt Medals were awarded to M
Woolman, Shirley, near Birmingham,
Mr. W. Wells, Merstham, for h
meritorious groups, both of which contri
materially to the beauty of the Show.
Medals were won by Mr. W. Ya
Maidenhead, for Decorative Chrysa
mums, and to Mr. J. W. Cole, Peterbor
a similar award was made for a capit
hibit. To Mr. W. Hatch, Cookham,
Maidenhead, a Silver-Gilt Medal
awarded for a large collection of abou
distinct sorts of early-flowering Chrysa
mums, cut from plants grown by him
nurseries in the trial of early sorts und
auspices of the National Chrysanthe
Society during the current year; this
lection was most interesting.

Generally speaking, the competitive c
were well filled, and the quality of the flo
left nothing to be desired.

There were two exhibitors in the Nat
Competition open to Affiliated Societies,
again the Finchley Society succeede
carrying off the Challenge Trophy. All
of the flower in this splendid display we
high quality, which indicates a splendid
of comradeship amongst that Society's
bers. The Borough of Croydon Chrysa
mum Society were placed third, although
had a really beautiful lot of blooms.

In the open classes, from which the
were excluded, for cut blooms, the chief
was for 36 Japanese blooms in t
varieties, three blooms of each, arrang
vases. There was a capital entry; le
honours were won by Mr. Duncan Cam
gardener to the Dowager Lady An
Holdenby House, Northampton. He
good examples of the following varie
Birmingham, Mrs. Peter Murray,
Mary, Miss Ada Ellis (grand), Red Maj
Victory, Mrs. A. Holden, W. Rigby, Du
of Westminster, Majestic, Aquitania,
Yellow Majestic. Mr. C. Beckett, gar
to the Hon. Sir John Ward, K.C.

erford, was a good second. He has grand blooms of the new yellow Chas. and W. Rigby.

Chas. Beckett had some compensation gain winning the Holmes Memorial enge Cup for 36 Japanese blooms, ct. This requires a great effort. The ies shown represented most of the better newer Japanese sorts, and they did the r much credit. A competition of more ordinary interest was that for an experi- al class for big blooms, comprising 12 ese sorts, distinct. The blooms were ged on show boards provided by the ty, the holes to receive the blooms being ged 10 inches apart, from centre to e, thus providing more space than the ation boards permit. There were five l exhibits, first prize being awarded to D. Cameron, who was supreme at this He staged magnificent blooms of ampton, Miss Ada Ellis, Julia, Mrs. G. ole, Birmingham, Golden Champion, Majestic, Mrs. Algernon Davis, Queen , Mrs. B. Carpenter, Majestic, and a. The blooms were seen to great ad- ge on these larger boards, and the ex- ent must be regarded as a complete ss.

interesting class was that for one vase ree Japanese blooms of one variety, . There were six good exhibits, Mr. eron winning leading honours with iful examples of Mrs. G. Drabble. With l blooms of Louisa Pockett, Mrs. H. er, gardener to Lady Juliet Duff, was d second. A similar class for one vase crimson variety was won by Mr. M. A. son, gardener to Mr. J. H. Platford, church, who showed beautifully finished ns of Birmingham. There were no fewer nine entrants for a similar class for three nese blooms of one variety of a yellow r. Mr. Cameron was again first with b examples of Princess Mary. Mr. ham, The Gardens, Greenlands, Henley- hames was second with Yellow Majestic, Mr. Curran, third, with Shirley Gold. ere were also nine exhibitors in the class for three Japanese blooms of any other colour than white, crimson, or yellow. Grand examples of T. W. Pockett won first prize for Mr. Johnson, praiseworthy examples of Majestic and Red Majestic winning second and third prizes respectively.

The principal class for incurved blooms was for 18 blooms, three blooms each, six varieties, staged in six vases. There were three good exhibits, but first prize and The Holmes Memorial Challenge Cup was won by Mr. G. Curran, Nottingham. Beautifully finished deep blooms were set up in this class, showing the following varieties at their best: Romance, Percy Wiseman, Ondine, Mrs. Bryce, Percy Dove, and Progress. In the second prize exhibits there were splendid blooms of Frank Trestian, Monument, Mrs. J. P. Bryce, and Godfrey's Eclipse.

The competition for six varieties of Devonshire Chrysanthemums found five entrants. First prize was awarded to Mrs. Winterbottom, East Grinstead, for very bright and pleasing examples of Uxbridge Pink, In Memoriam, Freda Bedford, Mrs. R. Felton, Jospehine H. Bernier, and Jean Pattison.

The classes for Singles were numerous, and, without exception, were one of the chief features of interest of this great Show. In all the open classes that well-known grower of Single Chrysanthemums, Mr. A. Robertson, gardener to Mrs. Yarrow, Abbey Road, St. John's Wood, as invincible. Each of his many exhibits served to show this charming type of flower at its best, and he can well take credit to himself of being the most successful grower of his time. Mr. Robertson's exhibits in the classes respectively for nine vases of large Singles, distinct, six vases distinct, and The George Monro Challenge Cup Class for 12 vases large Single, distinct, were triumphs of cultural skill; all the blooms were large, of good colour, and superbly finished. It may be well to mention a few of the more outstanding varieties; they were: W. Knight, Rita, Molly Godfrey, Mrs. G. Palmer, Susan, Reginald Godfrey, Robt. Collins, Rona, Bronze Molly, Sportsman, Isobel Felton, Fusilier, and Audrey. Competition in these classes was good. Mr. H. Woolman also showed Single sorts in splendid form and condition. Another successful exhibitor of Singles was Mr. Joseph Cheer, gardener to Mr. H. E. Miller, Purley. A new feature in this year's show was a class for a display of Cut Decorative Chrysanthemums, arranged on a floor space 10 feet by 6 feet, height not to exceed 7 feet. The use of natural cut foliage, grasses, or berries and foliage plants in pots was allowed. The result was not very satisfactory, but the first prize display was interesting. It consisted of a central stand of yellow Japanese blooms, and two smaller stands of Singles. There were also other stands of decorative sorts, and with the addition of Crotons and other foliage plants, this display was an easy first. The second prize exhibit contained a large number of big exhibition Japanese blooms and foliage plants, arranged in a very formal manner.

The Decorative side of the exhibition was very poorly represented; there were, of course, here and there, a few brilliant exceptions to this rule, but, generally, they were very poor. The table Decorative class was re-instituted on the present occasion, but the exhibits were very disappointing. Pompons were poorly represented, except for the first prize exhibit in the leading class. Thirty years ago Pompon Chrysanthemums used to be exhibited in ideal form and condition; there is room for much improvement in this section. On the whole, however, the first show of the "National" in the New Hall was a great success.

Window-boxes

The London Gardens Guild is organising a special campaign to popularise window-boxes. The first step in this is to be a lantern lecture on "The Construction and Cultivation of Window-boxes." The lecture will be given at Prince Henry's Room, 17, Fleet Street, on Tuesday, November 26th, at 8 p.m., by Mr. W. Stewart, N.D.H., Superintendent of the Royal Hospital Gardens.

REMINDERS FOR THE WEEK

Southern and Midland

Forcing Asparagus

A low house or heated pit will be found quite satisfactory for the forcing of Asparagus, so long as there is sufficient depth to admit of fermenting material (such as dry leaves and fresh stable manure) being firmly packed in to a depth of 2 feet or so beneath the soil, which should be about 3 inches. The roots may then be stood close together over the surface and covered with leafy soil. Water thoroughly to settle the soil well among the plants, and maintain a night temperature of 55 degs.

Rhubarb, Chicory, and Seakale

Lift a few roots of each, and, after clearing away all leafage likely to decay, plunge them up to their collars in ordinary garden soil, water thoroughly, and maintain a temperature of about 55 degs. A light dewing overhead should be applied occasionally if there is a tendency to dryness, a warm, moist condition being essential, and on no account allow the temperature to fall below 45 degs. at any time, otherwise the Seakale will blacken and fail to respond.

Cauliflowers

Cauliflowers not sufficiently advanced for cutting should be lifted and heeled in in a house or frame, where they may be protected from frost, as these are rather valuable and worthy of a little extra care.

Broccoli

In cold districts it is advisable to heel these over towards the north, and protect their stems, either with soil or litter.

Protective material

Have a quantity of this placed in readiness in case of need to spread over Celery, Celeriac, and other vegetables liable to damage from severe frosts.

Digging and trenching

Vacant plots must now receive attention where large areas have to be dealt with, and if these have been manured as advised in a former calendar such work should no longer be delayed. It is a good practice to select a certain area each year for double-digging or trenching, as the effect of this upon future crops is most beneficial.

Vineries and Peach houses

Light, at this season of the year, is of the utmost importance, and where plants are growing beneath the former, no harm will arise from the partial shortening back of all lateral growth. If the leaves of Peach trees have a tendency to remain, a new besom drawn over them carefully in the same direction as the branches will dislodge them and admit both sun and light, to the great advantage of the plants beneath.

The flowering house

This should now be gay with quite a variety of flowers, and these will remain in a fresh condition longer if excessive fire-heat is avoided, 45 degs. to 55 degs. being ample; the former is to be preferred to a dry, fiery atmosphere.

Poinsettias

Until their scarlet bracts are well advanced these handsome plants require a fairly brisk temperature, and are best accommodated in the stove or forcing house, and within reasonable distance of the glass. Low temperatures will cause the lower leaves to fall, but with the bracts well advanced, such may with advantage be given.

Early-flowering Chrysanthemums

These cannot always be relied upon to winter safely in the open, and those which do are usually late in sending up desirable shoots for cuttings. It is, therefore, advisable to lift a few plants of each variety and place them in pots or boxes, and then cuttings will be strong and plentiful. If this is not possible, light litter of some kind should be placed around their crowns and between the rows as a little protection from severe frosts.

Propagating hardy Heaths

Cuttings of those not actually in bloom, inserted in sharp, sandy soil and kept beneath a bell glass will root in due course if put in at the present time. Some of the tree Heaths respond very well, but one, Erica Australis, is, in my opinion, the most difficult of all, and a grower is fortunate if he roots 20 per cent. of his cuttings.

Hardy Primulas

Those which have been raised from seed and pricked off into beds should now be planted out in cool, and preferably moist positions. Failing this, the soil should be deeply dug and liberally manured in order that the plants may be sustained during a period of drought. These mostly revel in cool, moist soil, but a few are quite satisfactory in average beds and borders.

Roses

Reduce all long growths to half their length to prevent rocking to and fro by rough winds, as this causes holes to form around the base of the stem, which, in heavy soils stands full of water for days to the detriment of the plants. Unwanted growths on pillars and arches should be treated likewise. All Roses in beds are pruned finally here in November, with very satisfactory results. This admits of the beds being forked over and replanted with dwarf undergrowth. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The herbaceous Calceolaria

These are very hardy, but damp is apt to do considerable harm to the foliage if left out too long, so it will now be advisable to move them to a cool house where frost cannot reach them and from which excessive humidity can be driven. As little fire-heat as possible should be used, as this plant cannot thrive in a warm, dry atmosphere. Vaporise the house occasionally to keep the plants free of insect pests. The soil should never be permitted to get really dry, remembering however, that a sodden condition at the roots is equally harmful.

Greenhouse Primulas

None of these require much in the way of artificial heat, providing frost is absent and damp not troublesome, but a nice buoyant atmosphere should be aimed at, and every care taken to exclude frost and prevent the ravages of damp. Careful watering always pays, and never more so than during the dull, short days of mid-winter. A little gentle feeding will help to improve the size and quantity of flower, but this must not be overdone.

Early Roman Hyacinths

These, if potted up in good time, will by now have filled the pots with roots, so may be taken from the plunge and set for a few days, either in a cold frame or a cool house. After this they should be moved into genial warmth, so as to stimulate growth. If required as cut flowers, do not set too close to the glass, but those to be used in pots wi much sturdier and with straight, firm st if kept as near as possible to the light.

Rose planting

Providing the soil is in good working o the pushing forward of this work is desirable so that the roots may have chance of obtaining a hold of their quarters before really cold weather sets Do not omit the firm treading down of soil over the roots.

Plant bush fruits now

As with Roses, endeavour to have all p ing carried out when the ground is in working condition. Gooseberries, Red White Currants, and Brambles succeed where the soil has not been recently dr with manure, but Black Currants and R berries revel in liberally manured soil rather damp nature.

The pruning of bush fruits

This should also be pushed forward all speed during suitable weather conditi Unless wanted for cuttings, all prun should be gathered up and burned as soo possible. The surface between the bu should be lightly forked over some time be spring.

Planting the larger fruits

Apples, Pears, Plums, Cherries, Apricots may all be planted during the of the month, and all of them thrive bes ground that is not unduly rich.. If farm manure is given to these fruit trees at p ing time, only rank, unfruitful growth result. Cherries, Apricots, and Plums sh have some old lime mixed with the soi which they are planted.

Latest Beetroot

If this crop is still out, it should be go at once, for hard frost affects it, and may put in an appearance at any time n

Manuring the garden

In these days of shortage of this valu material it is all the more necessary to a what is available with judgment. The sit any crops that will succeed fairly well with manure should be well dug, but nothing m Gross feeders, like Celery, Leeks, and Onio must have generous supplies allotted to th while kinds that require only a mode quantity should have their preference g effect to. When all this is understood acted upon, much finer results are fo coming than is possible when all are tre alike.

Ordinary digging

Single-spit digging is sufficient for qui number of both flowers and vegetables, bu should be thoroughly carried out, and spade driven in as far as it will go. The wh surface should be left rough and lumpy, that the elements may get a chance to verise and sweeten the soil to some cons able depth.

Double digging

This is probably the most satisfa method known for preparing ground for great majority of crops, especially if it only been single dug over a series of ye To trench under such conditions is to br to the surface the inert, unfertile subsoil which most plants would refuse to thr but if double-digging has been practised a few years, the second spit can, with per safety, be brought to the surface, its previ treatment having brought it into a state q suitable for plant life, while its freshness a further asset. C. BLAI

Preston House Gardens, Linlithgow.

Bignonia venusta

is beautiful climber was grown in a cool house from cuttings sent m South Africa six years ago. The tubular flowers, about 2 inches g, are of a bright shade of orange. Shown at a recent meeting of the H S. by Mrs. Maria Pope, Ashwick Hall, Marshfield, Chippenham.

Brasso-Lælio-Cattleya Queen Elizabeth

A bold and beautiful hybrid shown by Baron Schröder, Dell Park, Englefield Green. Colour orchid mauve, with yellow in its wide fringed lip. Very fragrant and of unusual dimensions. First Class Certificate.

v certificated Chrysanthemums

O fewer than 29 novelties were submitted for award on this occasion. Each of the undermentioned varieties received uch coveted distinction of a First-Class ficate.

Moffatt.—(See illustration). A promis- ingle, about 5 inches in diameter. The s are fairly broad, neatly reflexing, build- a bloom of good form. Colour, light nut. Shown by Mr. W. Turnham, The ens, Greenlands, Henley-on-Thames.

llow Monument.—A beautiful yellow from the well-known white incurved ty Monument, partaking of the beautiful ved characteristics of the parent variety. n by Mr. Thos. Stevenson, Hillingdon.

ames.—A promising exhibition Japanese, g long, fairly broad florets, drooping and g, building a bloom about 9 inches in eter. Colour, pink, with whitish centre. n by Mr. H. Woolman, Shirley, near ingham.

vern.—Another large exhibition Japan- with broad, reflexing florets, building a of good quality, about 9 inches across. r, dull red, with buff reverse. Also n by Mr. H. Woolman.

imson Model.—A pretty Single, about hes in diameter. Florets, of which there everal rows, are fairly broad, and develop om of good form. Colour, ruby-crimson. n by Mr. G. Carpenter, The Garden, Hall, Byfleet.

Hebe.—Another beautiful Single, about 6 inches across. The florets are broad and of good substance, and build a flower of excellent form. Foliage small, and stem stiff and wiry. Colour, deep red, with faint white base to a nice golden disc. Shown by Mr. H. Shoesmith, Jr., Mayford, near Woking.

Lucifer.—A useful addition to the Decorative section. The florets are fairly broad and pointed, and develop a bloom about 4½ inches in diameter. Colour, rich crimson. Good stem and small foliage. Also shown by Mr. H. Shoesmith, Jr.

Florence Bighart.—This pretty Japanese bloom of decorative form recently received an Award of Merit of the R.H.S. The florets are fairly broad, and build a bloom of reflexed and drooping form. Colour, canary-yellow. Shown by Mr. H. Shoesmith, Jr.

Rise of Day.—(See illustration). A very promising exhibition Japanese bloom, having very long, broad, loosely incurving florets, building a bloom 9 inches to 10 inches across, and about 6 inches deep. Colour, buff. This is sure to be freely exhibited in subsequent years. Shown by Messrs. Keith Luxford and Co., Sawbridgeworth.

D. B. Crane.

Trollius or Globe Flower

In the late spring and early summer the Trollius, or Globe Flower, gives to the garden a glory of yellow and gold. There is scarcely a soil in which it will not thrive, and even where it is not quite suitable, it may be made so with little trouble, a reason why (should you not grow them) they ought to be seen in your borders. It is well known that however exposed the locality may be, or however hard the winter, they come through unscathed with next to no protection. Some thirty clumps in our own garden braved the rigours of last winter, and, except they are rather later than usual in flowering, they have come as strong as ever. Trolliuses will grow in quite common soil, but do best when planted in that which is deep and contains a certain amount of humus in the way of rotted manure or old refuse from the garden. You may plant the clumps in a sunny position and be sure of having the earliest blooms, but they will do equally well on a cold north border, and, though later in flowering, continue the longest in beauty. They are delightful plants for the back or middle row of a border of hardy plants. If you have an opportunity of seeing some plants in bloom note how strong they are if they have been in their present quarters a year or two. In adding a few roots to your borders this autumn—a convenient time to shift them, being November—you will not do wrong, as, once planted, they give little trouble, only needing root division every two or three years. The following varieties are among the best of this family:—Fire Globe, semi-double, deep orange; Gibsoni, yellow, with black centre; Orange Globe, light orange; Excelsior, large yellow; Asiaticus, large orange; sinensis, yellow, with orange centre, having long and divided petals.

W. F.

From Gardening Illustrated

Fifty Years Ago

The prevention of disease in Potatoes

IN the spring of 1865, when living in Devonshire, I adopted a plan for the prevention of disease in Potatoes which resulted in a fine crop entirely free from disease. My neighbours could not be induced to change their old method, so their crops were more or less diseased. In 1866 I planted three rows, each 35 feet long, adopting the old system, in the same garden, situated about 20 feet from the main crop. On taking up the Potatoes I found that the general crop was quite free from disease, but the three rows were attacked. These results appeared to me a most convincing proof that the new method of cultivation was a preventive of the Potato disease, so that ever since, when I have had sufficient land to grow a crop, I have followed the same plan, and always with the same happy result.

In your last number your correspondent "C." states that some gardeners have tried a plan (which is similar to mine), but gives no details for cultivation; I therefore send you particulars of the method I advocate, and I shall be very pleased to learn through GARDENING ILLUSTRATED the result from those who may try my system. The distance between the rows must be 2½ feet; whole Potatoes to be planted, and in drills not deeper than 3 inches, as more earth will afterwards be thrown over them, and they will thus keep drier. In May earth the plants up as usual. In July bend down the haulms horizontally across the furrow to the right, all the plants to lie one way, earthing them well over, so as to prevent them from rising again, leaving about 8 inches to 10 inches of the upper portions of the stalks exposed. The earth to be taken from the furrow on the left hand side. This operation must be completed on no account later than July 10th. The upper portions of the stalks are thus left drooping into the furrows. Care should be taken not to break the haulms; 15 inches to 18 inches should separate each plant. The rows should be always due north and south. I may state in conclusion that the best time for planting Potatoes, main crop, is the last fortnight in March or the first fortnight in April, a little earlier or later, as the spring may be forward or late, or the ground dry or wet.—HENRY MIMARDIERE.

—*November 15th*, 1879.

The planting of "stone" fruits

Speaking generally, Apricots, Cherries, and Plums must be given the protection of a wall when planted north of the Tweed. Apricots and Sweet Cherries are best, as a rule, on south walls, although the latter sometimes do well with a western exposure. The Morello Cherry is one of the few things that does really well when facing north. Plums may have a southern, eastern, or western position and do well, but the finer sorts are best on a south wall. Incorporate a fair amount of old mortar with the soil when planting these fruits, and avoid fresh manure.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plan*
be named should send fair examples of each
stem, leaf, flower, or fruit. (Snippets of l
and points of shoots are useless.) Not more
four plants should be sent in any one week b
same correspondent. Where more than one
is sent they should be numbered. Of conifer
cones should always be sent.

Naming fruit—*Several specimens in diff*
stages of colour and size of the same kind gr
assist in its determination. Single, unripe
deformed specimens are difficult to name.
do not undertake to name more than
varieties at one time.

FRUIT

Apple propagation

(Experimenter).—Nearly all commercial varieties of Apples are budded or grafted upon a root stock. The root stocks of commerce are broadly divided into two groups:—(1) Free stocks, so called because the resulting trees are vigorous in growth and suitable for standard and half-standard trees. (2) Dwarfing stocks, or Paradise stock. Dwarfing because the variety worked thereon does not grow so vigorously as it does on free stock. Dwarfing stocks are, in the main, used for bush or cordon trees, but some of the more vigorous dwarfing stocks will make a good half-standard tree. At the present time two types of stocks are grouped under the term "free": (A) Crab stocks raised from the pips of the wild Crab. (B) The old free stocks, which are raised from the pips obtained from Cider pummace. The former are preferred by many as being more reliable. The chief drawback with free stock is the liability to variation, although in the hands of a good nursery firm this liability is very largely cancelled out by selection. It will, of course, be realised that all Apple stocks raised from seed are liable to show much variation with regard to vigour. The so-called Paradise stocks are at the present time all raised vegetatively, *i.e.*, by means of cuttings, suckers, and layers; mainly the latter. When stocks are reproduced in this way the material is standardised. During the last decade our two Fruit Research Stations, East Malling and Long Ashton, have collected all the Paradise stocks in commerce and classified the material so obtained. Each stock that showed commercial ability was given a number, and its behaviour watched. The work of classification is now complete, and there is available a definite stock which can be raised vegetatively, and therefore does not vary to any great extent, suitable for most purposes for which Apple trees are required. Space prevents our giving all the stocks in detail. In brief, the Paradise stocks are grouped into four classes: (1) Very Dwarfing Class—an example of this is Malling Type IX., Jaune de Metz. This is suitable for many varieties of Apples worked as cordon trees, and for bush Apples in cases where small trees are required. Apples worked on this stock come to maturity quickly. (2) Semi-dwarfing Class, *e.g.*, Malling Type II. This stock is in great demand for bush Apples. Apples worked on this stock require from 10 feet to 20 feet of space according to the variety worked thereon. (3) Vigorous Class, *e.g.*, Malling Type I. The true broad-leaved English Paradise. Apples worked on this must be given from 12 feet to 30 feet of space according to variety. Half-standard Bramley Seedling worked on this stock will require most of the 30 feet indicated above. (4) Very Vigorous Class, *e.g.*, Malling Type XVI. This stock appears to be as vigorous as the free stock, and has the advantage of being
easily propagated by layers. For full d
of these and other Apple stocks you s
read the Ministry of Agriculture's pu
tions and the Annual Reports of the Res
Stations at East Malling, Kent, and
Ashton, Bristol. For the techniqu
budding and grafting you should obtai

eased Apples and Pears

Discolour).—Your Apples and Pears are ected with Brown Rot, a disease which, in n, attacks flower, shoot, and fruit of oles. The only control for this fungus is cut away and burn all dead wood from the e. Diseased fruits should be collected and ned, especially those mummied fruits ich sometimes remain attached to, or lie eath, the trees. Give the trees a thorough aying with lime sulphur at winter ength just before the buds break into wth next year. Only one Pear was cted. All the Pears appear to us as though y were taken from the tree a little before y were ready. With certain exceptions, rs should hang on the trees as long as sible.

FLOWER GARDEN

um pardalinum

. M. L.).—The Panther Lily loves a , light soil enriched with plenty of ded manure and leaf-soil, partial shade, ter from bleak winds, and plenty of sture during its growing season. Given , it is not only one of the most beautiful es of California, but one of the easiest of ure and increase. Your plants are in l of fresh soil and nourishment after ng been in one place so long. We ad- you to lift them at once, divide them up, cting the finest bulbs, and transplant on , deeply dug, and enriched soil. The season has not been in their favour.

irrhinum Asarina

I. M. L.).—This Italian is a sun-lover, makes an excellent plant when used on all or ledge. It is possible that someg is attacking your plant at the collar, or the soil is unsuitable. You might try splanting it to a more sunny position, also put in a few cuttings, striking them frame so as to enable you to try it next on in more than one position.

a Conqueror

Constant Reader").—So far as we can e out, there are only two varieties of that come anything near to your detion of Conqueror, these being Phyllis ett and C. W. Waters. We trust these meet your requirements.

Brigid Anemones

rs. Y.-B.).—Anemones like a rich, fairly , well-drained soil enriched with wellred farmyard manure. Your cold, chalky does not seem suitable for the successful ration of these flowers. You would ably have more success growing them on d beds with a good dressing of manure into the soil, and a crop of seedlings d be raised each year to take the place y failures.

nia Willmottiana wanted

Donovan).—We regret to say that after most extended search we have been unto find anyone offering this rare plant. very doubtful whether it can be procured gh the trade to-day.

ny buds failing to mature

A. L.).—With further reference to your ule, which was probably due to dryness at oot and watering with liquid manure e in this dry state. The soil for Pæonies d be trenched 2 feet deep and enriched farmyard manure, following which no manure should be given for at least two r, when, if the plant has become vigors, such assistance may be given with advantage. However, we would give your plant another trial, but cease applying liquid and give at the present time a heavy mulch of well-decayed farmyard manure, leaving this on the surface until growth commences in spring, when it should be pointed in.

Tulip bulb damaged

(W. R. Y., Cornwall).—No, all you have done is to damage the early leaves, which, as a consequence, will be only half their proper length. The flower is still dormant in the heart of the bulb.

GREENHOUSE

Chinese Sacred Lilies

(Various Readers).—The Chinese Sacred Lily is an eastern variety of Narcissus Tazetta (N. Polyanthus), and is also known as the Joss Lily. Bulbs imported from Northern China can be had in flower six weeks from planting. Half fill a bowl with shingle, adding sufficient water just to cover this. Place bulbs on the shingle and surround with pebbles. Keep receptacle in the dark until growth begins, then transfer to the light. It is advisable to change the water weekly, and the same should be tepid. Suitable pebbles can be purchased from most bulb merchants, one quart being sufficient for three bulbs.

TREES AND SHRUBS

Pruning Berberis

Kindly tell me how to prune the following:—Berberis polyantha, brevi-paniculata, Autumn Glory, B. Wilsoniæ, and when it should be done. They have made so many young shoots this year the fruit is almost hidden. E. G. H.

[All the kinds you mention should be slightly thinned by cutting out a few of the oldest and weakest branches from the very base of the bushes; this done, survey the bushes and remove any heavy cross branches which tend to shut out light and sun from the centre of the bush and thus encourage an open, airy, and shapely form, after the manner of a large fern. Do not tip the branches, as this only results in a dense growth and robs the bush of its natural and graceful form. The soil in which your plants are growing has been made too rich, hence the exuberant growth; a medium soil on the poor side is the best for these, the branches then, almost without exception, being laden with gorgeous fruit. This may be done at any time after January.]

White and yellow Jasmine congested

(A. Woolsey-Butler).—Both should be severely thinned in spring immediately the yellow species have ceased to bloom; when, in addition to thinning of the branches, exuberant and weakly growth may also be shortened back to any extent. In future, prevent your plants from becoming a tangled mass by pruning annually about the end of March, as when so treated the result is extremely beautiful, both kinds providing an abundance of lovely graceful sprays of bloom, which are highly desirable for cutting.

Pernettyas not fruiting

Kindly advise me if there are any means by which I can bring some Hybrid Pernettyas into fruit, planted in peaty loam, moist conditions at root, not shaded. The bushes, about 3 feet in height, grow well, are healthy, and are covered with blossom which fails to set. Two others were bought last season, and one has fruited. The others we have had three years or so. W. J. O.

[A moist rich soil is necessary for these beautiful berry-bearing shrubs, and the presence of both sexes. The trouble you complain about often arises from plants growing in too dry a position, the roots getting dust-dry at a time when moisture is most important. This is not the only trouble, however, as unless male and female plants are planted together the plants fail to fruit. We advise you to obtain a male plant from the nursery, allowing one of the latter to 12 females, and this may produce the desired result. To make doubly sure, you might obtain a plant in fruit and plant it among some of your own, as it is by no means certain which of the sexes you at present possess, and this should help you to clear the matter up.]

Romneya Coulteri with strong offshoot

(M. B.).—The suckering which you describe is quite characteristic of this handsome Poppy when growing in a free soil, and the writer is familiar with an instance where, planted at the foot of a brick wall, it has run beneath the foundation and formed large clumps on the opposite side. This, however, only occurs in free soils. You will not injure the parent plant in any way by removing the shoot, which may be transplanted at any time. These do not, however, always survive, and we advise you to place a little sharp sand about the base of the shoot when transplanting, and give slight protection from frost.

CHRYSANTHEMUMS

Leggy Chrysanthemums

("Dorset Duffer").—Unfortunately, you omit to state to which section of the Chrysanthemum race the varieties belong of which you complain. Also, whether grown for exhibition or for home decoration. Anyway, we fear that you have been overdosing with chemical manures, and nothing can now be done to improve matters for this season. If you will tell us which varieties you favour and the purpose for which you grow them, we will gladly give you full, practical hints on how to proceed another year.

MISCELLANEOUS

Lawns

The tennis courts have suffered very much from the drought this year, with the exception of the "lines," which are for about a foot wide of a lovely green colour. We have noticed this every year, but this year it is wonderful. The soil is very heavy, with blue clay not far away. My theory, for what it is worth, is that the whitening used in marking out in the same place every year has sweetened the soil, therefore allowing the grass to root deeper and to stand the dry weather better. My employer suggests giving the courts a coat of slacked lime. Would that answer, please, or would it burn the grass or make Clover grow, which are both to be avoided? Perhaps you could tell me what whitening is made of, and if ground chalk would answer as well. The chalk near here is grey. Used for cement would that be as good as white chalk? DODYOR.

[Your observations on the effect of the application of whitening to your lawn should give you a valuable clue as to the future treatment of the whole area. Whitening is a form of calcium carbonate, or, in other words, common chalk, and if you apply chalk you should be able to obtain the same effect all over the lawn. We suggest that you use ground limestone or one of the commercial forms of calcium carbonate, which are on the market, at the rate of 1 lb. per square yard over the whole area. This material should be applied at once. Slaked lime would do the same work, and you would only need to use ½ lb. per square yard of this material. You will, of course, realise that lime or chalk is very apt to encourage

Clovers on a lawn, and the presence of Clover slows down the pitch considerably, and is not looked upon with very much favour by lawn tennis players. On the other hand, your first problem seems to be to get your grasses growing and an application of lime will do this. Afterwards if you find Clover troublesome you can easily get rid of it by using either sulphate of ammonia or a good lawn sand. If the Clover is troublesome later on write to us again.]

Tennis courts

Kindly advise me on the treatment of six lawn tennis courts which I am in charge of as a groundsman. Last season I was advised to manure them with a dressing of lime and earth, but, to my mind, they have looked very poor. They are now looking fairly green, but full of worm casts. Since the play stopped, the base lines are very bare, and I am afraid no grass will grow again. Would you please advise me on a manure suitable for sowing now, and what quantity for six full-sized tennis courts, and whether I sow seed on bare places or returf? Your advice will be very much esteemed.

Geo. H. Soper.

[It is difficult to advise without seeing the courts in question, as the condition of turf varies so much under the local conditions which obtain. On general principles the first thing to do will be to clear up the worm trouble by applying a good worm-killer. This material should be applied according to the maker's directions. The bare patches are more difficult to deal with. If the lawns do not get a lot of wear, sowing down the bare patches would probably be sufficient. When the lawns receive hard wear the only satisfactory way of dealing with bare patches is to returf. All groundsmen should make the practice of having a turf nursery from which turf can be lifted to returf bare patches. The material from the bare patches should be replaced in the turf nursery and sown down. If this system is carried out there is always a supply of turf available for patching. The resown material will have to stay in position for two years before it is in a fit condition to lift for patching purposes. Your grass seed mixture should be made up of good, hard-wearing grasses, and the mixture should contain 10 per cent. of Agrostis stolonifera. The whole area of lawn should be dressed in April with sulphate of ammonia at the rate of 1 oz. per square yard.]

Waterlogged tennis court

I should be very grateful if you could help me with a plan for draining a tennis court, which is so wet that it is almost unplayable. The court lies below a slope of rough grass; above the grass slope is a small stream which runs parallel to the tennis court. We are practically certain that most of the moisture which appears on the tennis court penetrates from the stream and through the rough grass slope. Most of the drains on the court have been taken up and examined.

An old, broken drain was discovered running from the stream, nearly down on to the court. When this was blocked up, a marked improvement on the court was noticed, so it is possible that there are other drains coming from the stream. The court was probably added about 15 years ago to an old garden.

A friend has suggested the following plan for getting rid of the water which comes from the stream.

A narrow drain should be dug the whole length of the court, sloping from each end towards the post; at the post a square hole should be dug; both the drain and hole should be filled with clinkers (2-inch screened), and then that a socketed drain should be made right across the court, to convey the accumulated water to the field. The soil is clay. If you think this plan practical, I would be very glad if you could tell me: (1) How wide and how deep the clinker drain should be, and what should be the fall to the centre?

(2) How big the hole for the clinkers in the centre should be?

(3) What should be the fall of the drain across the court, and how large the pipes for it should be?

(4) How much clinker should be required? I should be most grateful for any hints or suggestions.

We have only taken Gardening Illustrated for the last three months regularly, and find it most helpful and interesting

(Miss) M. B. Debenham.

[The suggestion made by your friend is quite a good one as far as it goes. We would, however, advise you, while adhering to the original suggestion, to lay a 3-inch land drain along the bottom of the trench before filling in with 2-inch clinkers, breeze, or stones. The trench should be 10 inches wide and 18 inches deep at each end, with a fall of 6 inches to the centre, in each case discharging into a small bricked catch-pit, 3 feet deep by 14 inches square. Leading off from this we recommend a 4-inch socket drain to convey the water to the field. The land drain pipes should not touch each other, ¼ inch, at least, being allowed between each pipe to allow of access of water. We consider that a small catch-pit is preferable to a hole filled with clinkers, as you can inspect the drains conveniently from time to time, and there will be less possibility of them choking at the junction. The fall across the court for the socket drain should be 6 inches. You do not state the length of your lawn which is to be drained, therefore, we are unable to say how much material will be required, but if you allow for 1 yard of clinker to each 12 feet run of trench you will be near the mark. We presume there is a reason for not allowing the drain to discharge at one end of the lawn, otherwise a gentle fall from end to end with an easy bend would have prevented you cutting through the centre of the lawn and rendered the catch-pit unnecessary.]

NAMES OF PLANTS

Constant Reader, Bristol.—3, Polygonum vaccinæfolium.

William E. Cox.—1, Centaurea rogusina; 2, C. gymnocarpa; 3, C. Clementei; 4, Cineraria maritima.

Mac.—Cydonia Maulei, a dwarf Quince from Japan.

L. S. O.—Polygonum Baldschuanicum.

Superintendent.—Chrysanthemum leucanthemum plenum.

E. M. Burn.—Specimen insufficient. Please send when in bloom. It may be a Wulfenia.

F. P., Stafford.—Heuchera Rosamunde.

A. M. B.—Clethra alnifolia, native of Eastern N. America. Deciduous, growing 5 feet to 6 feet in height. The flowers, creamy-white, open in August, and the seed-vessels, when ripe, are brown. The plant is quite hardy.

L. W.—We regret to say that the flowers of the Zonal Pelargoniums sent by you were all knocked to pieces when they reached us. The white is probably "Vestal."

NAMES OF FRUITS

W. F. C., Cornwall.—Pears: 1, Beurré Bosc syn. Calebasse Bosc; 2, Beurré Hardy; 3, Marie Louise.

D. R., Barry.—1, Lemon Pippin; 2, Ribston Pippin; 3, King of Tomkins County; 4 and 5, labels mixed. Large fruit Hambling's Seedling, smaller fruit Margil.

J. R., Colchester.—1, Ben's Red; 2, Striped Beefing; 3, Beauty of Kent; 4, A
Elizabeth.

F. N., Sussex.—1, Mother; 2, Go
Noble.

"*Aln.*"—1, Stirling Castle; 2, Braml
Seedling; 3, Cockle Pippin.

"*Wellfield.*"—8, Allen's Everlasting;
Cox's Orange Pippin; 35, Mere du Men
42, Pear Brown Beurré.

W. K., Berks.—1, Mere du Menage
Golden Noble; 3, Lord Hindlip.

Constant Reader, Bristol.—1, Coronat
2, Beauty of Kent.

Betty Sibley.—Striped Beefing.

Taunton's Excellent Show

Taunton held an extremely successful s
last week. This was the 15th annual
hibition, and the entries on both the f
and decorative sides exceeded those of
year. The number of challenge cups
trophies was much larger than on prev
occasions.

Mr. F. W. Penny secured a first for
vase of singles in the show. These were
Robert Collins variety (bronze), and took
special Gold Medal offered by Mr. W.
Loosemore.

Outstanding success among the exhibi
was scored by the Lady Abbess, Franci
Convent, Taunton. In the first four cl
for Japanese blooms the Convent gard
(Mr. P. Fawle) swept the board, taking
firsts and three Challenge Cups, also the
Medal for the best bloom in the show, a
white blossom of the Mrs. A. Brown var

Mr. Penny also did well in the amate
division, obtaining the Challenge Cup for
highest number of points awarded in s
classes. The Silver Vase offered for the
prizewinner in the 12 blooms class (amate
exhibit) went to Mr. C. E. O. Hamme
Langport.

Mr. Guy Turner, with a collection
Japanese Chrysanthemums in pots, too
Silver Cup.

Mr. W. H. Pease (Tiverton) was the
successful exhibitor in the open classes
Pears and Apples, and won not only
Silver Challenge Cup for highest points,
also the Gardening Illustrated Medal.

Among the trade displays Mr. R. J. C
of Staplegrove Nurseries, received the pre
award. New and other outstanding blo
in his exhibit were Bob Greenfield, a
old rose variety; Enid, a red bloom, suff
yellow; Mrs. E. L. Andrews, buff-apr
shaded bronzy-red; Red Molly, a deep
chestnut-red; and Rose Molly, a deep
(single varieties); and Albion, white; E
Beauty, bright crimson; Enton Sun
striking bronze; Golden Wonder, a
yellow; and Mohawk, Indian red (do
varieties).

The outstanding varieties in the exhibi
Mr. H. Clarke, of the Greenway Nurse
Taunton, were Iolanthe, a double of stri
pink; Rose Molly, a deep rose colour (sing
Miss Higley, an excellent single for s
work, of salmon-bronze; and the
Anemone Centre variety, of several colo
Mr. Clarke's display was awarded a
Medal.

Similar honours fell to Sutton and S
Reading, for a stand of wonderful qu
Potatoes; Jarman and Co., Chard, fruit
Chrysanthemums; Allwood Bros., Hayw
Heath, Sussex, Chrysanthemums.

Selecting seeds

ing in " Commercial Varieties of
bles for New York State," bulletin
blished by the New York State College
iculture, at Cornell University, Ithaca,
H. W. Schneck says that seedsmen's
ues list over 15,000 so-called varietal
of vegetables, while probably 500
s would suffice for all important com-
l needs. In fact, listing 36 crops sug-
for New York markets, he enumerates
o varieties. Thousands of the names
the 15,000 are synonyms ; many others
names of distinct varieties which are
worth.

thing similar exists in regard to flower
the standardisation of which various
sations are attempting to effect. Some
practically every trade convention is
to nomenclature, and the American
ation of Nurserymen and the Society of
an Florists have standing committees
enclature, which present their reports
annual gatherings. The publication
ver-increasing acceptance of " Stan-
d Plant Names " is in a line with the
of the trade to simplify plant
cation.

the organisations of florists, nursery-
nd seedsmen, the Vegetable Growers'
tion of America is active in an effort to
dise the names and varieties of their
ts, according to Mr. Schneck. To help
ork vegetable growers assure them-
f a supply of good seeds, he suggests
practices, some of which are readily
ble by florists, particularly.

suggestions follow :—

udy many catalogues and question
en closely.

2. Deal chiefly with houses of established reputation, trying new ones with caution.

3. Seek to know the source of seed, not so much for climatic influences as for care in breeding, growing, and handling.

4. Buy seed as near the source as possible and, if possible, from the originator, the introducer, or the houses that have specialised in improvement and maintenance of good stocks of a variety.

5. Ask for stock numbers, so that seed of the same parentage may be bought if results are good.

6. When feasible, buy seed a year in advance and subject it to field trial.

7. Do not buy primarily on a price basis.

These suggestions are worth consideration by any florist, for every grower knows that the first essential in producing good stock is planting reliable seeds. No matter the care lavished on the plants germinated from inferior seeds, the crop cannot be A-No. 1 stock. For it is still true that " a silk purse cannot be made from a sow's ear."

"Herbs of Healing"*

Wild flowers have an attraction all their own, and indeed popular interest is often awakened as to their uses. It is to the ancients that we owe a great deal of the knowledge that has come down to us about herbs, also the knowledge that has been handed down from generation to generation about the curative lore of these plants. Our early ancestors discovered that herbs were extremely useful insomuch that they contained medicinal qualities which would alleviate ailments without the skill of a more qualified practitioner. The truth of this is outlined in the book " Herbs of Healing," which gives a short description in non-technical language of some of the best-known English herbs, and with the aid of the photographs enables a reader to distinguish with ease the true from the false.

The Latin name of each herb is given, together with the name by which the herb is generally known, and a brief outline of the curative properties is added. In the arrangement of the book botanical sequence has been followed, thus bringing related plants together, and the index enables any plant to be found in the text by means of its customary name. A very fascinating work for those interested in herbs.

Birmingham Gardeners' Association

The Birmingham and Midland Counties Gardeners' Association is an active organisation under the Chairmanship of Mr. J. Smith, the Superintendent of Birmingham City Parks and Cemeteries. A very excellent syllabus for the winter and spring, 1929-30, has been prepared, which includes some attractive lectures at the local Chamber of Commerce on arranged Monday evenings. The Secretary is Mr. P. G. Catt, The Lodge, Westbourne, Edgbaston.

OBITUARY

MR. JOHN EDWARD MASON

His numerous friends in the horticultural world will learn with regret of the death of Mr. John Edward Mason, a Director of Messrs. Joseph Bentley, Ltd., the well-known firm of chemical manufacturers, which took place on the 1st inst. at his residence, Barrow House, Barrow-on-Humber, Lincs.

HE "WALDRON"
BEL HOLDER
(Registered No. 742063).

This label-holder retains all the advantages of the good old-fashioned wooden garden label —cheapness and convenience —while eliminating its great drawbacks.

It is indestructible.
It cannot rot off.
It cannot be cut off by the hoe.
It cannot be worked out by the frost.

It holds an ordinary wooden label firmly and clear of splash.

The label is clearly visible, and can be easily changed so that the holder may be used year after year.

Neat and unobtrusive in appearance.

It is made of zinc and galvanised steel.

KELWAY'S PÆONIES.
NOW IS THE TIME TO PLANT
KELWAY'S LOVELY SWEET-SCENTED ENGLISH PÆONIES.

Autumn and early Winter are the best seasons for Pæony planting. Send at once for fully descriptive illustrated Catalogue of the most up-to-date collection in the world.

Collections of named varieties, the selection of sorts left to Kelway & Son, from B 18s. per dozen to F 100s. per dozen. Collection C, double and single flowered fragrant varieties—white, cream, blush, peach, rose, amethyst, cherry red, crimson—strong plants guaranteed true to name, 24s. per dozen, 50 for 90s.

KELWAY COLOUR BORDERS
OF HARDY PERENNIALS
should now be planted.

They are labour saving and permanent adornments of the garden, and a never-failing source of interest to the household and visitors, as well as providing cut flowers. Colour Borders are "our own invention," and every one we design is different. Please send us a small sketch of your garden with dimensions, soil, and aspect, and we will quote at once.

"——— Lane, Hampstead, N.W. 3.
8th October, 1929.

"The collection of plants for my border arrived in most excellent condition. I have planted them according to the plan, and if they do not thrive it will be my own fault or that of the climate, for one could not wish to see a more vigorous looking set of plants."

KELWAY & SON, Hardy Plant Specialists,
LANGPORT, Somerset.

DAFFODILS, Tulips, and other Bulbs. Illustrated list will be sent on application to—THE WELSH BULB FIELDS, St. Asaph.

ROSES, PHLOX, HERBACEOUS PLANTS.

Roses in 1929

spite of the dry season, this has been exceptionally good year for Roses. The nmer crop was excellent, and the n display has been equally fine. There a sprinkling of bloom in November, e frost that put an end to the flowering of the Dahlias was not severe enough down the Roses. Nowadays there to be no such thing as "the Last Rose nmer," such is the prodigality of blos- of modern Roses. This free-flowering, tive type is now by far the most popular.

CH IS THE FREEST FLOWERING ROSE?

may seem a difficult question to , but I have no hesitation in that Gwyneth Jones is one most continuous and most ous Roses we have. It nces to bloom in June, and sually in bud and blossom rost puts an end to all out- owers. We can safely ex- om it five months of con- s flowering. I have three trees of this variety, and oduced hundreds of blooms. of times I have removed sful of faded flowers, while y more have been cut for lecoration. The early crop variety was, during the ason, the best I have ever give. The vivid colour ere, together with more s and shapeliness in the than one generally expects. ce mulch of cow manure, with a few inches of soil, with which I top- my Rose beds in spring to have suited the thinly oses of the Gwyneth Jones nd perhaps accounted in vay for the quality of the owers. Speaking of top- g, I find this a good to counteract the ravages k Spot. By renewing the soil there is practically no any disease spores reach- plant during the growing Last year all my trees of iety Cherry were badly at- with Black Spot and were before the autumn was er. This year the same rowing in the same posi- e unaffected, and they are n at the present time. All soil surrounding the trees moved in the spring, a mulch of manure was spread around them, and new soil from the vegetable plot was put on. Los Angeles, W. F. Dreer, and others that are subject to Black Spot can be grown successfully by the same treatment.

WHICH IS THE BEST OF THE NEW ROSES?

Now, this is a really difficult question to answer, but I am inclined to think that few new Roses will give such general satisfaction as Mrs. Sam McGredy, which is being sent out this autumn. It has been consistently good with me all the season, and I would even go so far as to say that it is the best variety that I have grown. The colour description is scarlet-coppery-orange flushed with Lincoln red. This is as accurate as words can convey. There is some of that wonderful colouring that made Mme. Edouard Herriot such a sensational novelty when it was first introduced, and yet it is not like Herriot. Probably if you take a bit of Herriot's colour and mix it with some of Emma Wright's, with a splash of scarlet blended in them, you will not be far from the true shade. The blooms are beautiful in the bud and half-open stage, and the open flower is sufficiently well built to give it grace when full blown. It is a good grower, very free, and the foliage is a handsome dark bronzy-green.

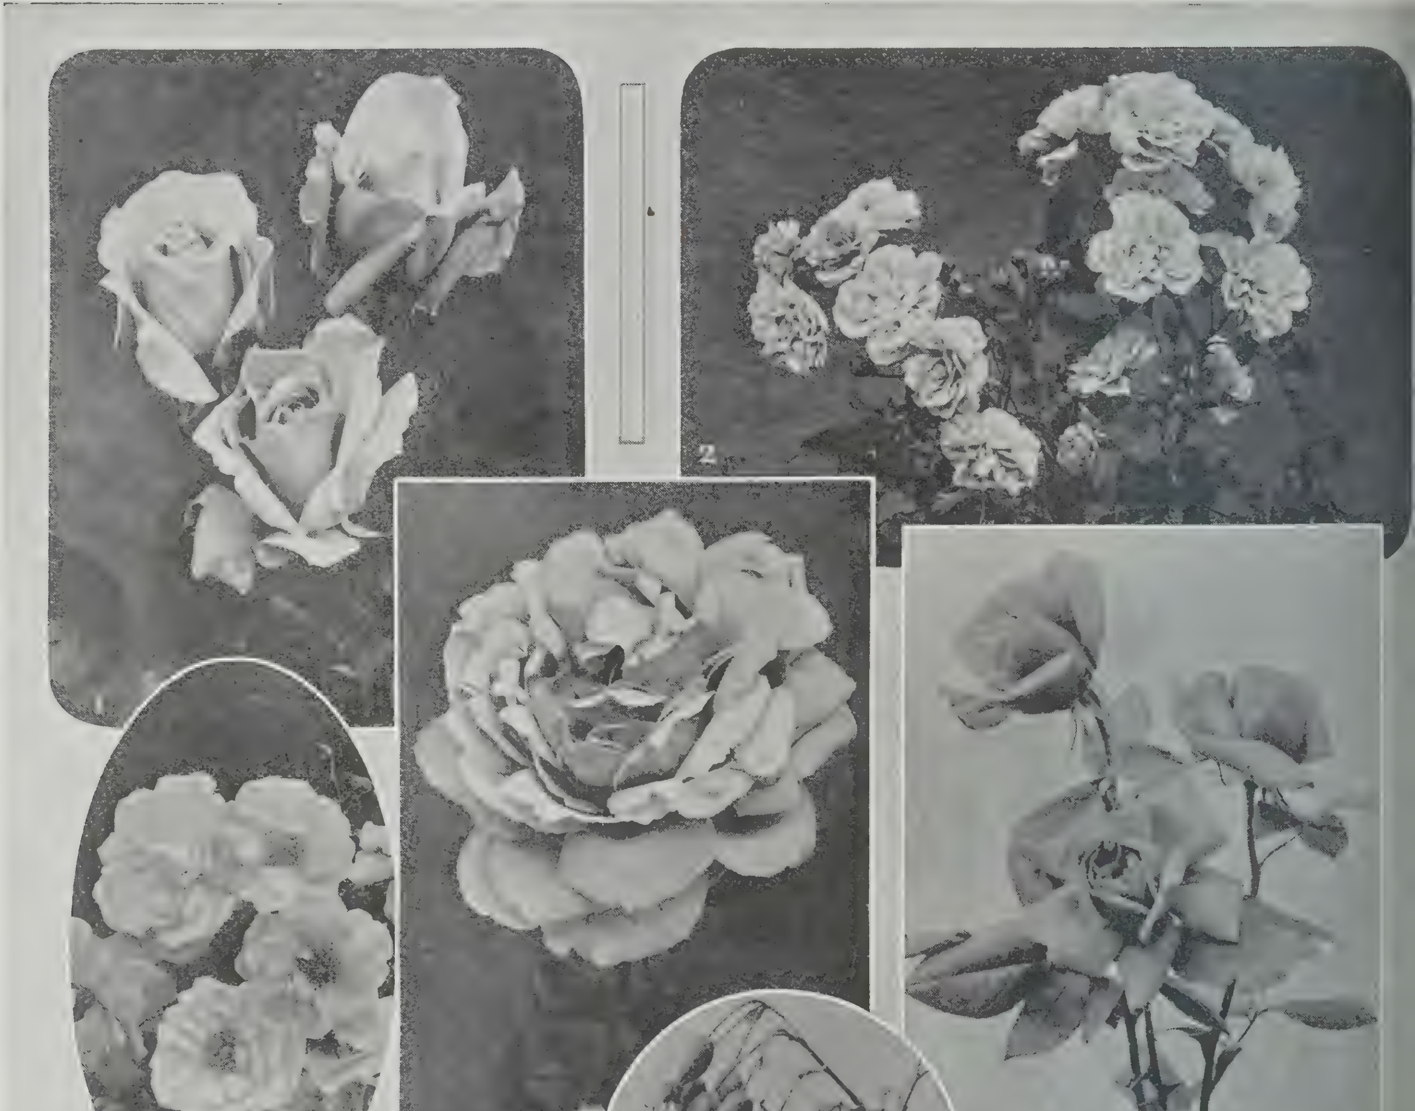
A basket of Mrs. Sam McGredy, a promising new Rose

Flowers scarlet coppery orange, flushed with Lincoln red. The foliage is of dark bronzy green

Mrs. A. R. Barraclough is a fine Rose, especially in our northern districts, and there is similar praise for Dame Edith Helen from my southern friends. These are two notable new pink Roses. Shot Silk still comes under the category of newer varieties, and it is difficult to find fault with this superb Rose. Whenever I find anyone bemoaning the loss of fragrance in the newer Roses I feel as though I would like to hold that person nose downwards in a bunch of Shot Silk. It is one of the sweetest Roses we have, and such handsome foliage, too. What more exquisite colour is there than Shot Silk in its first freshness? Let us hope that there are many more new Roses as good as Shot Silk.

YELLOW ROSES

I like yellow Roses best when the garden is rain-dimmed. They seem to be the lanterns that light up the other colours. Starting with the pale yellows, two of the best are Mrs. Beatty and Richard E. West. Both have some of the Marechal Niel colouring in them. How different these two Roses are in habit. Mrs. Beatty is rather petite, with very shapely blooms of great lasting qualities. Richard is a rampant grower, with strong, branching growths, pointed buds, and quite full enough if it is disbudded a little. In the mustard yellows—perhaps the brightest of all—four of the best are Christine, Mrs. Wemyss Quin, Golden Emblem, and Mabel Morse. Each has some outstanding quality, none is quite the ideal, perhaps. I have seen a new yellow that



A SELECTION OF ROSES

1. Columbia, clear soft rose of beautiful form.
2. Callisto (Hybrid Musk), perpetual flowering bush with golden-yellow clusters.
3. Penelope, another Hybrid Musk; clusters of shell pink shaded salmon.
4. Zephirine Drouhin, a time-honoured favourite of the sweetest fragrance, very free flowering.
5. The Buttercup-yellow Mrs. Beckwith; flowers not large but exquisite form, ideal habit, and mildew-proof.
6. The brilliant red hips of Rosa fasciculata.
7. Dainty Bess, a Rose of singular beauty for table decoration.
8. The Ophelia-like Lady Sylvia, suitable for cultivation und glass.

e in commerce shortly that will prob-
ipply the requirements of an all-round
Rose. Florence Izzard, with its
buttercup-yellow blooms, is different
he foregoing quartet. It has been ex-
ially good during the autumn.

CONCERNING CRIMSONS

e, again, we have no ideal crimson.
Colonel Oswald Fitzgerald is at its
nd where it will grow well, it is diffi-
beat. It is an aristocrat among crim-
So, too, is Portadown, when it is at
st. I like James Gibson very much,
lly towards the end of the season. It
st that little bit of scarlet in it which
the colour so bright. In autumn Lady
Maglona is very good, but in summer
ngs her head most bashfully. The rich,
flowers of Lady Worthington Evans,
gh little more than semi-double, are
attractive, and this is both a good
and very free-flowering. Sir David
is a strong grower, with large, shapely
s. Hadley is very fine in autumn. Miss
van Rossem is a pretty little flower of
orm and rich colouring. Probably the
ecorative crimson variety we have is
veetly scented Etoile de Hollande. It
creased in popularity during the last
ars, and deservedly so.

VHITE, CREAM, AND IVORY SHADES

white Roses can beat Mrs. Herbert
s, which bears the most shapely, spiral
naginable. It is very fine when grown
standard, and I find it splendid on
a. White Ensign is purity itself in the
unny weather, but when the days are
there is just a suspicion of cream in it.
dy's Ivory, a newcomer this autumn,
best I have grown in this colour—long,
l buds and finely built full blooms. It
trong grower with very clean foliage.
e Goodacre is one of the best of the
shades we grow in the north of Eng-
and in this district it is outstanding.
Villmott is a large, shapely flower with
harming colours, cream with just the
t tint of pink near the tips of the petals.
white Rose that I saw in excellent con-
in Essex is Caledonia, which is well
a trial.

ORANGE SHADES

me last of all to these—my favourite
s. Duchess of Atholl is a very beauti-
iety, a rich, deep orange of good shape
stages. Lady Roundway is a well-
Rose of rich, deep colour and plenty of
nce, but it does not grow too well here,
is hardly free enough for garden de-
on. Angele Pernet has much to recom-
it—lovely soft colouring and handsome
foliage, but it is rather too fleeting. It
seem prejudice, but I think that no
in the orange shades is quite as good
namesake. There is no Rose so free
lisease and at the same time so vigor-
d free-flowering as this. It is a good
nal, when the flowers are a little bolder
they are in summer and do not open
so quickly. But the richest colour is
weather with a little sunshine or
h in the air to give that reddish-pink
iat overlays the yellow. When you see
e mass it is even more impressive.
ion Cran, Portadown Bedder, Desmond
on, Lamia, Independence Day, and the
Lady Forteviot are all lovely colour
in which orange or yellow predomin-
In the Polyanthas Orange King and
Salmon are two varieties that provide
ling bit of colour when massed. The
Polyantha Roses are worthy of more
ence in our gardens. A bed of either
of the two kinds mentioned or of Coral Cluster, Eblouissant, Else Poulsen, or the old favourite, Mrs. Cutbush, would provide a welcome display.

NORMAN LAMBERT.

Winter Sweet

Some delicious, fragrant, spicy whiff as one walks through the garden in mid-winter—can you not imagine how welcome it is? And there are so many to be had for the asking!

In the early spring we have the little Daphne Mezereon, the sweet little shrub familiar to most of us; but for true winter sweetness get Sarcococcus humilis into your garden, and, as you pass by, you will get the sweet scent of it borne by the wind for 15 feet or more. It is a rounded, evergreen shrub with little white flowers, ridiculously small for the amount of fragrance they produce. It will flower from about the end of January onwards for several weeks. Sarcococcus Hookeriana digyma is even more attractive, as, in addition to being equally sweet-scented, its leaves are delicately margined with pink and the young shoots are rosy. Both are quite hardy and will do well either in the open or under trees.

Then there is the well-known Chimonanthus fragrans (the Winter Sweet), which deserves a place in any garden that can give it a warm south wall. Cut it in well in the spring after it has finished flowering, as the nearer you can keep it to the warmth of the wall the better it will flower. It will cover a wall with a shimmer of pale yellow from December to March, flowering on the bare wood in hanging bells, the long, pointed outer petals of yellow half hiding the inner petticoat of crimson.

The yellow-and-rust fuzz of that old friend, Hamamelis mollis (Witch Hazel), though not so fragrant, is also worth growing, and it will do perfectly well in the open. It is at its best about February, though it will start flowering a month before that at least. It is a rather spreading, low shrub, bearing its many rather curious flowers all up its bare grey stems.

Viburnum nervosum is another and a very beautiful addition to the sweet-scented flowering shrubs of winter, but it is not yet on the market. From the beginning of January onwards, in all but the very hardest winter weather, it produces fragrant, tubular, pink flowers in clusters, each flower about 1 inch or 1½ inches long, at the tips of short, lateral, spur-like growths. They are about the colour of a Strawberry ice-cream, a very exceptional colour for this time of year. The habit of growth is upright and the wood a shiny brown.

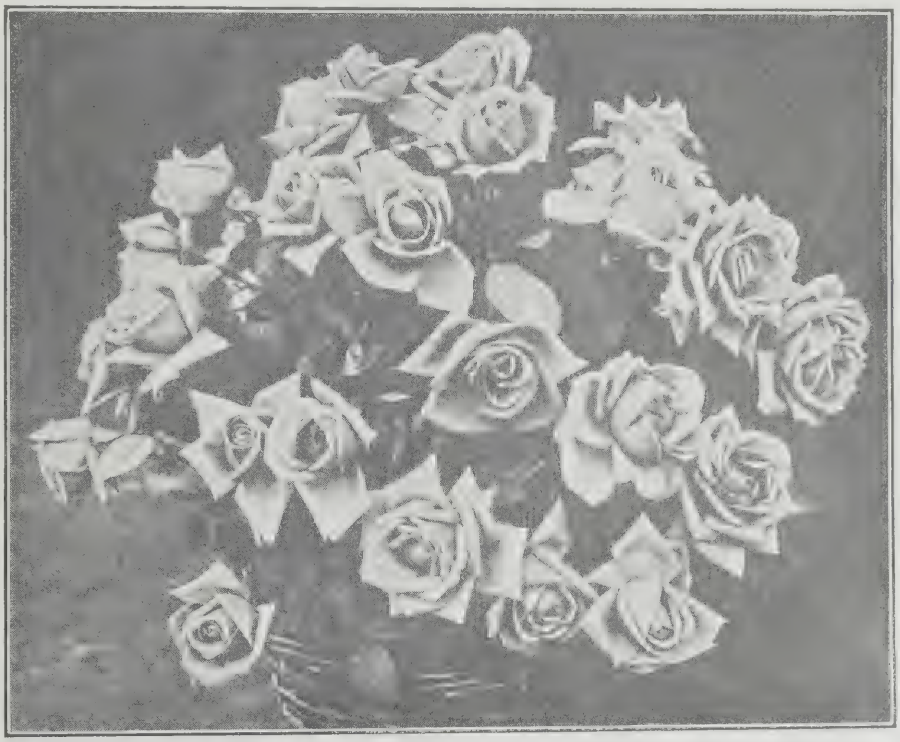
L. STOKES.

Howth, Co. Dublin.

Ourisia coccinea

It is well nigh impossible to prescribe any hard-and-fast treatment for this plant; in some gardens, tried in all manner of soils and situations, it is adamant in its refusal to grow; in other gardens it romps and crawls with rapidity and vigour and gives generously of its beautiful vermilion flowers. Where I know it at its best is in cool, half-shaded places, where its purplish, caterpillar-like stems crawl in all directions and emit a profusion of the fresh, green, crinkled leaves; the loosely-arranged pendant and brilliantly-coloured trumpets are carried some 8 inches or 9 inches above these leaves, and a few plants in flower is indeed a lovely feature. I would suggest for the plant a rich, moist soil and the close proximity of damp rock. Plant Ourisia on the shady side of the latter and there will be reason to hope for success with this brilliant little plant, which came from Chili so long ago as 1862. I once had it running about in the light shade afforded by Azaleas such as rosaflora, etc., and here it was exceedingly attractive. It is of interest to record that Ourisia commemorates Governor Ouris, of the Falkland Islands, from whom Commerson obtained the plant. There are one or two other species in cultivation, but rarely met with.

RALPH E. ARNOLD.



A basket of Shot Silk

One of the sweetest scented Roses we have

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Daphne arbuscula

I WAS interested to see Dr. Jenkin raising the question of the unknown history of this plant in our gardens (issue November 9th, page 752), and hope that someone will put us right on this questionable subject. I have hunted in vain for years to get reliable information about this attractive little plant, for it is evident the plant we love under this name is neither D. arbuscula of Christ, which is a sub-form of the well known Daphne Laureola, nor the narrow-leaved and diminished Austrian form of D. Cneorum, which Farrer seems finally to decide the D. arbuscula of gardens to be.

I intimately know plants of Daphne arbuscula, which are now compact patches a foot across, and cannot see that the rather few, long-tubed flowers, covered with a fine pubescens, and much larger than those of the finest known form of D. Cneorum, or the absolutely distinct, upright habit of growth, and the long, narrow, slightly rolled underleaves show any close relationship with Daphne Cneorum.

Of late years I have considered D. arbuscula, as we know it, to be the D. arbuscula of Celak, who describes his plant as a dwarf evergreen shrub with reddish branchlets, leaves crowded at the ends of the branchlets, and linear oblanceolate in shape, pubescent or glabrous beneath, ¾ inch long, and the flowers as being carried in terminal, three to eight-flowered heads. The flowers are described as pink, which is rather loose—I should rather say a shade of lilac—and Celak gives the flowering time as June, and the native habitat as Hungary. In my humble opinion D. arbuscula stands botanically much nearer to D. rupestris (D. petræa), and without knowing the positions it chooses to grow in in its native habitat should regard this, in common with D. rupestris, as a true Alpine plant.

D. Cneorum, as I know it in the Eastern Alps, I must class as a sub-Alpine plant, belonging to the coniferous zone and never ascending to the levels of D. striata, which, by the by, is probably the rarest of the Alpine Daphnes in cultivation in England. I cannot recollect ever seeing a sound, thriving plant of it in any English garden or nursery. I believe I can claim to have seen the greater number of our European Daphnes in their native places, including this year Daphne oleoides and its varieties glandulosa and puberula on Mount Olympus and Mount Smolika respectively, and have for many years tried to cultivate all the hardy Daphnes obtainable, so may be credited with a certain amount of experience and knowledge of them, and feel assured that Farrer was indeed widely wrong in describing D. arbuscula as only a form of D. Cneorum. I hope that this correspondence may lead to further light being shed for the benefit of inquiring minds like those of Dr. Jenkin and myself.

W. E. Th. Ingwersen.

Aralia spinosa (or chinensis?)

When in full flower in September this is always very attractive, but with me has never fruited until this year. Covered with its foot-long inflorescences spread out fanwise from the apex of the stiff branches, the main inflorescence stem and side stems of a pale purple tint, from which dangle bunches of black-purple berries, the whole thing is attractive and of quite unusual appearance.

Glos. F. W. C.

Large Tomatoes

By this post I am sending two Tomatoes for your acceptance. In a recent note in Gardening Illustrated, signed "East Sussex," I mentioned two fruits of this variety that weighed 2 lbs. the pair. The pair I send now weigh 2 lbs. 2 ozs., the larger one being 1 lb. 2 ozs. and the smaller one just 1 lb.

The origin of this variety may be of interest. Some years ago I purchased seed from a firm in the U.S.A. of a variety which they called "Pepper-Tomato," and which they asserted was the result of a successful cross between a Tomato and a Capsicum. Neither my friends nor I could discern any trace whatever of the Capsicu the resulting fruits, and I was not surpr to read subsequently in an American jou that so far as its supposed pedigree was cerned, the variety "cut no ice." T was, in fact, an extraordinary mixtur forms in the plants I raised, as they diff greatly in colour and shape. I selected saved seed from one because of its enorn size, and for some years I have continue re-select it for size, the result being the f I send. It may, perhaps, be considered big for most purposes, but in growing to a size I find it has lost nothing in good q ties, being firm, fleshy, and well-flavou in fact, a very good Tomato indeed.

Statice profusa superba

Shown in a large group at Vincent Square on Nov. 19th by the Rolvenden Nurseries, Rolvenden, Kent

Stachyurus præcox

Though the books and catalogues do puff this for its autumn tints (or even tion them), with me it is one of the f things in that way in the garden. Ordi frosts which bring down its neighbours Cercidiphyllum japonicum, the leaves of w have already fallen without colouring a this year) do not seem to touch the leaves of Stachyurus. It commenced colour in September, and is now (Nover 11th) a mass of red and pink, with a leaves here and there still retaining the green summer colour (hardly any fallen), the fresh green enhancing mously the splendid red shades.

Hambrook, Glos. F. W.

Statice profusa

AS is well known, many of the Lavenders are valued for their effec the hardy plant border. In additio these, there are a few members of the fa which are equally valued for their useful as pot plants in the greenhouse or cool servatory. These furnish, round about time, a delicate shade of blue—a colour w is never too plentiful under glass, and which acts as a foil for brighter hues. latter are most probably hybrids, and among them is S. profusa. It is not a diffi plant to manage, yet occasionally it may seen in a condition which is far from s factory. S. profusa must not have an ex of moisture, nor must it be grown in a atmosphere, while, in addition, ample dr age is required. I have had much suc with the plant by growing it under condit which are, to all intents and purposes, q cool and in a compost consisting of loam leaf-mould in equal proportions with, course, a good admixture of sharp sa S. profusa, in my experience, is sterile, must be propagated by means of cutti These are much more difficult to root t those of the majority of greenhouse pla and, when it can be done, they should given the advantage of a close propagat pit, in which there is a certain amount bottom heat. The stem ought not to be bu below the base of the leaves, and to errors this respect may be traced the failures w not infrequently happen in the propagatio S. profusa. A Scottish Gardener

Lilium canadense and its geographi distribution

I can bear out Mr. J. Henry Watson's on the Lilium canadense and also the Op tias (issue November 16th, page 768). various districts of the Prairie Provinces, only on a level with Medicine Hat, etc., th are three or four varieties of Cacti w survive a most cruel winter climate. I h got these Cacti doing quite well at Tho (Essex), and the yellow Opuntia flowered q freely last winter. In winter I give th the protection of sheets of glass to save th

the damp, and they seem quite happy.
m canadense is oddly varied, in that
blooms have spots, others are quite
in, clear yellow. I saw them best, I
, near Trail, B.C., where they were
ing thickly on the railway embankment,
ulbs a long way under ground and hard
t at. They really are to be found pretty
all over Canada, L. Philadelphicum
in the West, and then only in certain
ties, but in those it is most prolific.

onomising space in small gardens

IKE many owners of small gardens,
ant to grow everything, and find great
fficulty in doing so. Colchicum specio-
is a great sinner by reason of its coarse
s, but have it I must, and I find that
planted amongst Lilies of the Valley it
well, the blooms showing very effectively
st the changing colours of the Lily
s. We cut away the foliage of the Col-
m as soon as possible and long before
ilies flower. I may mention that my
of the Valley are of a late-flowering
ty and came to me from a fine old Devon
ner under the name of "Hawkins, late
h," but though much admired nobody
s to know of it. The big plant in the
round (left) is Geranium anemone-
n, which I, in my ignorance, planted in
too good soil, with the result that there
een very little flower. The foliage is
ificent, but to bloom well I am told it
starvation diet. With the eye of faith
nay see a little clump of Belladonnas in
ed under the greenhouse, but they have
a disappointment this year, perhaps ow-
the dry spring; goodness knows it is not
to the lack of a good baking.

Quality in Pears

e subject of quality in Pears is of peren-
interest, and as one who has, to some
t, specialised in the Pear, I may, per-
be permitted to amplify the note over
ell-known initials "E. B.," and which
red in the issue of November 9th. As
riter correctly states, perfumed or, as
lls them, aromatic Pears are not appre-
by all, and, I confess, they do not
ially appeal to me. That is not to say,
ver, that such Pears are by any means
or in quality. Quite the reverse; for
nn Bergamot is, admittedly, in the top
. Its flavour is very rich indeed, and its
, rather "dumpy" fruits are very melt-
although at times rather gritty at the
I imagine there are two forms of this
—one a very old variety which has been
n as Autumn Bergamot for centuries,
he other the Bergamot d'Automne of
mel, which is quite a different Pear.
B." also mentions Sickle, by which I
rstand Seckle—a Pear with a rich,
-like flavour. It has a russety skin,
bronze on the sunny side, and turns a
ellow when ripe. The variety makes a
iful dish in the dessert, and when in
n (in the end of October with me) it is
antly in request, although the fruits are
. The tree bears best upon the tips of
receding year's wood, the fruits usually
in clusters of three. Seckle is a heavy
er. I believe it is of American origin.
not quite clear as to the variety which
B." mentions under the name of Van
le Clerc—probably, however, it is
le Clerc (Van Mons), so called to dis-
ish it from Leon le Clerc de Laval. The
r is usually simply called Van Mons—
am not in error—and it is one of the
Pears raised by the great Fleming, who
us Marie Louise and many other famous

Many interesting plants find a home in the garden of Mr. C. Prentis, Posiers, near Sittingbourne

Pears. Leon le Clerc, in my estimation, is only moderately good—it halts between two opinions and is neither melting nor hard. I am on secure ground when I mention Forelle, and I am glad to find that "E. B." appreciates this fine but little known Pear. As he no doubt knows, the variety is known as the Trout Pear owing to the fact that as the fruits ripen the skin assumes a deep red colour spotted with grey specks, resembling to some extent the skin of the burn trout. Forelle is a very handsome Pear, the fruits of medium size, and with white flesh. In some seasons it is half melting, in others quite so. Its season varies. I have had it in November, but at times also as late as January. One of my lads who was in the Army of Occupation in Germany after the close of the war told me that under the name of Forellenbirne he saw large numbers of this variety in that country. Among perfumed or aromatic Pears I may mention Fondanté d'Automne, a delicious Pear of good size, and which does well on the Quince; Easter Bergamot, a good but little known variety; Passe Crassane, perhaps the most highly perfumed of all Pears; Delices d'Hardenpont, a Flemish variety of some merit, although the flesh is in some seasons inclined to be gritty; Gansel's Bergamot, almost certainly of English origin, and most probably a seedling from Autumn Bergamot (the old variety); and Doyenné Boussoch, a very useful Pear indeed. All these, as well as many others, I have, at one time or another, grown with a considerable amount of success, and I hope these necessarily brief notes may be of service to those who admire the Queen of Fruits.

A SCOTTISH GARDENER.

Prunus nana Firehill

My efforts to find a stock on which to graft this lovely little shrub, and so bring it within reach of every garden, have not met with success. However, by layering some of the shoots last year I have succeeded in getting a few plants in addition to one or two from suckers, and have been able to supply readers who asked me to let them know where it could possibly be obtained. It suckers very freely in a suitable soil (not my black, reclaimed bog), and if cut down immediately after flowering. The curious thing is that it flowers on the suckers the next spring, the little scarlet buds running up each straight, wand-like stem—a veritable Aaron's rod, as Mr. Bowles wrote me! Cuttings have failed to strike, but this year I have gathered some of the fruit and shall sow it in spring. The fruit was like a very small and rounded Almond and was on the old bushes only.

ALICE MARTINEAU.
(Mrs. Philip Martineau.)

Flavour in Tomatoes

Some time ago I saw an inquiry in your columns for a really well-flavoured Tomato. Those who have eaten Tomatoes in America, in Roumania, or other sunny lands, yearn for the rich red, almost purple-red, flesh of this delicious fruit, which is very unlike the subacid and watery scarlet Tomatoes we grow here. The nearest approach to the ideal fruit in mind is Kondine Red, though some well-flavoured Tomatoes called Sutton's Outdoor, grown on a sunny slope in a Surrey garden were tasted by me this hot, dry autumn. Kondine Red being grown under glass.

ALICE MARTINEAU.
(Mrs. Philip Martineau.)

Pink Asters in an Aster border

Mr. Arnott's reference to Miss Jekyll's advice on the planting of an Aster border sets me wondering. For there is no one who has taught us what most of us know about colour grouping in the garden as has Miss Jekyll, and for that teaching we are for ever in her debt. And yet it seems to me there is a place for pink Asters in an Aster border, not necessarily with mauve and white, but with mauve. I have had so much pleasure this autumn from a jar filled with mauve and pink Asters, all shades, light and dark, that I am planting a long border which at one end widens into a bed, beginning with a few white and pale mauve varieties, the colour deepening till, through mauve and pink, dark purple ones run into a widely planted group of Azaleas, Berberis Thunbergi, Prunus Pissardii, and a Circidiphyllum japonicum. I find those pinkish varieties very pleasant when grouped near purple-leaved shrubs. The combination certainly lacks the clean beauty of mauve and white; it is, I think, more appropriate (because less startling) where the background consists of Douglas Firs and Beeches, whose colour reminds one of Irish Red Setters. A certain weight of colour seems to be needed, that is why I think it is better to replace the white with pink as the colour deepens.

GREY LADY.

Fifty Years Ago

Orchards on Grass

HUNDREDS of acres of Apple orchards may be seen near Maidstone, some on grass and some with bush fruits between the trees, Gooseberries, Currants, and Nuts being the general undercrop. During this season, however, many fine plantations have been cleared of bushes, and the land is being sown with grass seeds to be fed off with sheep. This is not because the bush fruits failed, but because the Apple crop is so much more valuable that it is thought the trees should be freed from such root robbers. Thus set at liberty the surface-roots can revel undisturbed in the grassy sward, and be constantly enriched by top-dressings. Under this treatment finer and cleaner samples of Apples are produced, and more money is realised without the bush fruits than with them. Of course, during the first few years, while the standard trees occupy but little space, the under fruit succeeds well and helps to pay expenses until the trees come into bearing; but the majority of cultivators of established orchards are daily becoming more in favour of a grass crop over the roots of Apple trees; and, in addition to feeding sheep and other small stock under them, very few crops now repay a good rich manuring better than an Apple orchard.—J.G.—*November 22nd*, 1879.

Berberis yunnanensis

This very stately and beautiful plant stands out quite conspicuously among its fellows. It is of taller and looser habit than the majority of "Chinese Barberries," and bears a profusion of coral-red fruit. Its habit is very graceful, the shoots forming the most elegant arches, beautiful both in form and colour. The most distinctive feature is the deep red colour of the young shoots during the first year. This is lost in the two-year-old stems, which change to a dark brown. The shrub is distinct by reason of its height, as well as the colour of its berries, and will probably prove to be one of the most valuable of the group. Tall, spreading, gracefully plumed with foliage which for richness and beauty of colour is almost without a rival, it cannot fail to make a striking feature in the open garden.

As some of the newer forms of Chinese Barberries are inclined to grow dense and sucker freely I think the more compact character of the above will prove useful to those who prefer those kinds possessing a more elegant and pleasing form of growth.

A warm, dry, sunny place will put some good autumn colour into the foliage, and, given a very average soil to grow in, will cover themselves with pendent clusters of lovely coloured berries every year. It is quite distinct in appearance from any other cultivated Berberis and is worthy of general employment in the ornamental shrubbery, the young shoots giving fine colour in winter.

H. STEVENS.

November flowers at Kew

ALTHOUGH November cannot be called a flowery month, a visit to Kew at the present time will convince many that the garden need not be without some interest, and that the conservatory can be almost as gay as in spring. Chrysanthemums, Crocus, Cyclamen, and Nerines still linger, and there is a really fine border of Zephyranthes candida outside T block. (How seldom this is seen in private gardens!) The autumn tints and wonderful crops of berries on Cratægus and Pyracantha looked very beautiful in the sunshine. Gentiana sino-ornata, in the rock garden, is another invaluable plant still with plenty of bloom.

In the conservatory Tibouchina semidecandra, a splendid greenhouse subject with rich, royal purple flowers, is very striking. Abutilons in great variety, the yellow Cassia corymbosa, some fine Cannas, Impatiens Oliveri, Clerodendron fragrans, and on the roof Lonicera sempervirens, Plumbago capensis, and hanging baskets of Begonia Haageana, and a fine double red and white Fuchsia var. Mrs. Allard. Then there is Streptosolen Jamesoni, Celosia plumosus, scarlet Salvias, and Callistemon citrinus, now nicely out. Primula obconica and some fine, bold groups of Chrysanthemums contribute to a very successful whole.

An edging of Zephyranthes candida at Kew

In the Orchid houses are to be seen s good Cypripediums, Pitcher plants, Sarracenias, always interesting and perh now at their best. In the annexe there most interesting collection of Gourds (their country of origin), including the from which "Loofa" sponges are obtai

In the temperate house large pots Chrysanthemums — Cullingfordii (crim with a gold reverse), Portia (deep oran and Goodfellow (yellow)—looked fine u their canopy of Tree Ferns and Pa Rhopalostylis (the Norfolk Island Palm now in fruit. In No. 10 Victoria Regi still flowering, so there is still quite eno of interest to make a sunny November at Kew an enjoyable one.

Herts. ATHELSTAN WARNE

The August borders

YEAR by year the bit of double flo border we call the August border, which includes September, becomes greater interest, as one sees ways in whic may be made better. It is where we h flowers of pink, purple, and white colo ings, with a setting of grey foliage. H and there at the back are bushes Ceanothus and Sea Buckthorn. Clem Jackmanni is trained into these and tum out in masses of splendid purple that m the grey of the Artemisia below. Pink white Dahlias are beyond, and in front p Phlox, white Gladiolus, and pale laven China Asters. On the other side, backed the silvery-grey weather boarding of building, there are pink and white Ho hocks, the tender pink of Lavatera olbia, again China Asters of lavender and d purple colouring, with a full setting of silvery Artemisia. The top picture sho the double border nearly its full length, w groups of the fine purple Dahlia Porth lavender and pink Phloxes, and the sa setting of grey foliage. It is the best th in the garden through August and Sept ber; quite a pretty picture of good col harmonies, but always fruitful of indicati for some bettering for the next year.

G. J

Discarding old Chrysanthemu stools

It is a mistake to discard old stools Chrysanthemums before sufficient cuttin have rooted, for sometimes it is found th certain cuttings fail, and unless there are t stools to fall back upon, there is a likeliho of a shortage of the very sorts wanted. The fore, look after the stools a little longer refreshing them with fresh soil about the su face, if need be, to encourage growth suckers. More than this, one may, with vantage, keep a few of the stools of t earlier and mid-season sorts, placing them a cold frame until it is safe to plant them of doors. Such old plants will come in use in the garden for supplying quantities flowers for cutting. Last season I follow this plan in the case of Jean Pattison, M R. Hamilton, and a few others that ga many flowers in October in the open groun Whilst many sorts throw up suckers readil others are not so free, and it is these should look after. Let it not be forgotten th for home decoration one may strike cuttin as late as March. W. F.

Rose planting

Keep abreast of this and other simil planting before the soil has become t saturated, but avoid planting of any ki when the latter is sticky and does not lea the tools freely.

Alpine Gardening in New Brunswick

ALTHOUGH Alpine gardening has been popular for some time in Ontario and British Columbia, here, in New Brunswick, it dates back only six years, when Mrs. Myres, of Fairvale, near St. John, built the first rock garden. I have been an amateur gardener for 30 years, but it was not until last summer that I realised what I had been missing. Being delighted with the idea of such an interesting variation of this most desirable of hobbies, I decided to construct a low rock wall, against which I made a rock bank. The wall was 2 feet high and 15 feet long, with a bank of fibrous sandy loam 15 feet wide.

The bank was terraced with weathered rock of rectangular shape, and planted with Aubrietia, Sedums, Thymus, and Sempervivums, while the face of the wall was planted with Saxifraga longifolia, Androsace sarmentosa, and Sempervivums. I was surprised at the growth they made last Fall—October—when they were planted, while now, in spite of 31 degs. below zero and very little snow, they have grown so rapidly as to be running over each other already. The Aubrietias and Phlox, amœna and subulata, were a mass of bloom this spring.

Besides the rock bank and wall, I also built a circular bed, with a pass in the lower side leading to a fan-shaped moraine.

The circular bed had odd-shaped rocks sloped back into the sides, the centre being almost level, and planted with Edelweiss. The little pass—or gorge—made with larger rock, was planted with woolly mountain Thyme (Thymus lanuginosus), and amongst this the green Thyme (T. montanus) made a very interesting pattern.

The moraine, below this, descended a gentle slope on the south-west side of my house. Alongside the moraine large rocks were placed to give the effect of being washed down from above by a freshet, while stone chips along the bottom of this valley helped to enhance the effect.

Helianthemum, Potentillas, Cotoneasters, and Cytisus were planted against these rocks, while the bottom was planted with Veronica repens, Arenaria cæspitosa, and Sedum acre, with a clump of Iris cristata here and there.

Until recent years we used to have at least 2 feet of snow each winter, and the drifts—knee-deep—were known to lay as late as the end of April. Last winter—the mildest for many years—we had practically no snow, rain in December and January, and a low temperature of 31 degs., as against 50 degs. below zero other years.

Despite the loss of our warm blanket of snow, everything but Erysimum and Tunica lived and have developed really wonderfully. This was very encouraging, especially as I had used only sandy loam and rotted leaves for compost.

For rock, being far away from my native Westmorland (England), and, therefore, unable to obtain limestone, I searched the lanes and pastures and found many beautifully weathered specimens of what appears to me to be sandstone. This black rock is really all shades of green, bronze, and purple, and crinkled and fluted in such a way as to make ideal material for an Alpine garden. The little bays and hollows in this rock make ideal homes for diminutive Alpines, and the wonderful shades of bronze, green, and purple make a perfect background—moreover, the edges are usually rounder, though the blocks are rectangular.

Later, having discovered the splendid works of the late Reginald Farrer, I built a rock border for more difficult Alpines. This was excavated 3 feet deep, and, with the retaining wall of 1 foot, the plants have a root run of 4 feet.

I have not regretted this labour, performed by myself, for during a very wet spring I had no trouble from damping, due to the 2 feet of rough drainage and the amount of rock chips and gravel used in the upper 2 feet.

Although this border was only built this spring I have had some bloom all through the very dry summer, when we hardly had a good shower for over two months.

The Campanulas, muralis and garganica, have bloomed steadily, and, like the Androsace lanuginosa—which, from a dozen plants, has formed a silvery mat of 1 yard in width—appear to have decided to go on blooming till frozen up.

This summer Acantholimon—raised from seed sown indoors on January 29th—has bloomed for over six weeks.

The Geraniums and Erodiums—especially macradenium, my favourite—have bloomed all summer, and are still going strong. Gentiana sino-ornata and Asters are starting now, and Anemone japonica is preparing to follow suit.

The foliage of the Erodiums Chrysanthemum and macradenium is beautiful enough without flowers, while the dainty little faces of E. macradenium, with that "ingenious and fascinating expression of innocent worldliness" so aptly described by Farrer, are a constant delight.

Sedum pilosum, with its tiny pink cups—40 of which I counted on one stem—and
House-Leek-like appearance, was my fa
ite until Erodium macradenium bega
bloom.

Saxifraga media is a delightful silver
frage, and, like the hearty Saxi
Cochlearis, makes lovely colonies,
nately with Mossies and groups of that
little plant Dianthus arvernensis.

I have a programme for next ye
grow from seed obtained from the Fl
Nurseries of M. Correvon many intere
plants not obtainable even on Vanc
Island, where the best and most intere
plants were supplied by the Rock
Gardens. Whether I am too ambitiou
future will disclose, but as I have 14 see
Saxifraga longifolia from a packet of
purchased at Floraire, I have hopes of
further success.

Some of these, I think, will not be diff
such as Synthiris reniformis, which is sa
withstand zero weather, a useful accom
ment for any plant which proposes to
our winters. Isopyrum thalictroides
Selene Hookeri may not do so well, but
is no harm trying, and one never knows
delightful surprise may be lying dorma
a packet of seed.

In my large Alpine border there are
plants, which are a constant sourc
pleasure. To the left of this I have a sm
one, bordering on the back drive, whe
joins the lane, and in this I plant only
Alpines which appeal to me the most. T
borders, six in all, complete my rock ga

Here where we have Indian sum
(November) plants continue to grow late
the Fall to make up, I presume, for the
in the spring. So I am looking forwa
two more months, at least, of beauty i
New Brunswick rock garden.

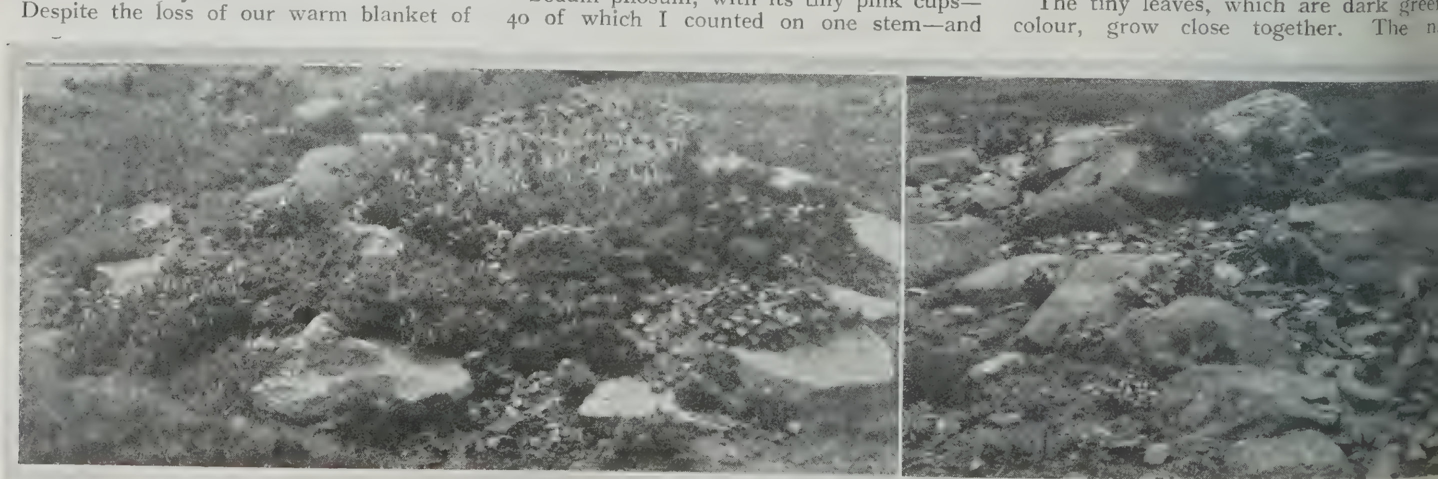
white, scaly bracts.

The tiny leaves, which are dark gree
colour, grow close together. The n



ALPINE GARDENING IN NEW BRUNSWICK

Circular moraine containing Creeping Phlox and Androsaces, with Edelweiss in the centre

A corner of a special Alpine bed, where favourites only are planted ychia is derived from a Greek word ng a remedy for inflammation of the The peasants, and more particularly ıepherds, of the Pyrenees, who are in the healing virtues of their local use these plants to cure skin inflammaoth on themselves and their animals.

VICTORIA SLADE.

rosace argentea (syn. imbricata)

IS rare plant grows on dry rocks at ı altitude of 8,000 feet in the Western lps, and is to be regarded as an ariston its genus. Although so characterly Alpine, it is by no means a difficult to grow at home.

plants illustrated are almost life-size, ere grown from seed which ripens and nates freely. It is probably easier to than any of the other high Androsaces, is also the most intolerant of excessive ıre, both overhead and at its roots.

dhead. N. W. JENKIN.

'he proposed Rock Garden Society

he inaugural meeting on October 23rd visional committee was appointed to up a scheme for the formation of a Garden Society. All the members, he exception of Mr. D. G. Renton, who ınable to come, but was good enough oress his views on paper, were present. ollowing proposals were unanimously ed to be put before the General Meeting held at the New Hall of the Royal cultural Society on December 10th at ., when it is hoped that many will be o attend:—

ROCK GARDEN SOCIETY.—The Society consist of a President, a Chairman, a ary, a Treasurer, an Editor, and a al Committee consisting of not less 12 members of the Society, with correng members from countries outside the ı Isles.

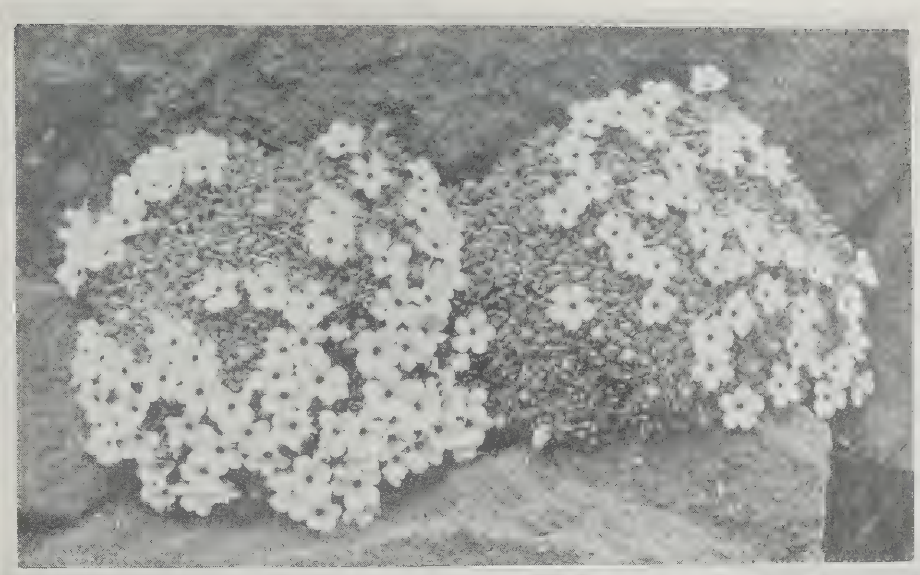
object of the Society is the encourageof the cultivation of Alpine plants.

Society will hold a show or shows d to these plants, and will organise s of entries at general shows. They sue Bulletins in which the problems of ltivation of Alpines will be dealt with perts, who will advise on the construcf rock gardens, their planting, and their o. The Society will give information mbers desirous of going abroad to see in their native habitats. An annual will be held in connection with the al Meeting or show, and the subscripas been fixed at 10s. 6d. per annum.

s suggested that the following ladies ntlemen should be invited to serve on ommittee:—Sir W. Lawrence, Mr. Yeld, Mr. George Baker, Dr. ppi, Mr. D. G. Renton, Mr. Amos Captain Symons-Jeune, Mr. W. E. rsen, Mr. H. Cowley, Miss Victoria Mr. F. H. Fisher, and Mr. Clarence

proposal which met with general al was that prizes at shows should not ıey prizes, but should consist in orders ksellers with a view to the purchase dening books and books on travel, would be suitably stamped with the ın of the award.

hoped that all interested in the formaf the Rock Garden Society will make ɔrt to attend the General Meeting on ıber 10th, when a secretary will be ted and further suggestions for the ution of the Society will be welcome.



Androsace argentea (syn. A. imbricata)

Variations in Perpetual Carnations

Amateurs have had an interesting experience this season with regard to their plants. When they have been treated liberally in the matter of water and manure or top-dressing fertiliser growth of Carnations has been abnormally quick, so that where stopping was carried out early in July with a view to securing plants in bloom just before Christmas quite a lot of plants are now throwing up flower-spikes and blooming. Since a bird in the hand is better than two in the bush there will be few who will not appreciate the early delivery of good flowers. It may be that while we have the flowers now, at Christmas our plants will still be "delivering the goods" if our stopping methods have been judicious. Judicious stopping means the breaking-out of shoots at intervals and as required, instead of doing this work all at one time. The skilful grower, relying perhaps on his judgment and experience, stopped his latest shoots as late as the end of July, and in a season like the present it is just these late stoppings which will give the Christmas flowers.

There is an additional advantage from the early autumn bloom, for, when cut, the shoot commences to make up again for the next crop, which in some varieties occurs in the early year about five months after the previous flower was cut, excepting, of course, in the case of such slow growers as Laddie.

I have sometimes wondered which are the most satisfactory of the amateur's pleasures in growing Carnations. The first experiences are intensely interesting, and each succeeding year has its increased pleasures as former experiences produce more confidence. The grower of confidence then becomes more discriminating, and he notices that some varieties grow more quickly and produce more flowers than others. A large flower of solid proportions takes more out of a plant, and therefore is of slower growth than a variety which produces a smaller flower.

Quantity of cut flowers is more important to the market grower than to the amateur. Amateur growers are rather inclined to regard the split calyx as of greater importance than it is. The wire calyx ring is so easily adjusted, and Nature probably allows calyces to split in order that flowers may open more readily. For the benefit of those who insist that the non-splitting calyx is essential I will mention a few of the varieties which one sees rarely, if ever, split, together with their characteristic faults:—Saffron and Sunstar, the best yellow and yellow ground, slow to open in winter; Janet, the rose-cerise, while free-blooming, is inclined to lose its colour after mid-winter; Ruby Glow, almost perfect in form, shape, and calyx, but is not large, and is inclined to be port wine colour in summer; Countess of Daresbury, the bright rose-cerise which I have never seen split its calyx, but is such a dwarf, bushy grower that it is not suitable for the market grower who likes to plant out closely in beds for cut flower; Topsy, the popular crimson, seldom splits, yet has not sufficient scent; Mrs. A. J. Cobb, the very variety which had the Gold Cup for scent, is very unlikely to break its calyx, but is not a large flower, and rather a tall grower for the amateur; and Melchet Beauty, another of which I remember seeing no instance of a split calyx, has flowers on the small size at times, but otherwise is nearly ideal for the amateur.

LAURENCE J. COOK.

Lonicera nitida

For many years I had to depend upon Privet as a hedge plant. I have no complaint to make against the species for this purpose, but it has been planted to such an extent that the element of monotony has crept in. For that reason I welcomed the development of Lonicera nitida as a hedge plant. It is an evergreen, having small leaves and closely set branches. These qualities make it admirably adapted for the formation of a screen. Although it does not grow quite so rapidly as Privet, there is the advantage that the branches are more closely set, and such drastic cutting back is not necessary in order to get a good bottom. Indeed, I hold the belief—and in this I am supported by one of our leading nurserymen—that it is a mistake to prune Lonicera nitida too severely. The process causes that dying back in parts which has inflicted a certain amount of criticism on the species. All that it is necessary to do by way of pruning is to shorten the branches to the level which gives the desired degree of shapeliness to the hedge (and this may be done at any time during autumn or March) just before growth commences. I find that the roots appreciate a fairly rich, well-worked soil. It is advisable to dig thoroughly to the depth of 1 foot over a width of 18 inches and add partially decomposed farmyard manure at the rate of 1 cwt. per 15 lineal yards of trench. November is an excellent month for planting.

GEO. H. COPLEY.

REMINDERS FOR THE WEEK

Southern and Midland

Fruit houses

The pruning and cleansing of both Vines and Peaches will be more or less continuous from this date, as the second earlies will be ready, and such work occupying considerable time it is advisable to get it well advanced before Christmas. Following the dressing of the various occupants, all glass and woodwork must be washed and scrubbed down with warm soapy water containing the addition of a little insecticide. Paraffin soap is very good, but as water in which it is used will not lather, many prefer a general insecticide.

Plant houses

Bring forward the cleansing of these, as light at this time of year is most important, and should not be excluded by green films upon the glass. Before rearranging the plants see that their pots are cleaned—and, above all, the plants themselves—by sponging.

Vuylstekeana Etna Stamperland Variety (Miltonia Harwoodii x Odontioda Charlesworthii)

Colour a glowing shade of deep velvet crimson with a touch of gold on the lip. Shown at a recent R.H.S. meeting by Mr. R. Patterson, Ardingly. First Class Certificate

Mignonette, Schizanthus, Clarkias, and other annuals

These raised for the purpose of blooming in pots should now receive their final potting, using a rather coarser mixture than before. Free drainage and fairly firm potting is desirable, following which the plants should be grown on shelves or stages where they are kept well up to the glass.

Crotons, Dracænas, Pandanus

These and many other stove evergreens will strike very well if inserted in small pots of sharp, sandy soil, and plunged in pits containing brisk bottom heat at the present time, and are a great advance on cuttings inserted at the turn of the year. This method also makes use of the propagating pits when they are not required for other things, whereas it is often difficult to find accommodation for all we wish to propagate after the turn of the year. Cocoanut-fibre is the best material for plunging purposes inside.

Chrysanthemums

Cuttings will not as yet be numerous, but those which are ready should be taken and inserted in small pots of sandy soil when about 3 inches in length. A bell-glass or small case placed inside a cool house or pit will answer admirably. Air must be given for a short time each day and all condensation wiped from the inside glass, otherwise damping will prove troublesome. Where a number of plants are stood together for the production of cuttings it is advisable to fumigate them occasionally to get rid of Green Fly.

Imantophyllums

Grown in cool greenhouses and conservatories these plants well repay a little feeding applied from this date onwards, showing their appreciation in the dark green luxuriance of their leaves and later by their numerous flower-spikes. Although not grown for the purpose as much as it deserves, the Imantophyllum makes a splendid room plant for those not possessing a greenhouse.

Gladiolus Colvillei

Always desirable are the early, soft-coloured flowers of this plant, to produce which a plantation should be made on a well-drained and sunny, sheltered border. The corms should be planted about 5 inches deep and protected from severe frosts by a mulch of leaves or other litter. The same applies to Ixias and Turban Ranunculi, which are easily obtained and furnish quantities of charming flowers in due course.

Sweet Peas

Sweet Peas sown in September in the open are strong, but as a protection against slugs must be dusted over with soot from time to time.

Delphiniums, Gypsophilas, and Linums

These are often seriously damaged, or lost altogether, during the winter months on heavy soils from the attacks of slugs, which eat out the fleshy portions of the shoots beneath the soil and bark the roots and stems of Flaxes. To prevent this, place a small heap of coal or coke ashes over each crown until growth is free in spring.

Pruning fruit trees

This is now a daily occupation, and must be proceeded with on every possible occasion. Apples and Pears are the first to be dealt with, and it is advisable to get the most exposed trees pruned first, leaving those on sheltered walls for colder days. In pruning trained Apples and Pears it is a mistake to leave too many fruiting spurs and buds, as this results in overcrowding and weak, small fruits.

The Belladonna Lily

This beautiful Lily has surpassed i
this year in all its forms, flowers having
large, abundant, and borne on tall, s
stems. The present is an excellent tim
lift and divide the clusters of bulbs an
make fresh plantations. A warm, su
border is desirable, and the soil, though g
should be well drained. To plant su
fine Lily in poor, hungry soil under the
pression that such is necessary to mak
bloom is a mistaken policy.

The kitchen garden

Digging, manuring, and trenching
be pushed on in order that the n
upturned soil may benefit from the pu
ising effects of frosts. Clear away all s
crops, as these create unpleasant s
when left decaying on the ground. S
Bean and other stakes in a dry place for
year's service. E. MARKHA

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The vineries

In early houses it will now be possibl
prune the Vines and get the cleaning ca
out during bad weather. If the Vines are
of vermin this annual cleaning is a comp
tively easy matter, but if mealy bug be
sent a great deal of both time and labour
necessary to keep this most tenacious
from getting the upper hand. After prun
gather up and burn at once all prunings
other loose débris. The rods should then
gone over and every loose piece of bark
moved. Again sweep up and burn every s
that falls from the rods. All glass, w
work, and ironwork must then be scru
with soap and water and all brick
painted with fresh limewash.

Treating the Vines

The rods are next painted with an appr
insecticide, the old Gishurst Compound b
as good as any other for this purpose. A
applying one coat of this material, a g
plan is to fill all holes or cracks in the V
with the pure Gishurst and then apply ano
coat of the liquid. Before starting the V
a third coat will do no harm. To those
may be fortunate enough not to be trou
with this pest, all this work and care
seem superfluous, but anyone who has
had to do with a vinery infested with
will admit that nothing but radical meas
will ever keep the pest under.

The Peach houses

Any time after the leaves fall the neces
pruning can be carried out. If the sum
treatment was correct, this will not be a
difficult job, the chief thing to do being
remove worn-out wood and an odd shoot or
where there is likely to be a little crowdi
Even clean trees will be all the better dres
with some good insecticide, while those t
may have had an attack of spider, thrip,
scale must be thoroughly treated so as
clear them of such vermin and their eg
As with the vineries, a thorough wash do
is desirable, indeed, imperative, as is the li
washing of walls.

Strawberries for forcing

It is now advisable to plunge the pots to
rims in coal ashes in a cold frame to prev
frost bursting them. The frames must not
closed, as the plants force much better if k
as cool as possible, and are none the wo
although well frozen, providing the s
round the roots is reasonably dry. For t

n the tilting of the sashes at the back best method of airing, preventing rain ating the soil, while still admitting a irculation of air.

Chrysanthemums

ese are much earlier than usual this n, many of them being already past, and o be feared that the supply for Christ- and later will be very short. As the s go out of flower cut back the stems out 6 inches from the soil and set the n a light, airy place so as to encourage roduction of firm, sturdy suckers to be for cuttings.

ng cuttings

om now onwards all suitable shoots can moved when 3 inches to 4 inches long nserted round the edges of 3-inch pots with sweet, sandy compost. After the gs are planted, set the pots on a coal- ed in a cool house or pit and give a good ring to settle the soil. While the cut- require a somewhat longer period in n to form roots in such a position, they m, if ever, damp off, as they are so apt to hen a close propagating case is used.

s in pots

ese may now be brought under glass pruned, providing the house in which are set is kept perfectly cool and abun- e of air admitted day and night. If ted earlier in autumn the plants should a top-dressing of rich, sweet compost. e the roots must not be subjected to dry- too frequent watering must be avoided.

s in pots

e earliest batch may now be removed the "plunge" if they have filled the tacles with roots. Set in a cold frame week or two and then move to a heated nhouse, but do not employ much fire heat st.

nsplanting Lily of the Valley

here it is necessary to do this, or to form beds, now is a suitable time for doing providing frost is absent and the soil in working order. The position should be well shaded and the soil of good quality. ot in very good heart, a fair dressing of rotted manure should be dug in before ing takes place.

de Turnips

ese are very hardy, but it is just as well to have them lifted and stored. The best ion for them is against the north side of ll, where they should be built up steeply hatched over with clean straw and a few turves to keep the straw from being dis- d by the wind. Treated thus, they keep and are easily got at when required.

barb for Christmas

e stools should now be introduced to nth and kept moist and in the dark. strong heat must be avoided, especially st, or the stalks will be very thin and urless.

C. Blair.

ston House Gardens, Linlithgow.

Lindelofia spectabilis

is hardy perennial of the Borage family most useful plant for the hardy border. a compact grower, producing from its stock plenty of leafy stems, each of h carry clusters of blue flowers. It is t 18 inches high and seems continually wer, but is at its best in June and July. ndelofia spectabilis is of easy culture, ing in any good garden soil. It is pro- ted by root division and seed. I find it ioned in an old garden book of 1882 as glossum anchusoides, so it must be an lant forgotten or neglected.

R. Moore.

Camellia magnoliæflora

As winter-flowering shrubs Camellias light up the gloomy days with a wealth of flowers that open intermittently over a long period

Camellias

CAMELLIAS are not grown to anything like the extent they were in bygone years, although, I believe, there are signs that they are again returning to favour, and certainly where there is a house of established plants either in pots or planted out in beds a fine supply of flowers is available for several months of the year. The time is at hand for disbudding, and this should be performed with care and discrimination to ensure a long flowering season. In the case, for instance, of plants showing several buds on a shoot the most prominent top bud can be retained and the smaller removed, and one or two retained lower down the shoot. Something in the way of a stimulant will be needed to help the flowers and encourage quick growth after flowering, for, the sooner this is made, so much the sooner will the wood ripen for another season's display. There is nothing better than giving it in liquid form from a mixture of cow manure and soot, carefully prepared and applied. Any pruning required should be seen to directly the flowering season is over, as growth will then be well on the move. From many queries sent to the Editor of Gardening Illustrated it would seem that bud-dropping is often a source of worry to some growers, but given suitable soil and careful attention to watering it very seldom happens.

E. B.

Cinerarias worth growing

The Cineraria has become, in recent years, a plant that we cannot very well do without for winter and spring bloom. Seldom, nowadays, do we see the old-fashioned varieties of the double-flowering type, such as Mr. Tom Lloyd and others. These were propagated by cuttings, as seeds were not produced in any way like the quantity obtained from single-flowering plants. To-day we have a greater range of colours, for the Cineraria has been kept abreast of the times, losing none of its sweetness, and, in fact, being greatly improved upon. Matador is a first-class variety, with its pink and scarlet shades, although catalogued by leading nurserymen as "brilliant scarlet." Radiata magnifica superba, a variety worth mentioning for size, varies in shades from pure white, through pale pink and rose, to deep rose, scarlet, and crimson. The blue shades are also very fine, from pale blue, deep blue, purple, and maroon. The Stellata variety, particularly Radiatum reflexum, has flowers the colours of which are very numerous. The variety generally called "large-flowering blues" is a very compact grower and the flowers are fairly large, while the leaves are very broad.

When cultivating Cinerarias do not "coddle" them, as plants grown cool—that is, in a temperature of 45 degs.—make the sturdiest growth. Two enemies to be guarded against are Red Spider and Green Fly. Mildew is often another complaint, caused mostly by cold draughts or insufficient ventilation. Leaf-mining Maggot is another pest which is very troublesome some seasons and is, to a certain extent, detrimental to the health of the plant. Hand-picking is about the only remedy for this, although I have found weak liquid-manure given once a week during early stages of growth helped to lessen the activities of this pest.

Chrysanthemum Shows

Bristol Chrysanthemum Show

THE Drill Hall of the 4th Gloucester Territorials was again the scene on November 13th and 14th of this important West of England Show.

If anything, the quality was even better than last year, and a greater number of exhibits were staged—a proof of the popularity and keen interest taken by its supporters; but unfortunately the Hall cannot expand in proportion, and the result was a decided congestion, particularly on the second night.

The whole show reflects great credit, both on the organisers, the competitors, and honorary exhibitors.

So many were the classes, and so numerous were the entrants, that space forbids details of each exhibit and of all the prize winners. The centre of the Hall was occupied by three island groups composed of Chrysanthemums intermixed with Crotons and other foliage plants. Mr. Melville Wills (gardener, Mr. Chipman) was given the premier award, thus winning his own challenge cup. He also gained for 24 Japanese Chrysanthemum blooms the Kemp Brothers' Silver Challenge Cup, Mr. H. G. Newton and Mr. E. W. Bryant being second and third respectively, each with very high class blooms. For 12 blooms Mr. Bryant was first, Mr. Lockwood and Mr. Jenkins gaining second and third respectively.

For a collection of single named Chrysanthemums arranged for effect—an interesting class—Mr. Wills, Mr. Fry, and Mr. Morris gained the honours.

Twelve classes were devoted to Chrysanthemums, and in each the competing blooms and plants were of real excellence, speaking louder than words of the skill, time, and patience given.

Sixteen classes for fruit brought numerous entries, particularly in the Apple and Pear sections. Comparisons between the shapely, well-coloured fruits occupied a considerable amount of the judges' time.

For six dishes of fruit Mr. R. J. Knight was first; for 12 dishes of Apples Mr. G. Pow; of four classes for Grapes (two bunches) Mr. R. J. Knight gained first prize in three, Sir G. Stanley White gaining the first for Lady Downes.

Vegetables were well represented, and a large and most instructive exhibition of honey filled the rifle range attached to the Hall.

For the second year honey has been added to the attractions of the show, and exhibits were staged from all parts of the British Isles. Keen competition was evoked by the Bristol Silver Queen Challenge trophy, a work of art representing a queen bee, exquisitely chased, in silver. Twenty-two entries for this trophy alone were placed. It was awarded to Miss A. B. Flower, of Hale, Salisbury, who also won a silver challenge cup for the highest aggregate points obtained in all classes (honey).

A challenge cup for the highest number of points in the fruit classes was accorded to Mr. R. J. Knight, and Mr. J. Curley gained the most numerous points in the amateur and allotment classes.

Orchids were prominent, especially a g
6 feet by 4 feet, arranged by Mr. Chip
gardener to Mr. Melville Wills. Phalæn
Rimestadiana, Oncidium varicosum,
Calanthe Harrisii were arranged ove
mixed but choice collection of Cypriped
and Cattleyas.

For six Orchids Mr. Wills gained
Westonbirt Challenge Cup, and was
placed first in the class for six Cypripediu
Mr. W. J. Wilkins second. Mr. Wilk
though not employing a gardener, sho
an excellent dish of Pears, first, and was
a winner in some Chrysanthemum classes

The class for two Orchids brought three
trants, Mr. Wills first, Mr. Wilkins sec
and the Misses Wills third. Mrs. L. P.
(gardener, Mr. Thody) was first for a speci
Orchid, Mr. Wilkins second, each showin
well-flowered Cattleya Bowringiana Hyb
Mr. Wills coming third with Cypripedium
signe Sanderæ.

In class 21 Mr. Wills staged a fine Cy
pedium Dreadnought, and also gained a
in the succeeding class for three Cy
pediums, Mr. Wilkins coming second, an
similar position in the class for th
Cattleyas, the Misses Wills (gardener
Grieves) gaining first. For three Oncidiu
Mr. Wilkins was first. Mr. J. F. Phipp
first in the class for three Orchids and
Wilkins second, but in the class for f
Cypripediums Dr. F. J. Cairns was first
Mr. Phipp second. For six Orchids of
variety Dr. Cairns was again first, and
Wilkins and Mr. Phipp second and third
spectively.

The trade were well represented,
majority of their groups being arran
against the walls of the building, and so fo
ing an effective frame to the pictures
arrangement in the body of the Hall.

Messrs. Sutton and Sons had a display
vegetables, Gold Medal; Messrs. Rogers
Sons, Bristol, filled a corner with floral
signs, Gold Medal; Mr. Rowland Ada
Bristol, Silver-gilt Medal for a varied se
tion of Potatoes. Messrs. Sanders, Mes
Keeling, Messrs. H. G. Alexander, Mes

blooms.

shen and Lisvane Chrysanthemum Society

first Annual Show was held in the
y Hall, Llanishen, on November 15th,
see the excellent quality of blooms it
well worth going a long way, and
credit is due to Mr. W. H. Morgan, the
Secretary, Mr. W. Bennett, Chairman,
. H. Pryce, Treasurer, and the General
ittee for the way they organised such
ellent show at the first attempt. Mr.
Farmer, of Cardiff Castle Gardens, and
. Toye, of Coryton Gardens, were the
, and their task was no light one, as
was very little to choose in the exhibits
y of the classes. An interesting feature
show, in addition to the splendid ex-
of Chrysanthemums, was a class where
izes were specially given by Mr. Alan
for a collection of hardy cut
in fruit or foliage, distinct varieties,
strate shrubs suitable for embellishing
rdens in the winter months. This class
ell represented and took up a good deal
ce on the centre tables. The first prize
warded to Mr. D. A. Purser (gardener,
. Jenkins); second, Mrs. Morgan Lewis
ner, Mr. W. Bennett); third, Mr. E. M.
(gardener, Mr. H. Jenkins). In class 1
for the best 20 square feet of Japanese
es, Mr. D. Cory (gardener, Mr. W.
, was first, Mr. J. E. Turner (gar-
Mr. J. Jones) second, and Mr. Alan
(gardener, Mr. M. Hardwick) third.
e best vases of Japanese variety, first,
Gaskell (gardener, Mr. W. H. Pryce);
, Sir Wm. Thomas (gardener, Mr.
. Crouch). For the best pot of decora-
first, Mr. J. E. Turner; second, Mr.
t Robinson; third, Mr. Alan Gibbs. For
st pot of singles: first, Mr. E. M. Hann;
, Mr. A. Gibbs. The prize for the best
in the show was awarded to Mr. W. H.
gardener to Major Gaskell, for a mag-
t specimen of Mrs. Algernon Davis.

W. E. W.

Artistic grouping

last week there was a flower show at
f exceptional beauty. The main flower
f course, at this season the Chrysanthemum, and what struck one as unusual was the use made of decorative Dahlias in big vases, high on pillars above the Chrysanthemums, which were themselves in giant pots on the ground among a grouping of Palms and other very elegant foliage plants. There was no staging—and, to my regret, no labels to name the flowers—but artistically no doubt it was right. The special beauty of these Decorative Dahlias was that they enhanced the colouring of the giant Chrysanthemums beneath, so cleverly were they arranged. With big bronze Japanese incurved Chrysanthemums, for instance, the Dahlias so high up would be shaded from browns to reds and flame colours mixed artfully with a white or cream colour in loose sprays and enhanced the beauty of these giant blooms on 6-foot stems that were standing in these big pots below. It was more like a ball room than a flower show, and yet it combined both. Another striking thing was the daintiness of the tiny Mountain Japanese Chrysanthemums. So well grown were they that there were many plants between 6 inches and 9 inches high with brightly coloured flowers no bigger than the tip of my little finger! There were both single and double varieties, and many of the Anemone-flowered type. They really were fit for Titania's Palace, and contrasted with the giant blooms elsewhere. Their colours were so bright that I am sure they will appeal to many gardeners when they are more largely known. Single or double, they are a striking development of that variable flower, the Chrysanthemum. Before the show was closed the new Chrysanthemums were named by their raisers, and with care visitors could find names for their new favourites. Rhus Cotinus was also much used in some groups as a background.

E. H. WOODALL.

New certificated Chrysanthemums

A Meeting of the Floral Committee of the National Chrysanthemum Society was held in one of the Committee Rooms of the Royal Horticultural Society, Greycoat Street, S.W., on Monday, November 18th, when 15 new Chrysanthemums were submitted for adjudication. There were a few outstanding novelties, each of which received the First Class Certificate of this Special Society. They were as follows:—

TRENT.—A large white exhibition Japanese bloom, having long, broad florets, twisting and curling, and building a flower fully 9 inches in diameter and of great depth.

DESERT SONG.—This is a very large single, having several rows of broad florets slightly indented at the end and of splendid substance. The flowers measured at least 7 inches across. Colour, reddish-bronze, tipped gold.

SUNDOWN.—Another single-flowered sort of beautiful finish, having several rows of florets of medium width, evenly disposed around a golden disc of proper proportions. Colour, deep ruby-crimson. The flowers are almost 5 inches across. These three varieties were shown by Mr. H. Woolman.

VISCOUNTESS HAMBLEDON.—One of the finest acquisitions of the season. It is a large-flowered single, fully 7 inches across, having several rows of florets of medium breadth, very evenly disposed around a small golden disc, building an ideal exhibition bloom. Colour, crimson with a very narrow golden-yellow zone around the disc. Shown by Mr. W. Turnham, The Gardens, Greenlands, Henley-on-Thames.

C. J. WESTON.—A promising Japanese incurved bloom, suitable for market and decorative uses. The florets are of medium width, which, when disbudded, build a useful incurved bloom about 5 inches in diameter. Colour, rich golden-yellow. In spray form it is a reflexed flower, less rich in colour, but distinctly useful to those who need a good spray sort of this colour. Height about 5 feet. Shown by Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow.

D. B. CRANE.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FRUIT

Transplanting a Walnut tree

Would it be safe to move a Walnut tree, height about 15 feet, grown as a standard, stem 17 inches in circumference, age somewhere about 12 years? I proposed taking a trench around, 9 feet or so from the trunk, and working under the tree, and using a tripod and chain pulley for lifting.

S. A. POWELL.

[It is possible, with care and a great deal of labour, to transplant a tree of this size, but there is necessarily always a risk of failure. You will hardly, however, be able to move a ball of earth about 18 feet in diameter. A much smaller ball will suffice. As you work under the tree you will require some stout sacking to be placed under the roots, the ends of which are brought up and fastened firmly to the trunk before attempting to lift it with the tripod, thus ensuring the ball of earth being retained round the roots. Have the new hole ready before starting to lift the tree. We have consulted every available catalogue and cannot discover the deep red Hollyhock you mention.]

Planting Apples

I shall feel obliged if you will advise distance apart for planting Bramley's Seedlings and Cox's Orange Pippins (bush); also depth in red clay soil having shale or rock beneath on hillside (slightly), and shall be glad to know of a good kind of Black, Red, and Dessert Currant trees to plant in a small garden. The soil does not appear to have had any lime or manure dressings for past four or five years. Do you advise same now or in spring, and should like to know best way to apply same?

AMATEUR.

[Being a very strong grower, Bramley's Seedling Apple should be given 15 feet between the trees, while Cox's Orange Pippin should have 12 feet. Do not plant deeply, say, not more than 4 inches. That is to say, there should be 4 inches of soil over the roots. We should not advise manuring the soil before planting, but in a year or two should the trees appear to be wanting in vigour, a mulch of good farmyard manure would be beneficial. Double-dig the ground before planting. Lime is probably unnecessary for the Apples. Good Black Currants are: Seagrave's, Baldwins, and Boskoop Giant. Red varieties: Comet, Raby Castle, and Laxton's Perfection. White varieties: White Dutch and White Transparent.]

Sale of Black Currant bushes

(J. W. Butter).—There are no regulations *re* the removal of healthy Black Currant bushes in England. The appended note appears at the end of the Ministry of Agriculture's Leaflet No. 1: The Black Currant Mite—" Sale of Affected Plants.—The sale for planting of any plants which are substantially attacked by this pest is prohibited by the Sale of Diseased Plants Order of 1922, under penalty of £10. Further information on this subject may be obtained on application to the Ministry."

Diseased Fig

(G. E M., Cranbrook).—The specimen piece of Fig wood was thickly studded with the fructifications of Coral Spot, Nectria cinnabarina, Fries. This fungus is normally a saprophyte, and as such occurs on dead wood of all descriptions. On the other hand, there are many cases on record where Coral Spot has been proved to be a definite parasite. It obtains entry through dead snags of tissue, and on reaching the living wood does not stop, but proceeds until the whole branch dies out. Currants, Apples, Pears, and Figs are often attacked in this manner, especially following faulty pruning. You should cut out and burn all the dead wood from your Fig, and when pruning the living tissue do not leave the snags of tissue, but cut off close to the next main branch or close to a bud so that the cut surface can heal up rapidly. White lead paint applied to all large wounds helps to keep fungi from attacking the cut surfaces.

Manure for fruit trees

(G. Ernest).—A good chemical manure for pot fruit would be one part sulphate of ammonia, one part sulphate of potash, and four parts superphosphate. The ingredients should be thoroughly well mixed together and used at the rate of 1 oz. per gallon of water. Once a week should be sufficient, and the liquid manure should only be given when the fruits are swelling. If it is desired to mix up the above mixture and store, so that liquid manure can be made up at any time, one part steamed bone flour should be added. Steamed bone flour is practically insoluble in water, but when it is added to a mixture it acts as a drier and prevents the manure caking.

Colouring Apples

(G. Ernest).—Apples growing on certain types of soil are always difficult to colour. You say that your land is heavy, and it therefore should contain sufficient potash. On the other hand, you should remember that
gen has the tendency to produce green
lacking colour. Try the effect of cuttin
nitrogen for a season or so, and to make
that the trees are receiving sufficient po
give a dressing of sulphate of potash a
rate of 1 oz. per square yard in February
Keep the trees thinned well to allow ligh
air to circulate amongst the fruits.

Pear scab

(Stewart Jobson).—Your Pear is aff
with Pear Scab; details of this fungus a
control have been given frequently of
In addition to the scab your Pear appears
shrivelling; this is probably due to their
picked rather too soon and having been
in too dry an atmosphere. Please see
to Miss Warren in this issue *re* Apple
If you use Bordeaux Mixture at the pe
stated in that reply you should have no
culty in obtaining control. Make sure
the underside of the foliage is coated.

Diseased Apples

a stokehole, the temperature always abou
degs., in, for instance, a large wooden
containing soil only, as the place is ben
a living room. I should be glad to have p
culars as to operations, if such is practicab

" D. J. M.

[You cannot grow Mushrooms in soil al
but must have the greater part of the
composed of horse droppings. Also the t
perature of your stokehole is too low, f
55 degs. to 60 degs. being the proper war
for this fungus.]

TREES AND SHRUBS

Impenetrable hedge with colour

I want to grow a hedge round a works
to be about 4 feet high and as impenetr
as possible, but to get away from the

et. There is a long length of it. If provides something spiked horribly, ourful, I am after it. There are varie- Plum and of Berberis, but by going to arters I anticipate that I shall get good

ROBT.

re is nothing among hardy shrubs can be used for hedges so formidably as the Japanese Orange, Aegle , and we would defy anyone to get h a 4-foot bush of it without having nd a hospital afterwards. It is laden harming white flowers in spring, each es across, and with orange shaped n autumn which are interesting only. aves, however, before they fall change retty gold and yellow. Its spines are inches to 4 inches long, as thick as ing needle and nearly as strong. Its ult is that it is rather slow in growth its early stages, but once established freely. Another rather formidable plant is the Cockspur Thorn (Cratægus Galli), the thorns of which are rigid, inches to 6 inches in length, and with ked spur at two-thirds their length g out about 1½ inches. Beautiful in magnificent in leaf, colour, and fruit mn, Ilex Aquifolium (Common Holly) peer as an evergreen fence. The Briar (Rosa rubiginosa) always beautind commanding respect when used—ten is—for a fence by the most venture-choolboy. Blackthorn, used alternately erberis aristata, would also prove both ting and effective, and might form a of your fence.]

to obscure unsightly frames

stoun).—Either of the following would your purpose and could be obtained feet or 4 feet in height, becoming effec- once: Cupressus Lawsoniana, Loni-tida (a very fast growing evergreen), or on Yew. Of these, Lonicera nitida is ly best suited to your requirements.

r shrub for screen

stoun).—You could scarcely better a r Ivy trained to a light trellis for such ose, the former being obtainable up to or 5 feet in height and the latter up to nd 7 feet. Either a Weeping Willow, lm, or Birch would, we fear, soon be- o large for such a position.

thus unsatisfactory

—Yes; cut away the barren growths to within 3 inches of the main stem. rther pruning should be deferred until l of March. It is just possible that by the plant down in March to half its height, young growth would develop e base.

ng plants to accompany climbing oses

hard).—The following climbers will not the Roses if removed within the next ears; indeed, the Clematis may remain ently, as the two thrive together: is Ville de Lyon, C. lanuginosa, C. , C. La Lorraine, Actinidia chinensis, oignettiæ, Solanum jasminoides, Loni-agophylla, Lonicera similis Delavayi, ium nudiflorum, Escallonia langleyen- icera etrusca var. gigantea.

g back Clematis

ld the following Clematis be cut back Montana rubens, Jackmanii superba, ern, Nellie Moser, Ville de Lyon, Moser.

"FANNY."

natis montana rubens may be thinned ny time between the fall of its leaves end of February. The flowers appear e wood made during the current year, the necessity of thinning the shoots rather than pruning them all hard back, as to do so is to cut away next season's blooms. Clematis Jackmanii superba and Ville de Lyon should be cut back to within 1 foot of the ground at the end of February. C. Lasurstern, Nellie Moser, and Marcel Moser all flower from short laterals which grow out from the old wood and should be thinned and shortened back somewhat from the top at the end of February.]

GREENHOUSE

Solanums not fruiting

(Archd. Craig).—It is unfortunate that you fail to mention which of the Solanums you are puzzled to get to set its fruits, the family being a large one. Some of them succeed well in an ordinary greenhouse, while others demand more warmth. If you will tell us the variety we will do our best to help you solve the question of your non-success.

Treatment of scarlet Salvia

I have potted up the above and put in my greenhouse. Will you please inform me if and when I can take cuttings of same? They are at present still flowering, but are inclined to damp off this wet weather.

C. C. B.

[Allow your Salvias to finish blooming before cutting the growths back to within two or three joints or buds of the main stem, and keep the plants on the dry side until new growth commences in February or March. The young shoots which follow this treatment should then be taken off when about 3 inches in length, cutting them immediately beneath a joint. These make excellent cuttings which, inserted in sandy soil and placed beneath a bell glass or airtight box covered with glass, will take root in about three weeks, providing the house in which they are growing is not allowed to drop below 50 degs. Curtail the water supply, remove decaying leaves, and air more freely on favourable occasions to check the damping referred to.]

Indoor climbers

I have a lean-to house, heated, 36 feet by 14 feet, with wall 14 feet high, with Vine running on 12 inches from top, near glass. I want to cover the wall with flowering climbers. Could you advise a rapid climber of more than one variety? I can make the border to suit the object.

JURO.

[There are very few plants at all likely to succeed in the position described. We have seen back walls of vineries clothed with some of the commoner Zonal Pelargoniums, while some of the Allamandas would quickly clothe the wall. Then the Bougainvilleas are quick growers and bloom for quite a while. Good turfy loam and leaf-mould will grow all these well.]

Diseased Carnations

(D. McL.).—The diseased Carnation material sent is not affected with Rust. We are incubating the material and will report to you in due course.

FLOWER GARDEN

Alpines in Norway

(E. E. M.).—Norway has quite a rich Alpine flora, but we know of no published work dealing with it. The mountains of Norway contain, among other plants of interest, Saxifraga Cotyledon, Silene acaulis, Dryas octopetala, Azalea procumbens, Saxifraga nivalis, S. stellaris, S. aizoides (two forms), Ranunculus glacialis, Linnæa borealis, Anemone triloba, and many other good Alpine plants, and at lower levels than are customary for such plants further south. Any good Alpine flora would be helpful, as the Alpine flora was originally a northern and pre-glacial one. Even on Spitzbergen and in arctic America the bulk of the flora agrees with that of our high Alpine chains, but the further north you go the nearer do the plants approach sea level. On Spitzbergen, for instance, Saxifraga oppositifolia is washed by the sea. On the whole, these arctic forms are more readily established in our gardens than those from great elevations.

Hardy annuals to sow in autumn

(B. P. Standen).—All the annuals recommended (page 763, issue November 9th) transplant without harm and were specially chosen to meet your wishes, doubtful kinds being purposely avoided.

Anemone nitifolia

(K. G.).—This is a hardy perennial and increases rapidly by means of underground suckers. The flowers are pale pink.

Iris Susiana

When is the proper time to plant Iris Susiana?

E. D. D.

[October is the best month in which to plant this May-flowering Iris.]

ROSE GARDEN

Treatment of Rose beds

Will you kindly tell me what I should do with my Rose beds from now up to the beginning of March in order to put the soil into the highest state of fertility? The ground was well manured last year with cow and sheep manure.

AMATEUR.

[You may with advantage give your Rose beds a dressing of about 3 ozs. per square yard of bone-meal, or, in the event of your soil being very heavy, 4 ozs. of basic slag. Opinions differ as to mulching Rose beds, but we have seen excellent results from applying a good mulch of rough, strawy manure from a stable, this affording protection from severe frost besides supplying a considerable amount of nourishment to the plants. The bone-meal or basic slag should be very lightly forked in.]

MISCELLANEOUS

Stone for moraine

(S. W.).—The sample is granite chips and very desirable for the purpose you have in view, namely, the formation of a moraine.

Stonehenge table and bird bath

(Saxon).—This combined garden ornament in stone (not cement) is supplied by Herbert G. Longford, Abingdon, Berks.

Pests for examination

(E. B. E., Alnwick).—Yes, we undertake to name garden pests for our readers, but in your case we are helpless because the match box and packing material duly arrived, but no sign of the pest. The match box was badly crushed, and we can only conclude that the creatures escaped in the post. If you will be kind enough to send some more specimens packed in a small tin box we shall be pleased to report as to the pest and its control.

Garden lime

I shall be much obliged if you will explain under what conditions of soil lime should be applied to a garden, and where it would be preferable to use chalk instead, what effect they have, and at what time of year should they be applied?

E. D. D.

[Lime is required from time to time in all gardens except those which occur on a natural chalk formation. It is usual to apply lump quicklime or ground quicklime, at the rate of 4 ozs. per square yard, once every second or third year to heavy soil. Chalk or ground carbonate of lime is applied at 8 ozs. per square yard every second or third year to light soil. The lump quicklime should be placed on the floor of a shed and allowed to slake. Spread evenly over the surface of the soil and then lightly fork it in. The ground quicklime or carbonate of lime can be spread as received, but again it should be just worked into the surface layer of soil. Some plants, of course, will not tolerate lime in the soil, and applications to this class of plant should be avoided.]

NAMES OF PLANTS

E. N. Balcombe.—Acer palmatum linearilobum, a form of the Japanese Maple.

L. S. O., Hampstead.—1, Lucombe Oak (Quercus Lucombeana), an ornamental semi-evergreen between the Turkey Oak (Q. cerris) and the Cork Oak (Q. suber). Raised about 1765 at Exeter Nursery; 2, Quercus sessiliflora (Durmast Oak). It occurs on Hampstead Heath, where the soil is sandy, and is frequent in Ken Wood.

L. S. O.—White Beam (Pyrus aria). Also recorded from Hampstead Heath.

M. Cox.—1, Helxine Solieri; 2, Ajuga reptans Rainbow; 3, Sedum spurium; 4, S. aizoon.

H. Mills.—1, Berberis Wilsonæ; 2, Cotoneaster horizontalis; 3, C. Simonsii; 4, Berberis Thibetica.

NAMES OF FRUITS

L. S. O.—Peasgood's Nonsuch.

Mrs. J. W. G.—Apple not recognised. Probably a local seedling, resembling Forge Apple.

A Twenty Years' Reader.—1, Oslin; 2, King of the Pippins; 3, Cox's Orange Pippin; 4, Gascoigne's Scarlet.

S. E. S., Wokingham.—Apple D'Arcy Spice.

Sandy, Walsingham.—1, Seedling not recognised; 2, Newton Wonder.

S. C., Guernsey.—Ribston Pippin.

Scottish National Sweet Pea, Rose, and Carnation Society

"Annual" for 1929

This go-ahead Society has just issued its first "Annual," and it is an excellent little book. There are masterly articles by such well-known authorities as Mr. Wm. Cuthbertson, who treats on "The Development of the Waved Sweet Pea since Countess Spencer," Mr. John A. Grigor, who writes on "The Cultivation of Sweet Peas for Exhibition," Mr. James Kerr on "The Cultivation of the Rose," Mr. John Bell on "The Propagation of Roses," Mr. Alexander McMillan on "Border Carnations and Their Culture," Mr. A. T. Harrison "The Cultivation of the Perpetual Flowering Carnation," and "A Record of Success" by Mr. J. G. Roberts, who gives "a statistical survey of the first ten years of the Society," all of which are most interesting and instructive.

In addition to these articles there is "An Audit of Roses, Kelvin Hall Show, 1929," in which it is interesting to note that Mrs. Henry Bowles was shown 25 times and tops the list, its rivals being Mrs. C. Lamplough and Earl Haig with 19 each. It is rather curious to note that some very widely-grown varieties like Mme. Butterfly, Betty Uprichard, and Florence L. Izzard had only appeared once at this show, while Lady Pirrie, Emma Wright, and Mrs. Wemyss Quinn were shown but twice each.

In the Sweet Pea audit at the same show Pinkie easily tops the list with 57 appearances, Powerscourt (44), and Mrs. A. Searles (42), being the nearest to the leader. Avalanche (13) seems almost entirely to have ousted Constance Hinton, which was only shown twice. Among Border Carnations Viceroy, John Stobart, and Flora M'Iver "tied" with 10 each. Laddie and White Pearl with four appearances each were the most frequently shown of the Perpetual Carnations. What makes these audits so interesting is that every variety shown is named and the number of times it appeared noted against its name.

There is a list of members appended, and some excellent portraits of some of the officials of the Society, including a very good one of the energetic and enthusiastic Secre-
tary, Mr. John Smellie, Westwood Cot
Helensburgh, who is always willing to
to any inquiry regarding the aims and
ings of this Society. It is to be sinc
hoped that the good work so succes
carried on during the past 10 years ma
continued and considerably extended i
near future.
C.

Contrast in the Garden

The value of contrast in our gardens is often overlooked, and what there is occurs in a haphazard fashion, which often fails to have any interesting or arresting effect. This is not to say that contrast planting should be employed entirely—it can easily be overdone—but there should be enough variation to avoid monotony without achieving a spotty and restless result.

To take an extreme example: if you had the furnishing of an estate with trees, you would not plant it exclusively with Lombardy Poplars; these, though beautiful in themselves, would produce an appearance of unbearable monotony. Nor would you plant one of every possible known tree. You would be content with a certain number of kinds, planting them in groves and belts, thickets and avenues, with large stretches of grass intervening, and here and there some particularly beautiful tree as a focus of attention. On a much smaller scale the same principle applies to the garden.

Turning to the border first of all, the question of height obtrudes itself. It is a mistake to put all tall plants at the back, grading the rest, so that the whole thing looks like a grandstand filled with flowers; rather let some of the tall subjects run out into the middle of the border, leaving irregular, wedge-shaped openings for medium-sized things, and keeping low-growing plants for the edge. Above all, plant boldly; the more room you have the bolder you can be. Delphiniums look magnificent when grouped in masses, but naturally this can only be done in large gardens. In the medium or small-sized border, however, groups of six or three will always give a better result than single plants, and contrast strikingly with the less imposing inhabitants of the bed.

Although variation in height is important, differing textures and habits of growth are equally so. The cloudy Gypsophila paniculata and the glossy-leaved Megasea saxifrages are entirely different, both in habit and texture, yet these extremely opposite plants look remarkably well together, each being a perfect foil for the other. Spire-like subjects are most effective when placed near those whose flower-heads are flat and spreading, and tufted ones with those whose habit is more floppy. Catmint, the ever popular, is lovely when interspersed with drifts of Poppies, the silky cups of the latter gaining much in effect through their association with the mauve featheriness of the Catmint. Achillea Eupatorium, with its flat corymbs of yellow rising on tall stems, is wonderfully showy when used among late-flowering Delphiniums, or brilliant blue Anchusas. Globe Thistles and Sea Hollies are useful contrast plants for the border, especially the latter, with their bold foliage and spiny flower-heads of shining grey or steely blue.

Sometimes the value of a dark background is overlooked. White Foxgloves are at their best against a Yew hedge, Oriental Poppies are magnificent in a similar position, and so are Mulleins and Larkspurs. For the same reason the herbaceous border is more attractive when backed with a hedge than with a wall.

For bold waterside planting, Rheums are invaluable, but they should be used with discretion on account of their size. The ma
leafage contrasts strikingly with the del
foliage of Spiræas and Ferns.
Rodgersias, too, not so large but with
lar characteristics, are also valuable fo
water-garden; the variety called tabu
has pale green umbrella leaves, and
beautiful plant. Here Megaseas are
useful, their leafage having a substa
quality which makes them particularly
tive among less assertive-looking pl

in the rock garden it is advisable to he height of one's planting. A few tely tall plants spiring up from a mass growing stuff not only achieve notice nselves, but also emphasise the dwarf er of their companions. Such effects be used sparingly, however, lest re- result in that familiarity which pro- y breeds contempt.

e is no room here to speak of shrubs l, as they constitute a vast family and separate treatment, but the use of Conifers and shrubby Alpines in the rden will enhance its character and a sombre foil for its more brilliant s. The prostrate Junipers will lend an hoary grandeur to any outstanding er which they can drape themselves, toneasters, particularly horizontalis, oduce a similar effect. The dwarf endrons, which are becoming so much ell known than they were, are very ve in their miniature shrubbiness, as the Daphnes and Heaths.

whole subject of contrast is a large d I have only touched the fringe of it. We can make endless experiments in planting and in so doing find our garden work more engrossing than ever. At the same time our gardens will become more interesting to other people, and when our friends pause in whole-hearted admiration before some carefully planned effect, the warm glow of satisfaction which we shall feel will surely be ample reward for all our pains.

Elsie Harriet Raspin.

OBITUARY

CHARLES E. PEARSON, V.M.H., F.L.S.

It is with deepest regret that we record the death of Mr. Charles E. Pearson, age 73, of J. R. Pearson and Sons, Lowdham, Notts., in which business, established 1782, he was a co-director with his brothers, A. H. and J. D. Pearson.

Mr. Pearson met with an accident on the railway line at Lowdham Station on Thursday, 14th inst. He was knocked down by a train at the level crossing and received injuries which ended in his death on the 15th. It was foggy at the time of the accident, and owing to his deafness he was not aware of the approaching train. Mr. Pearson was one of the founders of the trade journal known as the H.T.A. For many years he was the Honorary Secretary of the Horticultural Trades Association; he was also a past-President of that Association.

It is not too much to say that Mr. C. E. Pearson was one of the best-known and best-loved men in the horticultural trade, always ready with a friendly word and fond of a good joke. He will be sadly missed at the Westminster fortnightly shows and at other horticultural meetings throughout the country. All who knew him feel that they have lost a good friend.

LATE NOTES

Tractor trials to include small motor cultivators

The scientific application of agricultural machinery to market gardening in this country is foreshadowed in the announcement that at the World Tractor Trials to be held near Oxford next year special attention will be devoted to testing the efficiency of small mechanical equipment, such as tractor-cultivators suitable for use by market gardeners. It is also announced that the Royal Agricultural Society of England, which is responsible for the Trials, has decided to modify the governing conditions so as to make the maximum entry fee £150 for all classes of tractors and machines. The preliminary announcement of the Trials has attracted widespread attention both in England and abroad, and for the first time in the development of agricultural machinery it is anticipated that British firms will be in a position to meet the challenge of their American and Continental rivals.

The new cigarette wallet

The convenience of smokers has been studied to some purpose by W. D. and H. O. Wills, the manufacturers of "Three Castles" Medium Cigarettes. These are now on the market at 10 for 6d. and 20 for 1s., in what is known as the "Wallet" Packing. This takes the form of a cardboard carton, hinged at the side so that it opens flat—just like a cigarette case. Smokers are thus enabled to extract a cigarette instantly without disturbing the rest, so that the last is as fresh and fragrant as the first. Needless to say, "Three Castles" Medium Cigarettes maintain the high standard always associated with this brand.

How do you buy your BONEMEAL?

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter. Unequalled for all horticultural purposes.

THE ENGLISH GRASS ORCHARD
AND THE PRINCIPLES OF FRUIT GROWING

ARTHUR H. HOARE 32s. 6d. net

gives the first complete account of a subject of rapidly increasing importance and profit. This book, which is fully illustrated, is based on wide practical experience and covers all aspects, including both the horticultural and the commercial sides of fruit growing in England.

Banish grey Winter

Don't let the passing of summer denude your home of bright flowers. Keep a little summer of your own in a glasshouse built by Duncan Tucker (Tottenham) Ltd. Then you can grow your own floral decorations and keep summer colour throughout Winter's grey days.

Let Duncan Tucker (Tottenham) Ltd. know your requirements.

Duncan Tucker (Tottenham) Ltd
ESTABLISHED 1830.
Lawrence Road, Tottenham, London, N.15 2217

A POSTCARD
will bring you a free copy of
DISCOVERY

the magazine which presents modern knowledge with a popular appeal. This is an age of discovery, of progression in all phases of science. Are you keeping in touch with developments, or does your newspaper nowadays contain items which convey little to you?

Does Einstein's new theory mean anything more than a newspaper headline?

Do you know that the King of the Belgians has recently established a sanctuary for the rapidly disappearing gorilla?

Is the great advance in the science of food values and dietetics known to you only by the one word "vitamins"?

On these and many other subjects **DISCOVERY** can keep you informed. Its contributors are experts, but experts who can impart their knowledge in non-technical language. They make their subjects live and invest them with an enthusiasm which the reader shares. The journal is printed on art paper, so that its many illustrations are reproduced with admirable effect.

DISCOVERY is educative without being dull.
DISCOVERY is modern and yet authoritative.
DISCOVERY is distinctive and always up-to-date.

KELWAY'S PÆONIES.
NOW IS THE TIME TO PLANT
KELWAY'S LOVELY SWEET-SCENTED ENGLISH PÆONIES.

Autumn and early Winter are the best seasons for Pæony planting. The Pæony is probably the hardiest of all garden plants. In Canada it flowers in perfection after 80 degrees of winter frost. Send at once for fully descriptive illustrated Catalogue of the most up-to-date collection in the world.

Collections of named varieties, the selection of sorts left to Kelway & Son, from B 18s. per dozen to F 100s. per dozen. Collection C, double and single flowered fragrant varieties—white, cream, blush, peach, rose, amethyst, cherry red, crimson—strong plants guaranteed true to name, 24s. per dozen, 50 for 90s.

"A collection of Pæonies which I got from you 3 or 4 years ago bloomed magnificently this year."

Mrs. —— ——,
Barton Tracey,
Sutton Scotney,
Hants.
2nd November, 1929.

KELWAY COLOUR BORDERS
OF HARDY PERENNIALS
should now be planted.

Sterilise the tre

THIS Winter Wash does
more than clean down
dormant fruit trees — it
really sterilises every inch
of surface, killing not only
clinging insects but eggs
too. The result—absolutely
clean trees next year! Of
all nurserymen,
seedsmen, and
florists.

Tree and Shrub Catalogues for 1929-30

By Sir William Lawrence

very pleasant to find so many English series holding such extensive stocks of s and shrubs which they offer at able prices. My criticisms, which apply ed degree to the various lists, are that ld always be stated—

Vhat is the size of the plant offered, at height it should reach.

Vhether the plant is pot-grown or rom the open ground

Vhether the plant is a seedling, cutting, r, or worked.

cations as to soil, situation, compara- ardiness are very useful, and are supplied.

rdering shrubs, ne is advised to t they have all nts which have d the Wisley of Garden In addition, owing list may gestive :—

es, Acer orni- A. pseudo- us Prince Han- nd A. rubrum, t and the last tumn colour, rince Hanjery ng growth.

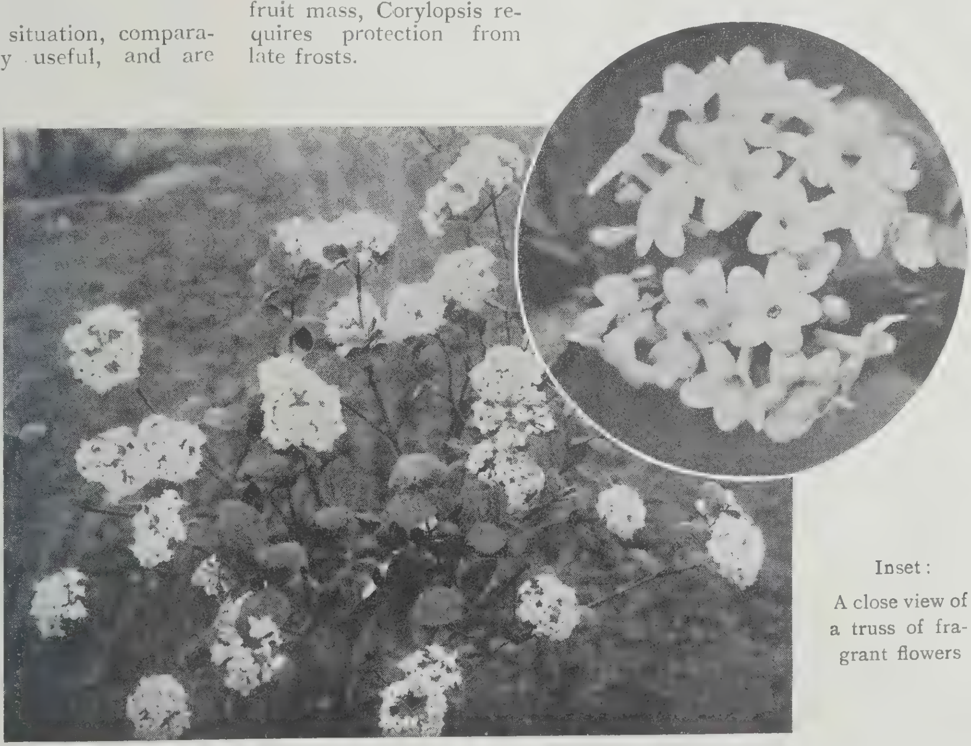
l. s parviflora, v, spreading called " Buck- in America, you are in no that fine tree s indica.

are Berberis number, and all are worth The purple of B. Thun- nd B. vulgaris y handsome. B. Aquifolium ieties Moseri, with coloured foliage, scicularis, an elegant plant, are de- The large Mahonia japonica, of there are two forms in commerce, and hyemalis, is a noble plant, with of yellow flowers arranged like Lily of ley. Weeping Birches are attractive, xt we come to Buddleia, of which, rom the more ordinary varieties, B. olia and B. Fallowiana, the latter with liage, are recommended. For a well d corner B. auriculata, fragrant and ng in November, is worth trying.

aryopteris, C. mongolica is the best, t comes C. tangutica (glutinosa). On Ceanothus see the R.H.S. Gardeners' Diary. Chimonanthus fragrans, "Winter Sweet," surprises us every Christmas; it prefers a warm corner to a wall.

All Cistus are worth growing; my choice would be C. purpureus, C. "Silver Pink," C. ladaniferus if it will stand, and failing it C. laurifolius; C. Wintonensis is a new and very choice variety.

Cornus, Kousa and Nuttallii, and, for early spring flowers and fruit mass, Corylopsis requires protection from late frosts.



Viburnum Carlesii, one of the finest flowering shrubs of recent introduction

Inset:

A close view of a truss of fragrant flowers

Cotoneaster includes rock garden varieties, e.g., adpressa, thymifolia, and humifusa; small shrubs, such as C. horizontalis, notable for its autumn colour, and to be had in a very pretty form with silver variegation; C. Simonsii, which will grow anywhere; C. salicifolia, C. Harroviana, and C. Henryi with pendulous branches; C. bracteata, a good fruiting variety; C. moupinensis, black fruit and fine autumn colour, and finally C. frigida, which forms a small tree, used in making the heads of golf clubs.

Cratægus have been somewhat neglected of late—a catalogue before me does not list a single variety—but are fine as standards, both in flower and fruit; my selection would be C. Arnoldiana, C. Canbyi, C. Carrieri, C. Crus-galli, C. chlorosarca, C. Elwangeriana, C. Jackii, the double scarlet thorn, prunifolia, punctata, sub-mollis, and tenacetifolia.

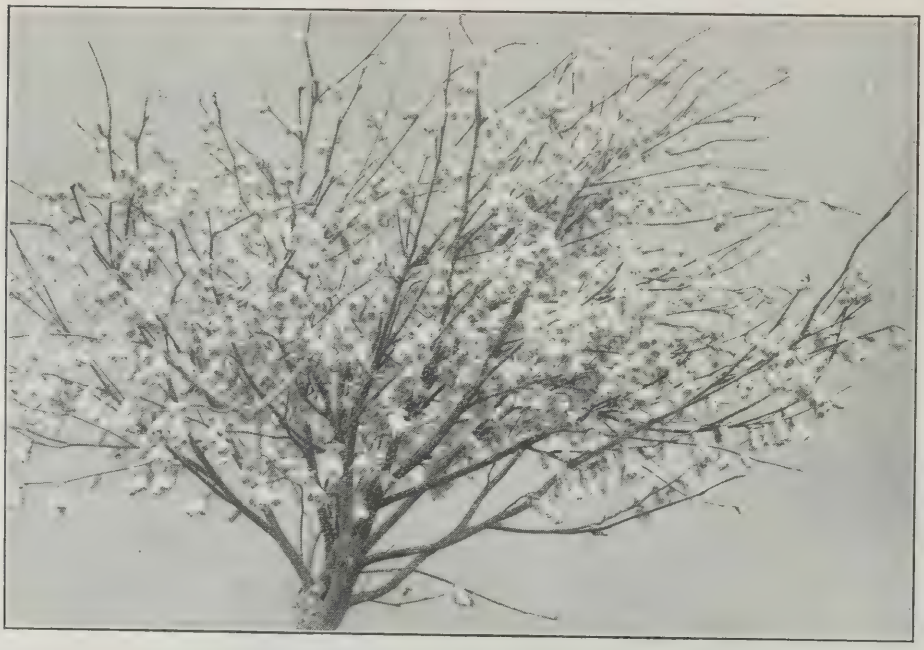
Of Japanese Quinces there are large-flowered white and pink forms which have various names, a variety with white flowers with pink markings on the back of the petals, and Cydonia Simonii, dark crimson, much to be recommended. The catalogues offer a great choice of Cytisus hybrids; unfortunately, the dark-coloured forms, which are very beautiful, e.g., Dallimorei, are not so satisfactory as the old Andreanus. The Daphnes are well known; D. Dauphinii (hybrida) is one of the best, and quite hardy here.

Deutzias — besides the white-flowered hybrids, D. discolor, and D. longifolia (Veitchii) with pink flowers, are attractive. Enkianthus (campanulatus and japonicus) dislike chalk!

Escallonias C. F. Ball, langleyensis, Iveyi, and Phillippiana; Eucryphias, which simply hate chalk, but do well in sheltered gardens, cordifolia and pinnatifolia; Euonymus latifolius and E. Yedoensis are good, but the native E. europæus as seen on the chalk takes a lot of beating.

Forsythias intermedia spectabilis, Fortunei, and viridissima, the latter the latest to flower. Fremontia californica should be planted in a sheltered position, but not against a wall; it likes chalk.

Of Brooms, Genista ætnensis forms a tree, whilst pilosa and sagittalis are prostrate or nearly so. Hamamelis mollis is the finest of the Witch Hazels, and a most desirable plant. Hydrangea quercifolia has fine foliage, and got the A.M. Hypericums Moserianum and patulum Henryi. Laburnums Adamii,



Two illustrations of Corylopsis pauciflora, a densely branched and very floriferous shrub. Cherished for its early spring flowers

the chimæra with three kinds of flower, Vossii, and pendula. Ligustrum—the Golden Privets should be reserved for dwellers in neo-Tudor villas. L. Quihoui is a useful late-flowering plant.

Shrubby Loniceras are better avoided. Magnolias, grandiflora, Exmouth Variety, Lennei—a first-class plant—Soulangeana, parviflora, and stellata form a good selection of easily grown Magnolias. Osmanthus Delavayi for the spring, and for autumn colour the incomparable Parrotia persica. For Philadelphus see the R.H.S. Gardeners' Diary.

Piptanthus Nepalensis and Plagianthus Lyalli both require protected corners, and both are to be had in glabrous forms. Prunus includes Cherries, Apricots, Plums, and Peaches. There are three good varieties of Prunus cerasifera—Blireana, Moseri, Pissarti nigra; the purple leaved Plum P. spinosa purpurea makes an elegant small tree.

There are a host of good Cherries—the double form of the Wild Cherry, P. Avium flore pleno, P. incisa, P. Conradinæ (early), the Japanese Cherries, of which Hisakura (Kanzan) and Mount Fugil (Kojima) are excellent. Nor must we forget P. subhirtella, with its autumn flowering form, P. Sargenti, and the yellow-flowered P. Yedoensis. The fine form of our native Bird-Cherry, P. padus grandiflora, should be in every garden, as should Almonds and Peaches. Pyracanthas—Lelandii, vermilion; Yunnanensis, orange; Rogersiana aurantiaca, yellow.

Pyrus has fruit with pips—Apples, Pears, Whitebeam, and Mountain Ash. There are many good Crab Apples, P. Eleyi, P. floribunda, P. purpurea, P. Veitch's Crab, P. John Downie, P. Golden Gem, P. Ioensis flore pleno (late, with lovely large flowers), P. Magdeburgensis (an Apple), P. Sargentii, P. Toringo, and P. toringoides. Of the Whitebeams, P. Aria majestica, P. pinnatifida Gibbsi, and P. vestita. Of the Mountain Ashes, P. Aucuparia discolor (autumn colour), P. subarachnoides munda (white berries) P. pekinensis (orange fruit), P. Vilmorinii (pink fruit), Rhus cotinus atropurpurea (select the plant in the nursery to secure good colour), and Rhus cotinoides, both for colour. Rhus deliciosus is lovely, and so is the double, sterile form of the common Blackberry. Many Willows are lovely; Bockii has very small leaves and flowers in autumn; magnifica has leaves like a Magnolia; S. babylonica annularis is a curious and elegant plant; S. irrorata, with very white stems, I have been unable to find in English lists. Spartium junceum is a first-class Broom, and nowhere better than near the sea. Stachyurus præcox or S. chinensis are valuable for early flower. Of the Lilacs,
the two species Syringa reflexa a
Sweginzowii are recommended, and
hybrids are Jan van Tol (single
Massena (large single mauve) Souve
Louis Spath (dark red single),
Lemoine (double white), Paul Thirion (
mauve). There are endless Veronicas; A
Glory and Simon Deleaux are lovely, b
too hardy, and Hulkeana is even less

Fremontia californica requires a shelt position and does well on chalk

TES OF THE WEEK

Rock Garden Society

ie first General Meeting of the Rock
len Society will be held in the New Hall
ie Royal Horticultural Society on Tues-
December 10th, at 3 p.m. The business
e meeting will be to appoint the officers
set out the objects of the Society and to
ige the date for the Society's first show
30. All persons interested in the culti-
n of Alpine plants are invited to attend.

Horticultural Club

e next meeting of the Horticultural Club
be held in the Windsor Castle Hotel,
ueting Department, 1, Wilton Road, op-
Victoria Station, London, on December
when Captain F. Kingdon Ward will
e on his recent plant collecting expe-
in Asia. The lecture will be preceded
dinner, 6.30 p.m. for 7 p.m. Non-mem-
especially interested in Captain F.
don Ward's expedition can obtain tickets
ie dinner and lecture (6s. 6d.) from the
Secretary, Mr. G. F. Tinley, 855, Lon-
Road, Westcliff-on-Sea. At a meeting in
ary Sir Daniel Hall has very kindly
ised to lecture on the Florist's Tulip.

of the late Mr. Kirch's Alpines

e late Mr. Kirch's Alpines grown
ckenham were recently sold by Messrs.
ieroe and Morris. There were ap-
mately 25,000 plants in all, and they
ed (apart from the frames and green-
s) about £455. Of these a fair pro-
on were small plants, requiring to be

Highly-flavoured Apples

I WAS very much interested in the article entitled "How to Grow Cox's Orange Pippin," by Mr. Laurence J. Cook, issue November 16th. I quite agree with all he says about the management of this choice Apple, which is considered a bad doer by many growers. There is no doubt that it is much the best when grown on the Paradise stock, and should never be planted without some other variety, such as Worcester Pearmain or others that bear fruit freely in the vicinity. Over-pruning I also find detrimental to a good crop of Cox's, and the most sheltered and warmest part of the garden should be chosen, and it is well worth a southern wall. The best crops I have ever seen were grown in such a position.

An indispensable shrub: The Moonlight Broom (Cytisus scoparius pallidus), clothed with long sprays of pale sulphur flowers

Having read the list of others that he gives which have decidedly good flavours, I should like to add several which I consider the best flavoured bar Cox's and James Grieve. The first one I am going to mention is Egremont Russet. Eat one of these about the first week in November and you will be sure to have a feeling that you must have another. The flavour is denoted by its excellent nuttiness, while the flesh is very crisp. The tree in itself is neat in growth and very fertile, and very suitable for a small garden where only one dessert variety is required. There is also no doubt but what it is choicest of all the Russet family.

American Mother is an old variety that is not so largely known as it should be. Probably a good deal is due to the dullness of the fruit, but the flavour of them is all that can be desired for those who know a real good Apple. This also is in season during November, but will keep well up to Christmas if harvested right. It does best on the Paradise stock.

St. Cecelia is a fairly new Apple that was raised by the late Mr. J. Basham, of Bassaleg, Monmouthshire, and is one of the very best Apples that anyone could wish to have during January and February; it has the true Cox's flavour, and can be relied upon to succeed well where Cox's Orange fails. It is medium in size, fairly oval in shape, and the colour is golden yellow, with a crimson flesh and stripes when ripe. The tree is compact, and is clean and healthy, and I can recommend it to any readers who want a real good follower to Cox's.

Pitmaston Pine Apple. This is an excellent flavoured Apple, not known so widely as it should be. It was raised at Witley, in Herefordshire, about 70 years ago, and I am afraid there are few nurserymen who grow it to-day, but it may be found growing as large old standards in many orchards throughout the midlands, bearing well year after year. The fruit is not very large, is conical in shape, golden yellow with russet, and red flesh.

Cornish Gilliflower. I had to go to a deal of trouble some years ago to obtain a stock of this old favourite, but to grow it well it must have a sheltered part of the garden or orchard, and requires careful pruning, as it bears most of its fruit on the end of the branches, so it should be grown either as a standard or half standard. The fruit is medium in size, oval, and markedly ribbed round the eye, greenish yellow, streaked and splashed dull red and Russet, while the flesh is pale yellow, sweet, and very rich. It is one of the best late keepers we have, although it is quite fit to eat in December.

Claygate Pearmain. Probably the best of all the winter Pearmains, and one of the best for an orchard standard. The fruit is of a typical dessert size, dull russet in colour, richly flavoured, tender flesh, one of the best if well ripened before gathering. The tree is fertile and bears regular crops. Another excellent old good flavoured Apple, well worth growing in an orchard, is Wykeham Pippin. Not very large, flattish round in shape, and greenish yellow when ripe, and will keep well into March.

Joybells. Although I have not grown this fairly new variety personally, I believe from what I have seen and learned about it it is one of the coming varieties that has exceedingly good flavour. W. E. WRIGHT.

Gardening in the Sudan

Very many of us who garden in England had good reason to complain of the great drought last summer, but we have nothing to endure like those who garden in the Sudan. A relative of mine resident there has written to me as follows: "Locusts have been a terrible curse in the Sudan. One flight alone was 40 miles long. The Air Force ran into one swarm over a mile wide and 4,000 feet thick. As you can imagine, the locusts don't leave much."

Notwithstanding this terrible drawback, the enthusiastic Governor of Wadi-Halfa, with a few kindred spirits, formed a horticultural society which is affiliated to the R.H.S. Last summer they had their first Flower Show, which was a success. Now they have 7 Challenge Cups for competition at their next show, which is expected to be an advance on last year's.

I feel sure that many of your readers will join with me in wishing the Wadi-Halfa Horticultural Society the success it so well deserves. B. NEWBURY.

The Rock Garden Society

I think anyone who read Sir William Lawrence's charming letter (issue November 9th, page 751) must feel a great desire to join the Rock Garden Society which is just being formed.

I am sure the Society will appeal to many who, under ordinary circumstances, have not much opportunity of getting in touch with their fellow Alpine growers.

We all have a certain amount of treasures collected or sent from abroad, and sometimes one has seedlings or cuttings, which one would be glad to exchange with other amateurs.

It is very true what Sir William says, that a real lover of Alpines can have a most interesting and instructive garden in a very small space. Not long ago I spent a most interesting two hours looking at Alpines in a tiny suburban back garden, many better grown than I have seen under what one wo were more favourable conditions.

I should like to make one su which is, that members of the Rock Society should be allowed, on produc membership card, to be shown ov member's gardens. It is a tremendo est and pleasure to see a collection grown rare Alpines, and though most are thrown open one or two day year for the hospitals, it is not alw sible to go on those particular dates.

Godstone. N.

Pyrus floribunda purpure

A blue sky and bright sun in Nov rare, and to-day a garden stroll re welcome sight. The fruits of this "flowering" Crab stood out against with dazzling effect. The young fru and purplish, but as it ages it gro scarlet, and now has the colour an the form of a Napoleon Cherry.

Why do the blackbirds, which have cleared off every berry in th save the Berberis fruits, leave this so alone? The ground below is litte fallen fruit, but all so far uneaten.

Do other growers of this tree find t

Photinia villosa

brilliant autumnal colouring, few mem- the order Rosaceæ can compete with all deciduous tree. In private gardens rely seen over 20 feet in height, often less. The corymbs of white flowers, on branches slanting upwards, open in In any other season, they might be ive, but are then inconscpicuous among ny trees and shrubs in bloom at that The leaves are small, ovate-lanceolate e, downy; but towards the middle and October they gradually change from to bronze and so on to the most vivid d scarlet. The oval fruit, one-third of h in length, ripens at the same time rns to a glassy, brilliant red.

e seed is sown the same autumn it ates freely the following spring, and, avourable circumstances, the offspring grow into vigorous, healthy plants, nnual shoots a foot or more in length, fferent from specimens grafted on the orn. One such tree known to the was planted about 25 years ago, and, ood cultivation, is to-day only about n height, with short, gnarled, spread-anches.

lings raised from this plant about 10 ago have long since surpassed it in , their foliage colouring perfectly each thus disproving the assertion often made that it only does so when the Photinia is grafted on the Hawthorn. J. Comber.

Nymans Gardens, Handcross, Sussex.

Lilium giganteum

This handsome Lily is a native of the Himalayas; it also grows in quantity in Hupeh and Yunnan in China, where it is found in the open glades of mountain forests; there it enjoys the cool conditions and partial shade. The strong, straight stems may reach a height of 10 feet or more where the soil, position, and climatic conditions are ideal, but are more often seen from 4 feet to 6 feet high, well furnished with large cordate leaves, which gradually diminish in size as they ascend the stem.

Lilium giganteum flowering in a northern garden in August

The flowers, which are funnel-shaped, are 5 inches to 6 inches long, the segments spreading out at the tips. The bold racemes may carry from six to twelve flowers, which are very sweetly scented; these vary a little in colour, but are usually white, tinged with green on the outside with conspicuous bands of red in the throat.

In choosing a site for this handsome Lily, try and give it a position similar to its native habitat, that is, in partial shade in the clearing of a woodland, but free from the drip of trees and strong-growing roots, where it may be protected from cold, cutting winds by a ground covering of low-growing shrubs or Ferns; thorough drainage is essential. It enjoys a good depth of rich soil, made up of 2 parts of fibrous loam and 1 part of leaf soil, with a good dash of coarse sand added and well mixed together; it also benefits by a good layer of well-rotted cow manure placed a foot or more under the surface.

The bulbs should not be planted deeply, which is very often done; they ought to show the tips slightly above ground after planting is completed, which is best carried out during October, placing a good heavy mulch of rough leaves over the bulbs during the winter. The most satisfactory way is to plant bulbs of various sizes, which may be purchased in three sizes, that is, first, second, and third. These vary a good deal, and flowers may be expected in from two to three years from the smaller size, whereas the first size may produce flowers the following year after planting. When this happens they produce small side bulbs, which, in the course of a few years, will flower and, therefore, perpetuate the race of this noble species.

Lilium giganteum may be raised from seed, but it generally takes five or six years to produce flowers from the time of sowing.

J. A.

A greenhouse climber

In reply to "Juro's" query for a flowering climber to cover a small greenhouse wall, I suggest a Cobœa scandens. It grows very rapidly, and if the point of the main stem is pinched out when it has reached the desired height, it will throw out laterals and will soon cover a large space if given wires or strings to cling to. Beyond having good earth in the border when planting, and a good soaking of water from time to time in dry, warm weather, it will bloom freely all summer, and its pale green bell flowers turning to purple are very effective and interesting. I put in my plant last April, and it is still blooming. F. Mordaunt.

Bournemouth West.

Origanum hybridum

This is a delightful little plant for the rock garden, which I grew for many years, but have not at present, through losing it during a removal. I grew it on a level terrace of rock work, about a foot above the ordinary level and in sandy soil with a south aspect, and shielded from north and north-west winds by rock work above. Here it lived for a number of years, and was always an object which gave me great pleasure, although its beauties did not seem to strike the ordinary garden visitor. Its beauty is of a quiet character, but its leaves are pretty, and the character of its flowers leaves nothing to be desired in the way of their form and pleasing colouring. It never made much increase with me, but was always enjoyed, especially in the late months.

It often lasted into November, and it was a pleasure to go round among the few flowers then in bloom and to come upon this little group of Origanum hybridum. I have grown a few others, such as O. Dictamnus and O. Tournefortii, but none of them pleased me so well as O. hybridum, whose origin I do not know. It is said to be synonymous with O. pulchellum and O. Tournefortii, but it is not the same as the O. Tournefortii I have had. It is also said to come from the Levant. Farrer says nothing about O. hybridum, and considers O. pulchellum and O. Tournefortii to be distinct. S. Arnott.

Lantanas

The Lantana is one of those things which is now under eclipse. I can remember when it was largely used in the flower garden, and, given a warm, rather dry season, beds of Lantanas were most attractive. They were equally valuable for greenhouse work in late autumn. Plants are easily grown into neat little pieces, which remain effective for a very considerable period. Stock plants are easily wintered in a cool greenhouse, but it is necessary that they be kept fairly dry. Propagation is a simple matter; young growths root very readily in spring, and there is little difficulty in working up a stock. There are numerous varieties, ranging in colour from white (or nearly white) to pink, yellow, scarlet, and crimson. W. McG.

Mabie.

Plant Hunting in the Balkans

By Hugh Roger Smith, M.D.

FROM Pec, to which we had descended after our climb of Kopravinik, we drove early next morning to the town of Prizren, turning aside on the way to visit the monastery of Decani, the most celebrated monastery in Serbia. We were most hospitably entertained to lunch by the Archimandrite, who afterwards showed us the beauties of the really fine church. It is a most imposing building, with a wonderful west door. Inside the walls are covered with old frescoes, and there is a great deal of fine wood carving. Amongst the many interesting ornaments in the church are two enormous painted wax candles, 10 feet high, which were presented to the church, we were told, in 1338, on the understanding that they were not to be lighted until Serbia was a free country. The ceremony of lighting them was carried out by King Alexander in 1924 amidst huge enthusiasm.

We arrived at Prizren late in the afternoon, and we left early next morning, so had no opportunity to investigate it at all, which was a pity, as it is an interesting old town, beautifully situated on the side of a hill which is dominated by an old Turkish fort, now used as a barracks. At Prizren our party divided, two making for the Albanian frontier to climb a mountain over the border, while three of us drove to Urosevac to climb Ljuboten, a fine imposing-looking mountain of some 9,000 feet. We called on the Captain of Gendarmerie, and over the inevitable coffee discussed our plans. The officers were most kind, and took no end of pains to make things comfortable for us.

They refused to let us go without an armed escort, and secured two soldiers, one of whom spoke English, and they telephoned to Gotovusa, a little village at the foot of the mountain, to have three horses ready for us and an extra soldier who was to act as guide and who turned out to be a jovial Turk, who spoke nothing but Serbian, of course. After an early lunch, we started off, five in the car and one soldier standing on the step. About a mile from the town we had to ford a considerable stream, and the car stuck hopelessly in the deep mud and had to be pulled and pushed out by men who were hanging about and evidently waiting for just this sort of thing to happen. The road was very bad and about half-way to our village became impossible for a car as it was under much-needed repair, so there was nothing for it but to unload our tent and luggage and send the car back. The gendarmes commandeered a wretched little donkey and a pony that were working in a field near by. On to the former was piled our tent, sleeping bags, and luggage, and I rode the pony and experienced for the first time the discomfort of riding on a pack-saddle, a large wooden erection balanced on the pony's back and which tended to slip round on any sudden movement; stirrups there were none, their place being taken by two bits of string, up and down which one's feet slipped helplessly; reins were represented by a piece of rope tied round the animal's mouth, and the single end given into my charge. With this contrivance I had, of course, no control over the beast whatever, and I was obliged to let him go his own sweet way.

On reaching Gotovusa the luggage was transferred to a horse and the ascent began. We were quite an imposing party with our three soldiers and three men with the beasts. The track was incredibly steep for a horse, but the animals were absolutely sure-footed, and after about two and a half hours' climbing we reached our camping ground some 6,000 feet up, and were comfortably settled in our tent before the rain came down in torrents. Our wretched men had no shelter whatever, but they lit a big fire under a tree and seemed quite cheerful in the morning, which was raw and misty.

We were off at four in a fine drizzle which soon turned to heavy rain. We soon came upon Dianthus inodorus and quantities of Bruckenthalia spiculifolia, which takes the place of Ling on these mountains, a specially fine form of Geum montanum was abundant, and the real treasure Geranium subcaulescens with its crimson flowers and black stamens made most vivid splashes of colour on the hillside. A little higher we found Dianthus gelidus. My hip, which had been badly strained by the pack saddle, was now so painful that I was obliged to turn back before reaching the final screes. My companions, continuing the climb, found on these screes Saxifraga thessalica, scardica, exarata, moschata, and oppositifolia, the rare dainty Viola heterophylla, Dryas octopetala, and a beautiful Anemone of the narcissiflora type.

The descent from our camp was even more trying than the ascent, and at the village I was fortunate to find a post cart to take me to our car, as I found I could not walk. The stream had swollen so much that th

land tortoises, and now and then we the brilliant blue Roller, that, on the eminds one of a large Kingfisher, and nty Hoopoe would rise from the road 50 yards and settle again, its charac- crest shooting up as soon as it touched und. Nightingales were singing every- and the soft call note of the Golden was frequently heard, though the shy as seldom seen. Golden Eagles were ous, and we saw as many as five in the once, and occasionally a great Griffin sailed overhead.

day, June 22nd, the rest of the party f at 4 a.m. to climb Peristeri, a 8,000 ak to the north of the town. I was lame to climb, and spent the day up our plants and exploring the ing town, which is thoroughly in character. The various trades are ected in special streets; one will be vith coppersmiths, another saddlers, carpenters, and so on. There are mosques, one or two really beautiful gs.

climbing party returned at four, their finds being Campanula abietina, to this mountain and the neighbour- Geum pseudo-coccineum, Gentiana ii, Ranunculus crenatus, and a lovely Pink.

a cup of tea the indefatigable Dr. and iuseppi and Mr. Ingwersen started off 50 mile drive to Ochrida to climb ca, while Dr. Seligman, our Serbian and the writer pushed off early next g for Kajmaktcalan, a 8,000 feet peak Greek frontier. The road led across n through some big marshes, and here Storks were walking and the pretty lossy Ibis, the sacred bird of Egypt, huge water buffalo, largely used in n Serbia as a beast of burden, and usually the most miserable animal I have ever seen, was here looking quite happy wallowing in the bogs. The Governor of Bitolj, a charming man who was indefatigable in making our tour comfortable and easy, had supplied us with one soldier, and at the picturesque village of Skocivir, at the foot of the mountain, we picked up another, and then began the most wonderful ascent by a series of great hairpin bends. The road was a great engineering feat, but the surface was the worst I have ever been on, and it is a marvel that the cars can stand it. The road had been cut up by heavy traffic during the war, for the mountain was held by the Bulgarians, and the taking of it by the Serbians by a frontal attack, in which they lost 17,000 men, was the turning point of the war in that part of the world. Half-way up we stopped for lunch, and here we found one single plant of Campanula speciosa with great upstanding flowers like Canterbury Bells of the palest of pale blues. Also Campanula Laurii, distinguished by its bulbous roots, and great quantities of Pyrethrum.

After a most exciting drive we reached the gendarmerie station some way below the summit in a dense mist. After a cup of coffee, I set off with our Serbian friend for Belo Grotto, some four or five miles off, where Ramondia Nataliæ was reported to have been found. The collecting of this plant was our main object in visiting this mountain. We searched diligently, but never saw a trace of Ramondia; however, we were rewarded by quantities of Lilium carniolicum and the striking Geranium subcaulescens and quantities of the dwarf Dianthus found on Peristeri and so far unidentified. It is a delightful plant, with almost sessile flowers, which grow in such masses as to completely hide the short leaves. I found three pure white specimens.

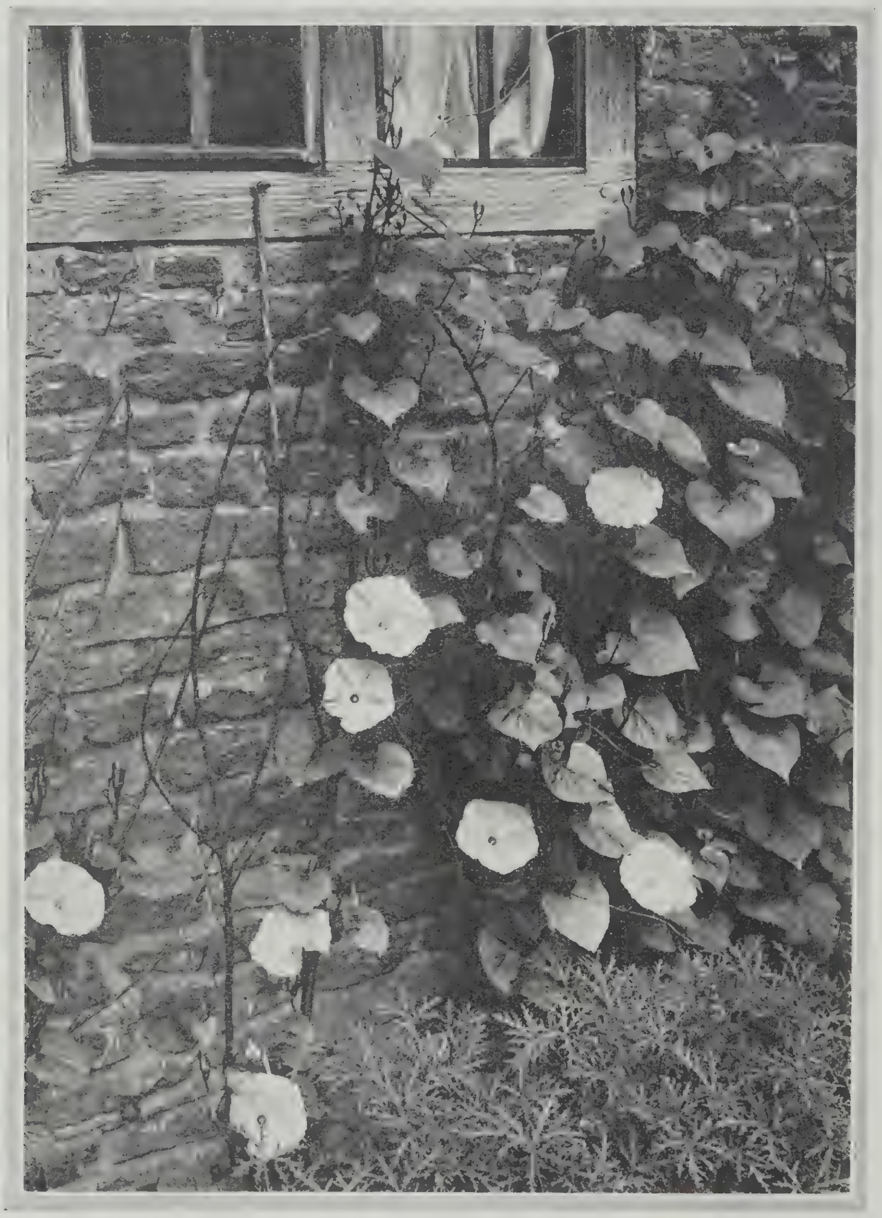
We got back to the gendarmerie after a five hours' tramp to find the cook engaged in making a wonderful soup, and, after an excellent meal, were made comfortable in one of the gendarmes' dormitories, the men giving up their beds to us. These rooms are absolutely clean and there is no trace of any vermin. Next morning early we were off with a gendarme who had fought for the Austrians in the storm troops before Verdun, had later been taken prisoner in Italy, and had then volunteered to join the Serbian army, and was in the final attacks of the Serbs. We climbed up to the Greek frontier and had coffee with the gendarmes and wandered along the frontier ridge and climbed a limestone peak, where we found a very beautiful Androsace of the villosa type, but far larger in the flower. The ground was carpetted with Gentiana verna angulosa, a dwarf Iberis, and a small yellow-flowered Alyssum. We dropped down into a gully in the hopes of finding the Ramondia, but again we were unsuccessful; however, we collected some interesting Sempervivums, arenaria, Reginæ Amaliæ, patens, and others; here, also, was Scorzonera rosea, the brilliant Linum flavum, the scarce Campanula saxifraga, Edrianthus graminifolius, and Kitæbeli, and, in the damp, shady places, quantities of the brilliant Geum pseudo-coccineum.

The return journey down the mountain by car was quite unpleasantly exciting. On reaching the village of Brod in the plains, we were fortunate enough to see a wonderful dance of some 50 men and women, all in their striking National costumes, for this was the orthodox Whitsunday. The heavily embroidered red and white dresses of the women were very attractive, and many were liberally covered with silver ornaments. This was a pleasant ending to a most profitable and enjoyable expedition.

Morning Glory

No plant is better fitted with a popular name than the good form of Ipomea rubro cœrulea, which is now to be had from our leading seedsmen. Until the last year or two it appeared that they had difficulty in securing stocks of the right plant (in the garden sense), for formerly, whereas the right plant did come sometimes, there was, more often than not, the disappointment of having a rampant creeper that gave a mass of foliage but no bloom within the duration of an English summer. It may safely be said that, among all our garden flowers, there is no other blue that is so perfectly blue or so entirely satisfactory in its purity of colour, quality of tone, and simple and unquestionable loveliness. The photograph, that shows about one-third of the group, was taken near the end of August, when only a few flowers were out, but all through September they increased in number day by day, till towards the end of the month there were no fewer than 80 blooms at a time, and a mass of buds promising even more till some night frosts early in October ended the most brilliant display of this wonderful plant that we have ever had. The seeds are sown in heat and are only planted out when all danger of frost is over. They were on a western wall, a better aspect than one more southerly, for the flowers show distress as soon as they feel the sun, which comes round to them between 12 and 1, though on cloudy days they last until the afternoon. But for their perfect vigour and freshness they should be seen quite early, or, at any rate, in the earlier hours of the forenoon.

G. J.



Morning Glory (Ipomea rubro-cœrulea) on a western wall

Tuberoses

Tuberoses (Polianthes tuberosa) appear to have lost caste in these days, yet their white, sweetly-scented blossoms are usually welcomed by those to whom Tuberoses appeal, and the earliest of these, the African bulbs, are now available, and ought to be potted up without delay. Let them be plunged, if possible, in bottom heat—a Melon pit from which the crop has now been cut is the very place for them. Give no water at all until top growth appears, but in order to prevent the soil on the surface from becoming too dry, a layer of Cocoa fibre may be used as a top dressing. Any ordinary potting compost suits the Tuberose.

THE FLOWER GARDEN AT THE MANOR HOTEL, HINDHEAD, SURREY

Dahlias in the foreground and a restful lawn and garden in the dell beyond. Among the large decorative Dahlias in the picture are Porthos, of violet-purple hue, a very distinct colour; Orange Boven, rich orange, in long stiff stems; and Mrs. Carl Salbach, rosy pink with cream bar.

A pleasing picture of the Water Lily pool. On the right-hand side of the pool are moisture-loving plants, including Iris Sibirica, Lobelia cardinalis, and Astilbe Davidii.

One of the well-arranged herbaceous borders, containing impressive groups of Perennial Phloxes, Michaelmas Daisies, Heleniums, Chrysanthemum maximum, Delphiniums, and Lupins.

course, masses of colour should be reserved for large and expansive borders and the collection in small borders confined to single specimens. It should also be noted that all plants do not need the same space, and a compromise may be effected by planting Liliums, Gladiolus, Salvias, Aquilegias, and others in groups of three, while single specimens of the larger subjects like Phlox and Astilbe will suffice. In a large border, the size of the group should be regulated according to the space available; three should be the minimum number of plants, and irregularity of shape and size should be the aim. For the collection forming the edging, similar conditions apply, but when arranging the number of each plant it must not be forgotten that several species increase rapidly and are difficult to keep in their allotted portion after a year.

Some plants are rather backward in establishing themselves in the ordinary garden soil, therefore a compost should be made up for them, consisting of two parts turfy loam, one part decayed manure, some wood ashes, a few handfuls of silver sand, and a 6-inch potful of bone-meal to a barrowload of the compost. Place a layer of the mixture below the roots, press gently, and fill up the remaining space with the soil taken out of the hole. This, of course, is a little extra trouble, but the results are well worth it. F. H.

Notes on the Carnation Show

THE thirty-seventh show of the British Carnation Society held at the Royal Horticultural Hall on November 20th and 21st brought to light some interesting novelties (in several new shades of colour), and the fact that amateurs can show at this season of the year a fine grade of flower. Indeed, the cultivation, not only of flowers from private gardens, but also from amateurs who do not employ a full time gardener, showed a marked improvement on other years.

The Challenge Cup offered by Lord Howard de Walden for 12 plants had two competitors, the winning group being sent by Lady Emsley Carr. The cultivation of these showed that the plants had been grown with plenty of air—the stems were stiff and the foliage glaucus. Mr. Doe, the gardener, may be congratulated upon them.

The Reginald Cory Cup for 100 blooms was won by Mr. Samuel Walrock.

Lady Emsley Carr was again the winner for the Stuart Low's Novelty Cup. We noted some Sir Philip Sassoon as large as that wonderful old variety Carola, which latter, although discarded by most on account of its bad habit, has never been excelled in size.

Mrs. Walter Burns' gardener, Mr. Wright, scored well with his Topsy, which were exceptionally fine, and Lady Lisburne was also successful in several classes.

Representing the amateurs, Miss Simpson, coming all the way from Lancashire, had some really fine flowers that would have done credit to a professional grower, her White Pear being especially excellent.

The dinner table class for open to all members showed much variety in arrangement. Instead of the low style usually favoured, the judges awarded first prize to a table carrying a tall centre-piece carried on a pedestal, which did not obstruct the view of the person opposite. We were much charmed by an arrangement by Mrs. Swan, of Haywards Heath, which included fancy orange varieties of varying shades that toned.

In the trade classes for colour, Messrs. C. Engelmann, Ltd., and Allwood Bros. were successful competitors, Mr. H. T. winning in the class for scarlets with trum.

Ivory won in the white class, Laddie light pink, Gladys for a medium pin Betty for deep pinks.

Topsy scored among crimsons, and Allwood among the Apricot shades.

Three Gold Medals were awarded three non-competitive groups from Engelmann, Ltd., Allwood Bros., and Low Co.

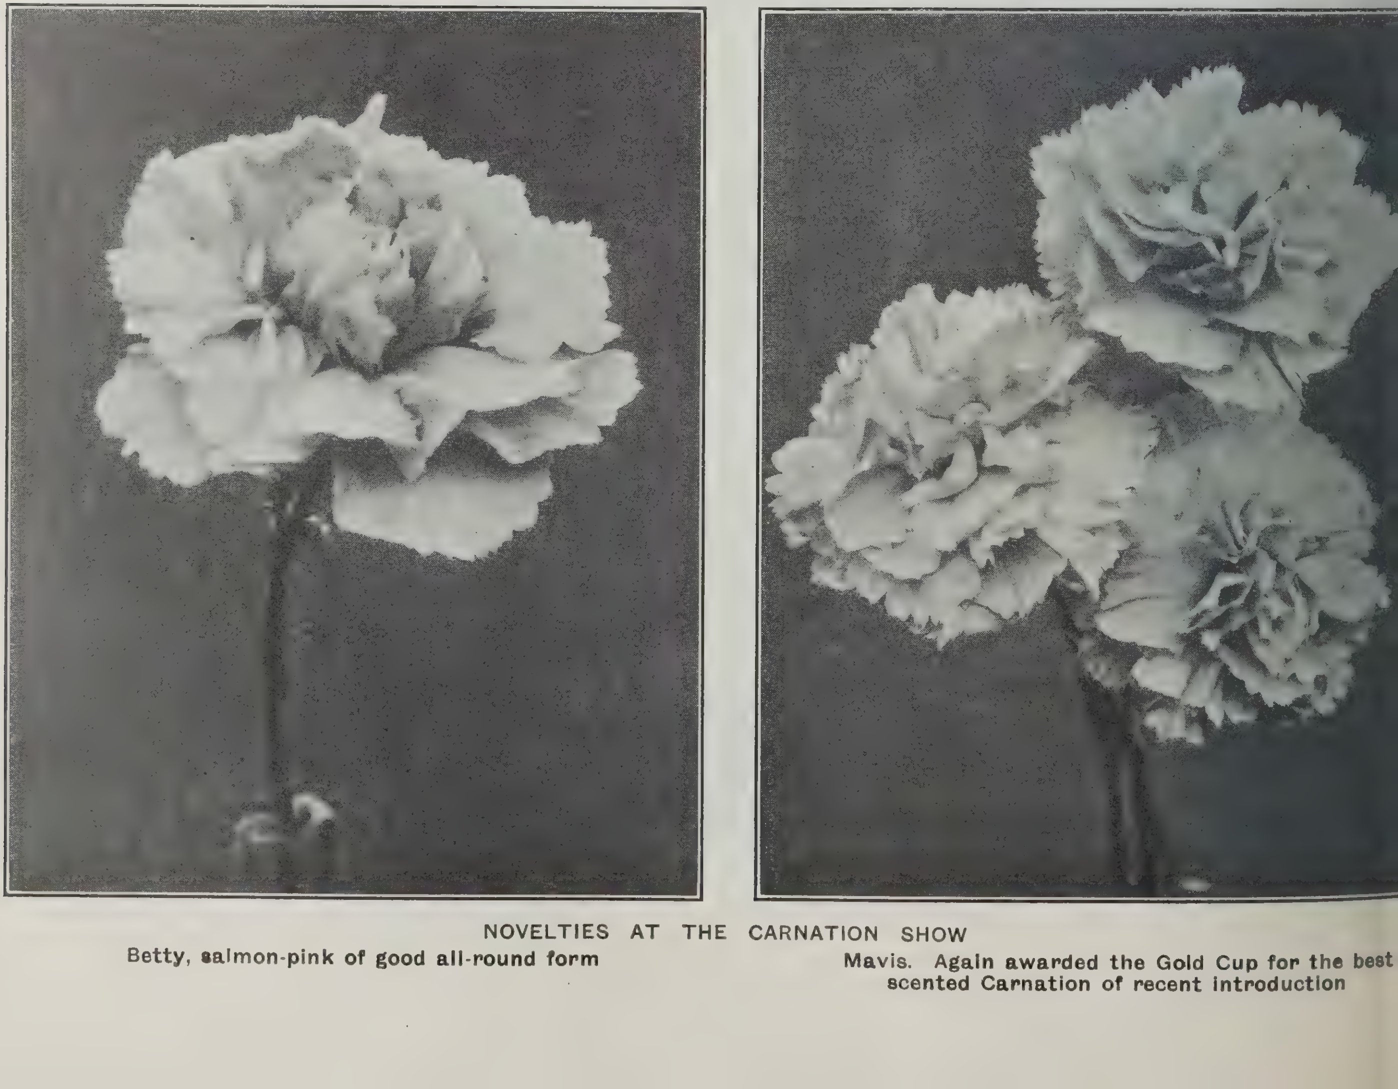
Mr. C. Engelmann had two very ch fancy varieties in Madge, orange, p carmine, and Sunny, deep orange, s chesnut red. Citron, pale yellow, w good.

Messrs. Allwood Bros.' best varieti Wivelsfield Buttercup, a well-formed yellow, and Rapture, bright rosy s Guy Allwood is a pretty salmon.

Messrs. Stuart Low Co.'s grou the bright orange flame Dandy, Mrs. Grant, an unusual shade of old rose berry, and terra-cotta, but the new Mrs. Wyndham Pain, stood out as t among their several purple varieties.

While the show was well attended a successful from the point of view of hibits, it was distressing to observe th the flowers had been spoilt on the seco of the show through the over-heated sphere of the Horticultural Hall. Wh write, we have on our table flowers came from the previous R.H.S. meeti weeks ago. The variety is Sheila which will actually keep three weeks being cut, yet the same variety was sp two days at this show.

The Gold Cup offered by the Dail for the best scented Carnation not in merce before 1927 was awarded to whose grower will not sell plants as he to retain them for cut flower purposes.



NOVELTIES AT THE CARNATION SHOW

(By permission of the Ministry of Agriculture)

Vinter Washing of Fruit Trees

RHAPS the most important winter rk amongst hardy fruit is that of nter washing. As we pointed out last , the use of caustic soda and potash for ork has been very largely superseded use of tar-distillate materials. The ustic washes had the advantage of ng the trees of Lichen and Moss, but tle effect on insect life, except that the l harbour for hibernating insects was ed for the following winter. Another which had to be considered with the washes was that if used every year ect of the wash was injurious to the and many hidebound trees could be as a result. Tar-distillates are now mon use, and they clean up trees nearly l as the old caustic wash. If used at orrect strength most hibernating res are killed. Eggs of aphis are killed ge numbers, and a fair control is ob- over caterpillar eggs. Further, we of trees which have received tar-distil- ach year for six years, and we fail to any sign of bark injury.

re are now many types of wash on the t which, according to the official trials l out at the various research stations xperimental fruit plots in various s, demonstrate that some makes of tillates are better than others with re- their egg-killing power. As experience ed, all makers are constantly improv- eir product. We notice the price of tandard makes shows a considerable re- n on last year; this is a step in the right on because we have always thought lthough most makes were efficient, the applying was heavy.

strength of wash used will depend upon nd of tree, and also the type of insect which the wash is being used against. akers' directions should be carefully ed with regard to strength. In a general per cent. strength will harm no kind dy fruit provided the buds are dormant; strength the majority of aphis eggs are ; at least, this is our experience. Up per cent. is frequently used for Apples, ally when the control of caterpillar is d.

Tar-distillates are best mixed in wooden vessels, and it is a good plan to place the concentrated article in the barrel and gradually add the required quantity of water, stirring well after each addition. The wash is most effective if applied by means of a spraying machine which can keep up a good pressure. Application by means of a garden syringe is not always satisfactory. Spray fluid made up should be used on the day it is made.

Winter washing with tar-distillates is, in our opinion, best carried out in January, and not later than the second week of February. The work should be done when the weather can be expected to remain dry for at least 24 hours; 48 hours would be even better. Windy weather should be avoided, as such wastes spray fluid and makes application unpleasant for the operator. The number of ideal days in January for winter washing is extremely limited and all preparations for making up the spray fluid should be put in hand before Christmas so that the work can proceed on the first favourable opportunity in January.

We consider that tar-distillates can be safely used on all kinds of hardy fruits during winter where aphis can be expected to appear the following year. Apples, Pears, Plums, and Peaches can be safely sprayed at strengths varying from 5 per cent. Raspberries, Gooseberries, and Currants of all colours have been sprayed by us with no ill effects. It has been stated that some bud damage has been caused to Gooseberries, but after a careful examination last year we failed to find any more dead buds in the sprayed bushes than in the control. If all fruits are sprayed during winter and Aphis controlled, it relieves much spraying work during the summer months. It must be clearly understood that the directions given by each maker should be carefully followed, because the washes vary somewhat, and we are only giving general remarks.

All users of tar-distillates have noticed that Red Spider is not controlled by the wash. In fact, in many cases, this particular pest increases after tar-oil spraying. This is explained by the fact that the wash kills off the natural parasite of Red Spider, but has little effect upon the pest. If Red Spider is troublesome following the use of tar-distillates, a wash containing sulphur, if applied early in the growing season, will control the pest.

Tar-distillate washes can be obtained from a number of the leading specialists in insecticides, and can all be safely and effectively used if the directions of the respective makers are carefully followed.

Carbokrimp, marketed by G. Monro, Ltd., has been shown by many tests, and practical trials by commercial growers, to be absolutely efficient against the winter forms of such pests as Green Fly, Scale, Apple Blossom Weevil, Apple Sucker, and Winter Moth. It also cleanses the trees of Moss, Lichen, etc., thus reducing the breeding places and hibernating quarters of many pests. By killing aphids and caterpillars and general cleaning of the trees, much more luxuriant growth is given, resulting in improved vitality with better and cleaner crops.

Corry's Tar Oil Winter Wash is a similar remedy, and can be recommended for the general destruction of the eggs of pests in all fruit trees during winter. It has also been proved a cure for Big Bud in Black Currants.

Metro Tar Oil Winter Wash, for spraying all kinds of fruit trees, is an emulsion of a specially selected "high boiling" tar oil. The oil used in its preparation is the same as that which has produced such satisfactory results in the trials on dormant fruit trees conducted by the Long Ashton Research Station; trials which proved that this oil possesses a high efficiency in the destruction of insect eggs and, in particular, is most effective against the Capsid Bug.

Solignum, Ltd., makers of the "Agrisol A" Tar-Distillate Wash, issue two useful booklets on the "Agrisol Treatment of Fruit Tree Pests" and the "Agrisol Handbook of Pest Control." These bear testimony to the efficacy of this well-known specific, which is now widely used by home, colonial, and tropical growers. Of special interest is this firm's résumé of the Long Ashton Tar-Distillate Wash Field Experiments, 1929 (reprinted from the Journal of the Ministry of Agriculture, September, 1929). In this pamphlet, which is indispensable to all fruit-growers, is given a concise account of the trials at Long Ashton on Apples, Plums, and Currants. Its recommendations, based on Mr. Tutin's (Long Ashton) formula, are :—

(1). *Apples.*

(*a*) Where trees are infested with Capsid Bugs, the spray at 10 per cent. strength during the dormant season (December, January, or February) should be used.

(*b*) Where Capsid Bugs are absent, the spray at 6 per cent. strength should be used.

(2). *Plums.*

In view of the effectiveness of the Long Ashton spray at 6 per cent. strength against caterpillars and aphis, this strength is advised. The effect of the spray at lower strengths is being investigated.

(3). *Currants.*

Where Capsid Bugs are preser
spray should be used at 10 per
strength. If Capsid Bugs ar
present, 6 per cent. strength sho
used.

It is anticipated that the new "
wash will be available in suitable pa
for garden purposes this season.

REMINDERS FOR THE WEEK

Southern and Midland

Trained fruit trees

It is advisable to remove the surface soil from trees trained to walls every alternate year, as, owing to the exceptional drain upon it, such soil quickly becomes exhausted. Thus, with the pruning finished, this should be carefully removed down to the roots and wheeled to a piece of ground which is being deeply dug, and replaced with a mixture of fresh turfy loam three parts and one part well-decayed manure, the whole being made tolerably firm by treading. If the loam is not of the best a sprinkling of ¼-inch bones should be added. In the case of stone fruits, lime in some form is advisable, preferably freshly slaked.

Pruning

This is now a daily occupation, and must be brought forward when climatic conditions are favourable for such work, as digging and manuring of the plots must also proceed. All prunings must be carefully cleared away to the garden fire, however small, as to dig these into the soil is inviting trouble. If large standard trees have become unduly crowded with wood do not hesitate to remove a limb in order that sunshine and air may penetrate to the fullest extent. Failure to do so usually results in a mass of poor, undersized fruit.

Black Currants

When pruning these, endeavour to keep the bushes filled with vigorous and well-ripened wood by removing as much of the older material as circumstances will allow, and shorten back all remaining growths of the current year. This will encourage strong wood to develop from the base, which, in its turn, will become the principal wood of the bushes. Avoid overcrowding at all costs, as fruit from thinly disposed and well-managed plantations surpasses, both in quality and quantity, anything resulting from overcrowding, either of wood or the bushes themselves. Following the pruning apply a generous dressing of manure, for these are gross feeders.

Christmas Roses

Frames should now be placed over these as a protection from slugs and snow, the lights being drawn off during the day if the weather proves fine and mild. This will have the effect of lengthening the flower-stalks. Where these have not been planted to fit a frame half-barrels or boxes will be found serviceable if a sheet of glass is placed over the top. A few roots may be lifted and potted up to flower in a cool house, where they are usually much appreciated.

Planting Rhododendrons, Azaleas, Heaths

Although naturally lovers of a leafy and peaty soil, free from lime in any form, these beautiful subjects will thrive in almost any soil of a porous nature where lime is absent. The present is an ideal time for such planting, and, providing the ground has been trenched and a little leaf-mould or peat is shaken around the roots of each plant, no anxiety should be felt for their welfare.

Grouping

Where one is able to do so, grouping of varieties should be resorted to, as the effect, when in bloom, is vastly superior to that of haphazard planting. A group of five Rhododendrons, such as Ascot Brilliant or the beautiful Bagshot Ruby, when fully established, is brilliant in effect, whereas five different varieties would look quite commonplace.

Sparaxis pulcherrima, Eremurus, and Torch Lilies

Litter of some kind should be placed around the crowns of these without delay, as they are not capable of passing unharmed through severe weather unprotected. Fire ashes are sometimes used for this purpose. The same applies to Romneyas, which should be shortened back somewhat before burying their crowns in fire ashes.

Pergolas and arbours

The pruning of the many varieties of climbing plants furnishing these structures should now be taken in hand. A light, airy covering only should be the object in view, so as to enable sunshine and air to penetrate at intervals. Roses must be well thinned, Vines pruned rather severely, and other climbers according to their constitution; even Wistarias must be thinned at times.

Cold frames containing salading plants

These must be frequently examined for leaves which tend to damp and slugs, both of which should be cleared away, the soil between the plants stirred up, and a light dusting of soot and lime given between the plants. Admit air freely on favourable occasions.

Zonal Pelargoniums and Primula malacoides

Those which have been prepared for winter blooming should now be assisted with diluted manure-water as their flower-spikes develop. A night temperature of from 50 degs. to 55 degs. will be found suitable at the present time.

E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Tuberous-rooted Begonias

The ripening stage is now over, so the bulbs should be shaken clear of the soil and laid out in shallow boxes for a few days to make certain they are dry. If the boxes are set on a sunny shelf or stage they will soon be ready for storing away for the winter. Before storing, it is a good plan gently to rub off all the old roots, as this saves much trouble in spring. Place the bulbs hollow side down in strong boxes, using plenty of perfectly dry sand between the layers. Set the boxes in a dry, frost-proof place, but not in a high temperature.

Chrysanthemums

As the plants go out of flower cut down the stems to within about 6 inches of the soil and set them in a light position so as to induce the production of sturdy, firm cuttings. Some varieties that are very
throwing up cuttings should be knock
of their pots and have the bulk of t
removed from the roots. They shoul
be placed in 6-inch or 7-inch pots,
some fresh, light compost, which shou
be made very firm. Syringe overhea
and in most cases quite a number
tings will be forthcoming.

Treatment of the cuttings

Nice sturdy suckers some 3 inc
4 inches long make the best cuttings.
should be inserted around the edges of
pots filled with sweet, sandy compost
is for decorative varieties, but if for
ing for large blooms one cutting to a
pot is preferable. While the cutting
root somewhat faster if set in a clos
there are often so many lost from da
off that I have abandoned that metho
instead, set the pots of cuttings in s
boxes with a layer of leaf-mould
bottoms. These are then set on the s
a cool greenhouse. Not 5 per cent. a
lost by damping, and the resulting
are dwarfer and sturdier.

Spiræas as pot plants

These easily-grown subjects are ver
ful in the conservatory, and also mak
decorative room plants. Decent-sized
should now be potted up and set in
frame. A few weeks hence they
introduced to a little warmth. Hard
and dryness, however, either at the r
in the atmosphere, must be very ca
guarded against. Introduce just
plants at a time into warmth.

Dicentra spectabilis

This old-fashioned hardy plant i
beautiful when grown in pots for co
tory adornment. Some strong
should now be potted up, an 8-inch po
a very suitable receptacle. While th
be introduced to slight warmth right
better results are had by placing the
roots in a cold frame for a week or tw
they are potted up.

Watering in winter

The giving of water to pot plants ha
very sparing during the next few wee
more of these are killed by too much
than by too little. The majority of pot
are at rest during the winter, so na
require but little moisture to maintain
in health, while evaporation is also
minimum. To be daily pouring water
the soil is thus most harmful, besides
utterly unnecessary. Most Ferns a
" hard-wood " plants should never b
mitted to get really dry at the roots,
keep them constantly saturated is ever
harmful. Give water, therefore, wh
soil is beginning to show signs of d
and then no more until there are again
of a recurrence of this condition.

The vineries

As the period of rest is ushered in

The Derby Chrysanthemum Show

CHRYSANTHEMUM SHOWS

eby Chrysanthemum Show

H twenty-second Chrysanthemum Show d at Derby recently for three days er the auspices of the Derbyshire ltural Association, was undoubtedly a sp forward in the Chrysanthemum nt in the Midland Counties this year. 50 entries from 75 Exhibitors so il taxed accommodation in the Royal all that the glass-covered annexe had quisitioned.

rs. Mansell and Hatcher, of Rawdon, ire, staged 200 sq. feet with Orchids, g Cattleyas, Odontoglossums, s, Cypripediums, a specimen of the in- g Bulbophyllum Lobbii var. Siamensis e oscillating lip, and attracted to ves unceasing praise and wonder- . They were awarded a large Gold

he other end of the hall, Messrs. and Sons, Royal Seedsmen, Reading, 120 dishes of vegetables, on tabling 30 g and 6 feet wide, comprising fine ns of Capsicums, Celery, Leeks, Po- Onions, Yellow and Red Tomatoes, Corn, Ornamental Gourds, and dishes varieties of vegetables in general com- for which they were also awarded a edal.

centre of the hall was occupied by a aneous group of exotic plants, 100 et, including Pandanus Veitchii, ms, Nandina domestica, Eulalias, s, winter-flowering Begonias, Gloire de e, and Optima, surmounted by a large , and for this Mrs. Walter Evans, Abbey (gardener, Mr. J. Maxfield), was d the Silver Cup presented by Mr. H. , Chairman.

was accompanied by two groups sent A. Leslie Wright (a Vice-President), of y Hall (gardener, Mr. J. Cartledge), included Alocasia Lowii, Grevillea , Eulalias, Dracænas, Nephrolepis ides, and Adiantums, as well as many varieties of Chrysanthemums, and the same gentleman also decorated the platform with Kentia Palms, Liliums, and Chrysanthemums, and to this also a Gold Medal was awarded.

Other trade exhibits included Messrs. H. Woolman, of Birmingham, and Messrs. Dickson and Robinson, of Manchester, with Japanese and decorative Chrysanthemums; Messrs. Allwood Bros., of Haywards Heath, Sussex, Perpetual Carnations; C. Gregory, Chilwell, fruit and shrubs; Messrs. William Lowe and Son, Beeston, Notts., shrubs and Alpines; Messrs. Dickinson's Shardlow Nurseries, 20 feet display of Grapes, Tomatoes, and Cucumbers.

The Captain Drury-Lowe Silver Cup for 24 Japanese Chrysanthemums attracted 5 entries, and was won by Captain R. B. Brassey, Cottes Brook Hall, Northampton (gardener, Mr. J. G. Quinn); second, Mr. W. E. Ann, Darley Field (gardener, Mr. L. Dutton); third, Mrs. Walter Evans, Darley Abbey.

The President's Cup, presented by Mr. J. A. Aiton, of Duffield Park, also went to Captain R. B. Brassey; second, Mr. H. H. Tomlinson, Derby; third, Mrs. Walter Evans.

The G. H. Strutt Silver Cup for display of Single Chrysanthemums, 9 feet by 3 feet, was awarded to Mr. W. E. Ann; second, Mrs. G. H. Strutt, Belper (gardener, Mr. J. Middup); third, Mrs. Walter Evans; fourth, Mr. J. A. Aiton (gardener, Mr. J. H. Thomas).

In the members' classes, Mr. H. H. Tomlinson, Derby, won the C. W. Catt Cup with 12 Japanese blooms arranged for effect.

The Association's Silver Challenge Shield for 12 dishes British grown hardy fruit went to Mrs. Walter Evans, Darley Abbey.

Silver Cup presented by Mrs. Bourne Wheeler was won by Mrs. Walter Evans, Darley Abbey.

Silver Cup for semi-circular group of Chrysanthemums, 5 feet by 4½ feet (plants only).—First, Mr. C. S. Buck; second, Mr. A. Moore, Alvaston; third, Mr. J. Potter, Derby.

W. E. Watt Silver Cup, artisan members, for six Japanese blooms, was won by Mr. F. Meakin, late Secretary, Derby.

The new provincial class provided by the National Chrysanthemum Society for 12 Japanese blooms, distinct varieties, first and Silver Medal, Captain R. B. Brassey, Northampton; second and Bronze Medal, Mr. H. H. Tomlinson, Derby.

The premier bloom in the open classes carrying the N.C.S. certificate went to Captain R. B. Brassey, Northampton, for a fine specimen of Majestic, while in the artisan members' classes, Mr. F. Meakin was successful with a Mrs. Gilbert Drabble.

Over 12,000 people paid for admission to the Show, and the Derby Education Committee ran special cars for the school children, about 1,000 of whom evinced an interest that was pleasing to behold.

Norfolk and Norwich Centenary Chrysanthemum Show

This event took place on November 21st, 22nd, and 23rd in the old-world St. Andrew's Hall, Norwich. It is reputed that the first Chrysanthemum Show in England was held at Norwich, but annals prove that it is 100 years ago since the Norfolk and Norwich Horticultural Society held its first show, hence in this, its centenary year, the Society made efforts to make this year an outstanding one, and right well did they succeed. A delegation came from the National Society, and made local awards independently of the liberal schedule provided locally.

There were four entries in the class for 36 blooms on the usual show board. Surely the Society will see that the standard board deserves to be increased in dimensions; as it is now, with the huge blooms, there is such an overlapping of petals that the outline of the flowers is not seen to perfection

The classes for three blooms with long

stems in each vase, whether for twelve or six varieties, are always more presentable, and one was pleased to see so many entrants in these classes.

Those designated as "singles" have a large following, and in each class we found these had to be in vases and not in cups on boards.

It was a surprise for Mr. C. Dean, gardener to Major Bruce, Brooke Hall, when he saw the N.C.S. medal card upon his twelve varieties exhibit.

The artistic side of the gardener or his lady was splendidly portrayed in the classes for vases or baskets of Chrysanthemums and other foliage.

Pot plants were represented by Cyclamen (the best from Mr. W. Barrie, gardener to Colonel H. Barclay), Begonias, Primulas of four types, and Zonal Pelargoniums. There were miscellaneous cut flowers, and a fine array of cut sprays of berried shrubs.

The Fruit Section was what one locally terms an "eye-opener." The colouration of the Apples was equal, if not superior, to those we have from our best colonial exporters. One could never wish for more colour on Apples than Mr. S. High (gardener to Mr. J. A. Christie, M.P.) had on his dish of Cavills Rouge Precose.

We had always been used to seeing extra good grapes, especially Muscats, from Gunton Park Gardens in the days of the late Wm. Allan, and it seems that by following somewhat in his predecessor's footsteps Mr. A. J. Jones, the present gardener, can produce Grapes equally as good. Mr. Jones also takes up Pear culture in the same way. Wonderful fruits. Worthy of special mention was the extraordinary dish of Pears Emile d'Heyst staged by Mr. S. High (Mr. Christie's gardener); everyone who knew anything about Pears pondered over them and asked how he had got such fruits.

Mr. A. Bentley (gardener to Mrs. Barker-Hahlo, Langley Park) scored two signal successes, one by winning first for nine distinct dishes of dessert Apples, and the other by winning first for a collection of 12 kinds of vegetables.

The trade had made an instructive educational exhibit, special mention in this section being due to Messrs. Daniels Bros., Ltd.; Bakers, Wolverhampton; Allwood Bros., Clibrans, and A. Reeves and Co.

In connection with this Show, the Norfolk Commercial Fruit Growers' Association had Blackfriars Hall placed at their disposal for an exhibition of Apples, cooking and dessert, in barrels, sieves, and boxes as packed for market. Here one saw not only quantity, but quality, and fine examples of grading and packing. The County Council Experimental Fruit Station, Burlingham, Norfolk, which is under the supervision of Mr. H. Goude, had also a most attractive and educational exhibit of choice Apples and Pears grown at the station. AYTCH PEA.

Autumn and the root crops

The considerable spell of comparatively mild, growing weather which we have had recently has been welcomed in all parts of the country, but more particularly in those areas devastated by the long drought. The rain came too late to restore full vigour to root crops, but many have been surprised by the new lease of life given to mildewed crops. New leaves have been thrust out, and roots have swollen considerably in the last few weeks. If hard weather does not set in, appreciable growth will be made by Christmas, and, in this connection, it may be worth while considering a practice common in the north of ridging up root crops by a light covering of soil so that they are protected from frost and are enabled to continue growing during any mild spell that may come along in course of the winter. As it is at present, the yield of Turnips and Swedes is expected to be about 11½ tons per acre or 1 ton below the average for the last ten years. Potatoes, th
the small side, are free from disease
yield of about 6½ tons and a total
3,350,000 tons, or a quarter-million a
ten years' average.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish pl
be named should send fair examples of ea
stem, leaf, flower, or fruit. (Snippets of
and points of shoots are useless.) Not mo
four plants should be sent in any one week
same correspondent. Where more than o
is sent they should be numbered. Of conif
cones should always be sent.*

Naming fruit—*Several specimens in d
stages of colour and size of the same kind
assist in its determination. Single, unr
deformed specimens are difficult to nam
do not undertake to name more than
varieties at one time.*

FRUIT

Brown Rot of Apple

(J. A., Batley).—The specimen Apple sent is affected with Brown Rot, a fungus which in turn attacks flowers, wood, and fruit of Apples and allied plants. When pruning, cut out and burn all diseased wood and fruits, especially those fruits which remain attached to, or lie beneath, the trees. Continue the use of your tar-distillate wash (see special article, page 809), and, if possible, defer its use until the last week in January. Give the trees a dressing of sulphate of potash at the rate of 1½ ozs. per square yard. Dress the soil at least a yard on all sides wider than the spread of branch. The only control of much use for Brown Rot is destruction of diseased material by fire. Potash always helps a tree to resist disease.

Pear in flower in November

(R. T. J.).—It is unusual for a tree to be full of flower so late in the season. We think that it has been caused entirely by the transplanting last autumn. The root system was not in condition to support the
flowers produced in spring, and frui
to develop. The tree has probably
weakened that its balance has been
hence the second crop of flowers
should be inclined to thin the spur
considerably and top-dress the tree
good layer of well-rotted farmyard m
An equal mixture of basic slag and
applied at the rate of 8 ozs. per squa
might help the tree to set its fruit.

Diseased Pears

(H. H. Newbury).—Your Pears are
with Pear Scab. Please see reply to
Jobson on page 796 of our issue for No
23rd. Your specimens have shrivelled
what. Late Pears should be allowed t
as long as is practical.

Apple Scab

An error has crept into our reply t
Warren on page 796 of our issue for
ber 23rd. The first line should read-
Apples are affected with Apple Scab (n
Scab as stated). Note.—Apple and

caused by two different fungi. The ausing Apple Scab cannot attack the reverse is also true. The con- oth fungi is similar.

ROSE GARDEN

n and transplanting two Rose res

. C.).—Both may be pruned with the present time, and this will prove to the plants, especially as you wish hem. Zepherin Drouhin.—Spur in all d healthy side shoots to within two eyes of their base and shorten back sound wood growths of the current inging from the base, removing r green, unripened shoots. Hia- -Remove all weak growth, both nd old, preserving from eight to healthy, well-ripened growths, the hich should be removed so that those do not exceed 5 feet or 6 feet in

ildew

Davis).—A fairly strong solution of hur is used during the winter as a ash for Rose trees; the strength is 1 in 20 gallons of water. The ength spray is also used in late if mildew has been troublesome. so late in the season any damage curs to the foliage is not a serious . All prunings should be removed and n spring, and you should keep the sted with a good sulphur dusting at intervals throughout next season. bject to the unsightly appearance of ler you might try spraying with am- polysulphide wash. This spray does the foliage to any great extent.

CHRYSANTHEMUMS

athemum Mildew

E. I. Cox).—The mildew which at- rysanthemums is entirely different which attacks Roses. If the mildew plants is not too bad, dusting the ith a good sulphur dusting powder e sufficient to control the disease. circulating in your house, and do e the surroundings damper than you . It is difficult to keep mildew out ted houses at this time of the year. rieties of Chrysanthemums are more the disease than others.

athemums leggy

set Duffer").—The fact of your your plants in a shady place is part of of their growing so "leggy," while feeding does the rest. Cuttings may ed from the middle of December till of February, and when roots are ot off singly into 3½-inch or 4-inch arly in March move to a cold frame, en the plants are 4 inches high, nip s out of each. When these pots are d with roots, give a shift into the e, making the soil very firm. Return ame, but give abundance of air and possible on fine days, drawing the ght back. Early in June move into ring pots, those 8 inches or 9 inches ter being best. Use a compost of rfy loam, two parts; half rotted ne part; old mortar rubbish, one- of a part; coarse sand, half a part. may be added, with great advantage, potful of bone-meal and a 5-inch of Thomson's Vine, Plant, and e Manure to each barrow-load ther ingredients. Mix thoroughly, it well into the pots. The plants really be set in an open, sunny and, to prevent damage by the wind, d tie securely. It may be necessary to pinch the points out of all the shoots about 10 days before the final potting. If you use the compost advised above you will hardly require to apply any further feeding until the buds show, when a short course of clear soot water twice a week, and a tablespoonful of Ichthemic Guano in a gallon of water also twice a week, but on different weeks from the soot water. Alternate weeks with these two stimulants will give good results, both being stopped immediately the buds begin to show colour, clear water only being given henceforth. If you follow these instructions closely, good results are almost certain.

FLOWER GARDEN

Lilies in the first year

In Gardening Illustrated of November 16th, page 769, there is an article on "Autumn Flowers," by Edward H. Woodall. At the end of the article he makes a remark about Lilium auratum bulbs, which are sent from Japan with all the roots cut off. According to what he says, the flower-buds must be cut off the first year or the bulb dies of exhaustion. I should like to know if the same applies to imported bulbs grown in pots and allowed to flower the first year. How should they be treated after flowering the first year successfully? I have some Lilium candidum bulbs from Cambridgeshire, and find they have sprouted about 6 inches; also those in the friend's garden in Cambs. Should they be protected during the winter?

"Newark, Renfrewshire."

[It is undoubtedly an aid in the establishing of imported bulbs of Lilium auratum if buds are removed the first season after transplanting; and while this practice does not carry a guarantee of success, plants so treated are more likely to establish themselves than those allowed to flower the first year. The best method is to pot up imported bulbs immediately on receipt and plunge in a bed of sand or ashes, where they can be left for the first season. Remove buds immediately they appear, and so encourage formation of roots at the base. Transplant to permanent quarters when stem dies down, or in the spring, whichever is most convenient, taking care not to disturb the roots. Plant at least 9 inches in sandy loam and leaf-mould. Sharp drainage is even more important than compost. Lilium auratum grown in pots under glass are not often satisfactory for future display, although if deep pots are used and bulbs are grown cool (not forced) a number may be found suitable for repotting. After flowering allow stems to die down, removing when they part company with bulbs with little or no effort. Repot and plunge in a bed of sand or ashes until a top growth of 4 inches to 6 inches is made, then transfer to cool house. If it is your intention to remove buds from plants for ultimate greenhouse or conservatory display there is no occasion to transfer from plunge bed the first season. The removal of buds from plants intended for pot culture should bring about more lasting qualities, which may make it worth while potting the same bulbs annually. On the other hand, with bulbs at the reasonable price offered to-day is it worth while sacrificing the flowers the first year? Lilium candidum is nearly evergreen, for immediately it has finished flowering new leaves appear. It is quite right and proper for this species to show a certain amount of foliage at the present time. It is perfectly hardy and needs no protection whatsoever.]

Arenaria montana overgrown

(H. B. C.).—The best time to reduce this lovely plant is immediately it finishes blooming, and you would probably be well advised to leave it alone until it has again flowered. But if you must reduce it now on account of its crowding over other smaller plants you may safely do so by lifting the outer growth and cutting from underneath. If this is carefully done the plant will drop back naturally into its place and show no sign of disfigurement.

Diseased Violets

(Perplexed, Wicklow).—Your Violets are suffering from a severe attack of Red Spider, which should have been controlled when it first appeared, and not allowed to develop to its present state. We are doubtful if you can save your plants now. You might try the insecticide called Volck. Your seedsman should be able to supply you. If not, write direct to Messrs. Geo. Monro, Ltd., Covent Garden, London, for details and the nearest source of supply.

Cyananthus wanted

Where can I obtain the Cyananthus referred to on page 738, Gardening Illustrated, November 2nd issue?

M. Neilson.

[Cyananthus Delavayi is offered by R. Wallace and Co., Ltd., The Old Gardens, Tunbridge Wells; C. incanus by Messrs. Ingwersen, Birch Farm, Sharpthorne, East Grinstead, Sussex; C. lobatus (Cooper's Variety) by Mr. John Stormonth, Kirkbride, Cumberland. We have been unable to locate the remainder, which are probably in the hands of a few private establishments only, being not only scarce, but very little known.]

GREENHOUSE

Pruning Bougainvillea

Kindly tell me how to prune a Bougainvillea (Mrs. Butt). It is on a south wall in greenhouse, and has six strong leading shoots, 10 feet long. No side growth. Should these be cut back, and how should future laterals be treated?

Wimborne.

[Cut back to 4 feet or 5 feet during December. This will induce the production of side shoots next year, and next winter all of these should be well spurred in, unless you require more stems for covering the wall, in which case train in those suitably placed for your purpose, merely shortening them back to about half their length. Annual spurring in during winter is the subsequent treatment necessary.]

TREES AND SHRUBS

Time to cut back hybrid Rhododendrons

(H. B. C.).—The second week in April is the best time for this, although providing you do not place any special value upon the flowers you could with perfect safety cut them back at any time previous to April. If, however, you prefer them to bloom first, then the plants must be cut back immediately the flowers are over, side shoots being quickly formed and sore places soon obscured by fresh young growths, some of which produce blooms the following year.

Dying Holly

(J. Whitworth Jones).—We have carefully examined the Holly specimens and there is no trace of a fungus or insect which could cause the trouble. Without examination of the tree *in situ*, we cannot be of much assistance. The probable cause of the trouble is root failure. Take a spade and bare the growth down to the point of union with the old root stock; if this is above ground bare the old root stock and see if you can find traces of decay. It occurs to us that the old stock may be slowly rotting away and gradually the young growths die out. If this is so, notching the young wood and earthing it up with some sharp, sandy material might induce root formation, in which case the young growths would be independent of the old root system.

Vitis Coignetiæ fruit for wine making

(Mrs. E. Buckton).—We have never actually made use of the fruit of this Vine for wine making, but have been informed that excellent wine has been made from it. As practically all the true Vines produce desirable fruit for this purpose, we see no reason why the beautiful V. Coignetiæ should not be used in the same way. Perhaps some of our readers have put it to the test?

MISCELLANEOUS

Mealy Bug

(Mealy Bug).—Both sodium and calcium cyanide are used as a control for Mealy Bug on Vines. Write to any of the insecticide firms advertising in our pages for details as to use. We are inclined to think that calcium cyanide is the safer article. If you consult back numbers of Gardening Illustrated you will find calcium cyanide advertised.

Plague of sparrows

(Worried).—One method of keeping down a plague of sparrows will be to trap the birds in one way or another. There are several good sparrow traps on the market, and you could obtain details of such from your horticultural sundriesman. In the breeding season much can be done by reducing the number of eggs laid. Sparrows only become a pest when they are too numerous.

Bone meal

(L. T.).—Bone meal is a slow-acting manure; as to how slow it is depends upon the fineness of grinding, *i.e.*, a coarse sample is slow-acting compared with a more finely ground sample. It is not usual to use bone meal in a soil mixture for plants which are only to occupy pots for a very short period, unless the soil is to be used for some other purpose after. Pot fruit and plants of a more permanent character are frequently top-dressed with a mixture containing bone meal. It should be remembered that although bone meal is insoluble in pure water, it is readily soluble in weak acids such as are formed in soil water. If bone meal is thoroughly mixed with a soil it is not so slow-acting as we are sometimes led to believe. Thorough mixing with the soil is the secret of success with bone meal.

Bone manures

Is bone flour as good a general fertiliser as bone meal? I find I can buy bone flour very cheaply, and as my pocket is unfortunately not a long one—and my garden is —this is a great consideration.

Betty Sibley.

[The term general fertiliser is used for a manure which contains the three plant foods applied to the soil, viz., nitrogen, phosphorus, potassium. Further, the term general fertiliser should only cover a manure when these plant foods are in the correct proportion for growth. Bone meal and bone flour cannot be included under the term because they only contain nitrogen and phosphorus, and have more of the latter than the former. All bone manures are mainly phosphatic in character. The difference in bone meal and steamed bone flour is that the bone meal is merely waste bones ground up into powder. This material contains a lot of cartilage containing nitrogen, but it is somewhat slow to decay. Steamed bone flour has been subjected to steam at a pressure which extracts much of the cartilage matter, so that the resulting product is more easily soluble, but contains less nitrogen. The cartilage extraction is used for making glue. According to the return sent out by the Ministry of Agriculture for November the price of bone meal at London in two ton lots, f.o.r., containing 3¾ per cent. nitrogen, plus 20½ per cent. phosphoric acid, was, on an average, £8 per ton. Steamed bone flour, containing ¾ per cent. nitrogen and 27½ per cent. to 29¾ per cent. phosphoric acid, was £5 2s. per ton. On unit value, the steamed bone flour is much the better value at this price. You will, of course, appreciate that the value of any manure depends entirely upon the percentage of plant food it contains. The higher percentage of nitrogen makes the bone meal more expensive. We hope to deal with unit value of manures in more detail in a future issue.]

NAMES OF PLANTS

R. E. Nicholls.—1, Potentilla alchimella; 2, P. alba; 3, Polypodium vulgare; 4, Hieracium, flowers are necessary to decide which variety; 5, Nepeta; 6, Veronica buxifolia.

"*School,*" *F. D.*—Pink flower, Nerine Bowdeni; yellow, Chrysopsis villosus Rutteri.

D. Page Roberts.—1, Berberis polyantha; 2, Cotoneaster Simonsii; 3, Berberis subcauliata; 4, B. aggregata; 5, Cotoneaster applanata.

G.—1, Ayrshire, or Mountain Viola; 2, Bambusa angustifolia; 3, Miscanthus japonicus zebrinus.

G.—1, Teucrium chamædrys; 2, Pentstemon Newbury Gem; 3, Antennaria Margueritacea; 4, Eryngium planum.

NAMES OF FRUITS

R. B. Cannon.—Crab Apple Cheal's Crimson.

A. P., Herts.—1, King of the Pippins; 2, Lady Henniker; 3, Golden Noble; 4, Rosemary Russet; 5, Cox's Pomona; 6, Winter Greening.

NEWS IN ADVERTISEMENTS

David Green and Son, 993, Albert Street, Lytham, have issued a new price list of "Forward" greenhouse heating apparatus. This list also gives details of prices for pipes, joints, and connections. Their complete list of bargains is a very comprehensive one, and includes a big range of house and garden sundries.

The label problem

The question of the best method of labelling has always been a vexed one. The cheap and convenient old-fashioned wooden label has been popular for years, but there are obvious disadvantages with this. These drawbacks are overcome by a very excellent 12-inch zinc and galvanised steel holder made by T. N. Waldron, Ltd., Avon Works, Stratford-on-Avon. The wooden label is slipped in and thus becomes indestructible. It cannot rot or be cut with the hoe, and the label is clearly visible. The holder can be used year after year. It is an excellent little accessory, and sold at a very reasonable price.

Fremontia californica

This handsome shrub (see illustration, page 800) must have the protection of a south or south-west wall, and even then it will be wise to protect it from severe winter weather. I have known some very fine specimens so grown, but scarcely equal to others grown in a cold house where, on a back wall, they were particularly vigorous and floriferous. The greyish-green leaves are reminiscent of those of the Mallow, and the great honey-yellow, wax-like, cupped blossoms are produced from June to October. In some situations this Fremontia will display a tendency to elongated growth, and it is an excellent plan to remove the growing
points if a well-furnished and free-b
plant is desired. The young shoots
Malvaceous plant are covered with
brown tomentum, and the leaves are
on their undersides. Cuttings root rea
seeds will also afford a ready mean
crease. F. californica was introduc
California in 1851, and like so man
from the favoured western seaboard
America, it is apt to resent our in
winters. It will, therefore, be
maintain a young plant or two in a
cold house to replace possible casualti

The R.H.S. Gardeners' Diary

This is a useful pocket diary, well-
to horticulturists throughout the coun
is sent out under the auspices of the
who are joint publishers with Charle
and Co. The diary for 1930 is no
lished.

Winter colour

gl of colour in the garden in mid-
er quite easily achieved, though it will
o course, be as brilliant as mid-
nes display.
vo have water in your garden, some
m r pond, you can have sheets of the
gl of Cornus alba, or of the gold of
vellina (the Golden Willow). Both
es shrubs are grown for the winter
y their coloured stems, and both re-
entical treatment. Cut them down
ery spring in order to produce plenty
ur shoots for the succeeding winter's
y. They are best planted in as large
s possible, allowing about 4 feet be-
ch plant. A very lovely effect can
d by underplanting the group with
r Aconite, which will encrust the
d with gold dust in the early days of
a and thoroughly enjoy the situation.
sheltered garden Rhododendron
icn never fails to please from
onwards, with its masses of trans-
violet flowers of an indescribable
at lights up the whole bush. It is a
evergreen, about 4 feet high, a
eafy and peaty soils like all Rhodo-
on, and truly it is a "thing of
y and a source of great joy to its
ssessor, but, unfortunately, it is not
gden that can give it the conditions
o—shelter from harsh winds and a
re soil.
little-known evergreen treasure from
Cryptomeria japonica elegans. In
r me its tapering spire of foliage turns
ades of rose and bronze, billowy and
t warm and distinct in colour; a very
r addition to the "evergreens," not
een at all. In a small garden its dwarf form is just as beautifully coloured in winter, and is very attractive, too, in its rounded tuffet of soft coppery-rose.

In districts where Heathers and Heaths do well, excellent effects may be had by the use of winter-flowering Heathers when these are planted in large enough groups. Heathers are, by nature, gregarious creatures, and are happiest when jostling in a crowd of their fellows, and it is when they are boldly massed together that they give the best results. Erica carnea, in all its many varieties, is the outstanding winter-flowering Heather. Winter Beauty is a rather pale but exceedingly good kind, very like King George. Queen Mary is a darker shade, and Queen of Spain darker still. Præcox is the earliest and Thomas Kingscot one of the latest to flower. Heathers of all sorts are becoming increasingly fashionable, and, in the hands of a bold planter, are among our most useful plants.

L. STOKES.

Howth, Co. Dublin.

LATE NOTE

John Cypher Memorial Fund

Since the publication of the previous list of contributors to the John Cypher Memorial Fund, the following amounts have been received and acknowledged:—Mr. Edgar Ingham, Saville Heath, Halifax, £1; Mr. E. Clematis

The long, loose growths of those supported by tripods or open fences should now be shortened back to prevent the rough winds buffeting them to and fro, and damaging their basal growth. In some instances the plants may be pruned entirely, in others it will be advisable to leave them to be dealt with at the turn of the year.

A POSTCARD
will bring you a free copy of
DISCOVERY

the magazine which presents modern knowledge with a popular appeal. This is an age of discovery, of progression in all phases of science. Are you keeping in touch with developments, or does your newspaper nowadays contain items which convey little to you?

Does Einstein's new theory mean anything more than a newspaper headline?

Do you know that a moon rocket is now actually undergoing construction in Germany?

Is the great advance in the science of food values and dietetics known to you only by the one word "vitamins"?

On these and many other subjects **DISCOVERY** can keep you informed. Its contributors are experts, but experts who can impart their knowledge in non-technical language.

They make their subjects live and invest them with an enthusiasm which the reader shares. The journal is printed on art paper, so that its many illustrations are reproduced with admirable effect.

DISCOVERY is educative without being dull.
DISCOVERY is modern and yet authoritative.
DISCOVERY is distinctive and always up-to-date.

KELWAY'S PÆONIES.
NOW IS THE TIME TO PLANT
KELWAY'S LOVELY SWEET-SCENTED ENGLISH PÆONIES.

Autumn and early Winter are the best seasons for Pæony planting. The Pæony is probably the hardiest of all garden plants. In Canada it flowers in perfection after 80 degrees of winter frost. Send at once for fully descriptive illustrated Catalogue of the most up-to-date collection in the world.

Plant now so as to get flowers sooner.

Collections of named varieties, the selection of sorts left to Kelway & Son, from B 18s. per dozen to F 100s. per dozen. Collection C, double and single flowered fragrant varieties—white, cream, blush, peach, rose, amethyst, cherry red, crimson—strong plants guaranteed true to name, 24s. per dozen, 50 for 90s.

KELWAY COLOUR BORDERS
OF HARDY PERENNIALS
should now be planted.

They are labour saving and permanent adornments of the garden, and a never-failing source of interest to the household and visitors, as well as providing cut flowers. Colour Borders are "our own invention," and every one we design is different. Please send us a small sketch of your garden with dimensions, soil, and aspect, and we will quote at once.

—— —— Crescent,
Kirkcaldy,
7th October, 1929.

"The plants for the Kelway Colour Border arrived all right and beautifully packed.

"My gardener, who was for many years with a big English commercial gardening firm, was astonished at the size of the plants, as he expected that 'yearlings' would be sent."

THE CHRISTMAS PRESENT PROBLEM.

6, 12 or 24 good Pæony roots, nicely packed and sent free, with card enclosed, make an Ideal Present for gardening friends at Christmas or the New Year, the planting season. Merely mention the total sum; we do the rest.

Some Second Thoughts on Pears

By E. A. Bunyard, F.L.S.

rdener's mind is schooled by time perience to measured judgments, exercises a wise deliberation as king up a new variety as in dis- old one. In fruit the need for such patent. The flower, appealing to erhaps the nose, tells its secrets at eeting, but the fruit not only re- ing, but testing in our own special Even then a series of years must we give our final judgment so that season and the cool may mark their fects.

c thoughts are, e best, and the sy condemnations l an amusing op- ut not a good

wo summers of armth, it is well one's opinions of ites and even to those discarded ch were formerly e unworthy. e chastening re- re aroused by a Conference Pears sert table. often been amic- ached for placing a value upon this hich is now so own for market and is, therefore, y the impetuous able. I am, how- pentant and even l have previously d its merits. The his season have a xcellent texture, ery, and melting, ng the ideal of Comice, in this The flavour is good, almost very l although not in the first dozen ainly to be placed in the second. consider, too, its admirable garden fertility, and compactness of ts natural desire to make fruiting must think seriously before we nto the ranks of the second rate.

Pear which requires consideration de Paris, an old variety, tried in and condemned, but, I think, This fruit is one of the great Van sing and at his death in 1842 passed hands of M. Bivort, who carried on is work. Van Mons did not live to see the fruit, but in 1847 it first fruited and was introduced by M. Bivort and soon made its way to England. Its career was apparently soon cut short by the fiat of Mr. Blackmore, who considered it "very poor" at Twickenham. Dr. Hogg thought but little better of it. "Flesh yellowish, rather gritty, juicy, brisk, and sweet, with an aromatic flavour." This is not too severe, apart from the grit, but when he finally sums up "a good Pear, of ordinary quality," we are left wondering what his real opinion was.

Having so often seen this variety in Continental gardens, I thought it should be tried again, and I think it is worth consideration, even by those who desire something more than a "good, ordinary" Pear. I am strengthened in my opinion by that of Mr. Barnett, of Tilehurst, a judge of no mean capacity, who would place it in his first dozen Pears. It may, of course, like many other Pears, be a little captious as to soil, but with me it grows so well and crops so freely that I do not regret an attempt to re-introduce it into British gardens. No Pear has a better habit, short, well-spurred growth seems to be its constant aim, and, on the Quince stock, it makes an admirable pyramid or cordon.

Another Pear which, this year, has far exceeded its average quality with me is Colmar d'Ete, another seedling of Van Mons'. As Dr. Hogg rightly says, "in warm seasons the flesh is melting . . . the juice of honey sweetness, rich flavour, and a noyeau aroma." I have, I fear, rather underrated this most fertile and facile of Pears, and, in place of the toleration previously given, a warm admiration must follow a genial summer.

Edward Bunyard.

Pear Beurre Alexandre Lucas

One of the best varieties in season October till December

Pear Beurre Alexandre Lucas

This is a little known but valuable variety, and although, from a quality standpoint, it may not equal Doyenne du Comice, Thompson's, and Beurré Superfin, it should certainly be included in any selection of the best 12 Pears. I have always found it a consistent and heavy cropper as a cordon, and with a little care as to ripening it can be had in good condition from the middle of October to the end of December. This variety was strongly recommended to me as a cordon. The mistake often made in planting cordons, however, is that too many varieties are put in, or, if not this, too many of one season. A short list that I have found kindly growers, prolific, and of good quality, includes Clapp's Favourite, Beurré d'Amanlis, Buerré Hardy, Buerré Superfin, Buerré Alexandre Lucas, Louis Bonne, Doyenne du Comice, Thompson's, Glou Morceau, Nouvelle Fulvie, and Josephine de Malines. My soil being on the light side, a little extra preparation was necessary when the trees were being planted. To the top spit were added some heavier soil and a little cow-manure. When the fruit was swelling a mulch of cow-manure was given, the value of this being apparent in the fruits that were borne.

C. P.

Thompson's Pear

An exquisite fruit, worthy to rank with Doyenne du Comice, perhaps the finest of all

Pears, and yet Thompson's exquisite variety is not nearly so well-known as it so well deserves to be. Ripening in November, the medium-sized fruits are obovate, the pale yellow skin displaying a generous array of pale cinnamon-coloured dots with occasional larger areas of russet; the eye is open and set in a shallow basin, the white flesh is very juicy, of exceedingly rich flavour, and possessing a fine aroma. Although perhaps not a great bearer, I have rarely known Thompson's to fail when grown as a wall tree. It succeeds best on the Pear stock, and is frequently very satisfactory as a standard.

This exquisite fruit was raised by Van Mons sometime prior to 1820, and dedicated to Robert Thompson, the fruit superintendent of the R.H.S., and one of the greatest, if not the greatest, of British pomologists.

RALPH E. ARNOLD.

Some good Crab Apples

Crab Apples are among the most ornamental trees in the spring and in the autumn when laden with beautifully coloured fruit. They are ideal for a small or large lawn, and the fruits, when ripe, are valuable for making jelly and for other culinary purposes. Veitch's Scarlet I consider the best. It resulted from a cross between the Red Siberian Crab and King of Pippin Apple, and has a decided flavour of the latter. The fruits are of a fair size, a beautiful crimson-scarlet colour, and the tree bears freely. John Downie is a very attractive variety, a certain bearer, and one that succeeds in most soils. The fruits are oval, of a beautiful golden-yellow, tinted scarlet, and one of the very best for making jelly. Mrs. John Seton, another excellent variety, is a cross between Transcendent and King of the Pippins. The fruits are very large for a Crab, being quite 2 inches in length, and almost as much in thickness. They are light yellow in colour, spotted, and stained crimson. The tree is an upright grower and a very prolific bearer. Elsie Rathke is the best weeping variety and excellent for a large standard. The fruits are large and are produced freely. It is, possibly, not so attractive in colour as the aforementioned, but equally as good for culinary purposes. Victoria is one of the brightest-coloured Crabs, and a very reliable grower, bearing freely when established. Dartmouth is also a good variety, and when the fruits are ripe they have a blue bloom on the crimson, resembling that of a Plum. The fruit is rather small, but excellent for jelly. The Siberian is a very pretty little Crab, not much larger than a Cherry, but well worth growing in a collection.

W. E. WRIGHT.

Wanted: A Society for the protection of rare British plants

Last week I met a well-known man in public affairs in the Royal Horticultural Society's Hall. He told me that in September he found Gentiana pneumonanthe growing wild in Surrey, and that he had dug up 18 plants of it and planted them in his garden. I was furious with him when he told me, but he seemed to have no feeling that he had done anything wrong. As readers know, this is a very scarce native plant. It is probable that it is now almost exterminated from that particular spot. Anyone who robs the country of its flora should be prosecuted. There are Acts for the protection of wild birds, and it is high time that the flora of this country should be protected by law. A Society is now being formed for the protection of wild flowers. It is out to rob the children of their Buttercups and the cyclists of their Bluebells. The Society should go out for the protection of *rare* plants, a very different and difficult problem.

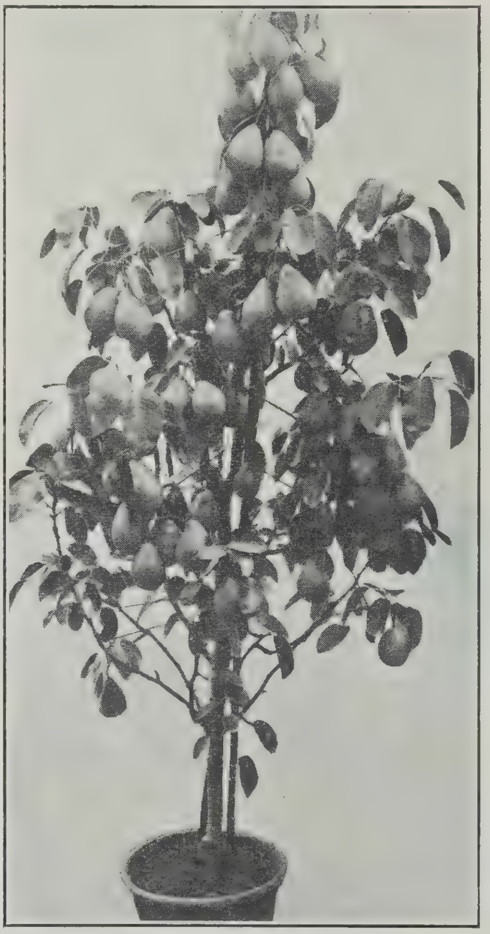
HERBERT COWLEY.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

A letter from New Zealand

I HAVE now received my copies of your paper to September 7th and find them very interesting. I have read of the holiday in Leventina, but you should see New Zealand. This country is considered to be the finest possible to visit. You can get anything to suit you here, from almost tropical to glacier, and from boiling springs and lakes to the cold lakes, and every sort of fishing possible, from the shark downwards. Shooting much the same, and when you come to our city (Christchurch), the Garden City of the Dominion, you will be astonished that such lovely gardens exist. But we have the climate. The sunshine record for Christchurch up to yesterday for this year is 1,536 hours. Ten miles out, where I live, it is at least 100 more hours. Our rainfall to date is one of the best we have had for many years—19·07 inches. Last year at this date it was 13·22 inches.



Pear Triomphe de Vienne as a pot fruit well cropped

This is a useful September Pear much appreciated by those who find Williams too strongly scented

Up to Arthur's Pass, situated on the main range of the Alps, the average rainfall is 150 inches. A large area there is now a National park. This should have been set aside years ago. There was the finest lot of mountain flowers there I ever saw or read of, including the famous Ranunculus, which I see mentioned in GARDENING ILLUSTRATED. I spent two weeks there during Christmas and New Year of 1904. It was sight then. Since then the $5\frac{1}{4}$ m tunnel has been made, and sc cursionists have been there, and always vandals about.

I grow a lot of flowers just fo glorification and to give to thos tunate. Fruits are our specialit sell all our products straight to the We still have a few cases. One selling straight to the consumer m must grow the very best of fruit, own price, and make that price one at all times. One can then tomers year after year without spray 10 times for most Apples, si Peach and Nectarines, and nine for Pears.

A garden near Grasse

I SEND a photograph of the corner of a garden near Grasse, in the Maritime Alps, for your illustrated section. It is noticeable that in that hot, dry climate one depends more for effect on the contrast between stonework (with the great olive-oil jar included) and the light foliage of the Olive tree, and the stiffness of the Cactus plant.

I have also put in a photograph of the washing pool just below the garden.

(MISS) M. F. MALIM.

Lausanne, Switzerland.

Rosa laxa as a stock

The discussion on this stock which appeared in your columns some time ago whetted my curiosity, and I bought a dozen bushes from a well-known firm which uses this stock.

I have learnt my lesson, and I shall certainly never try Laxa again. All my other bushes, which were on Briar and planted at the same time, did extraordinarily well, but those on Laxa were a complete disappointment. They flowered very poorly and did not "get on with it" at all. Even hefty growers like K. of K. made feeble growth. The soil in which the Roses are planted is imported loam, so all had a good chance.

Laxa may give good results in Scotland, but it appears to be hopeless in London.

Putney, S.W. N. LESLIE CAVE.

Ward's Lily (K.W. 6,034)

With reference to the above, I wish to make known the fact that the Lily I advertised in GARDENING ILLUSTRATED, issue November 2nd, under the name of Lilium Wardii is K.W. 6,034, and was advertised as L. Wardii in error.

At present this species has not been authoritatively named, and, for the time being, is known as K.W. 6,034.

Kindly publish this communication in an early issue of GARDENING ILLUSTRATED, as I do not wish to add to any confusion now existing in the nomenclature of Lilies.

Paddock Wood. W. A. CONSTABLE.

Early Catalogues

As drops of rain presage the shower so the early catalogue gives us warning of the flood to follow. Of all literature, I confess that the catalogue of the seedsman, the florist, and the nurseryman gives me the greatest pleasure. What would I give, sometimes, to have a free hand to order not only old favourites, forgotten until their names rise clearly out of the closely-printed lists, but the "novelties" which appear to increase in number year by year, and sufficient time and accommodation to grow them all! Many of these catalogues are more than mere lists of seeds and plants. Carefully compiled, beautifully printed and illustrated, they are works of art, and they deserve a better fate than to be tossed contemptuously on one side. "Only a catalogue," some may say, but it represents much painstaking care, and a not inconsiderable expense. We cannot buy from every seedsman, but, in common courtesy, let us pay them the compliment of reading their catalogues. G.

Flavour in Apples

In his excellent note I see that Mr. W. E. Wright mentions the new dessert Apple, Joybells. I have grown it for a year or two, and find it very good indeed. It comes in about the middle of October and is in season through November. Flesh very tender, full of juice, and nice flavour. It makes a pleasant variant to American Mother, that delicious fruit which surely ranks, at any rate, second or third for choice flavour among all our Apples. I am puzzled by Mr. Wright's remarks about it. He speaks of "the dullness of the fruit." Surely, he does not mean in appearance, for here in all good seasons "Mother" is well coloured a fine, bright red, and this was evident in the various dishes of it at the R.H.S. Fruit Show in October.

A most delectable Apple of which no mention is made by Mr. Wright is Orleans Reinette. I have grown this fruit after having my attention called to it several years ago by Mr. E. A. Bunyard. He, I believe, places it right at the top of the list of well-flavoured Apples, and, after very careful trial, and with many apologies to our old friend, Cox's Orange, I think he is probably right. F. HERBERT CHAPMAN.

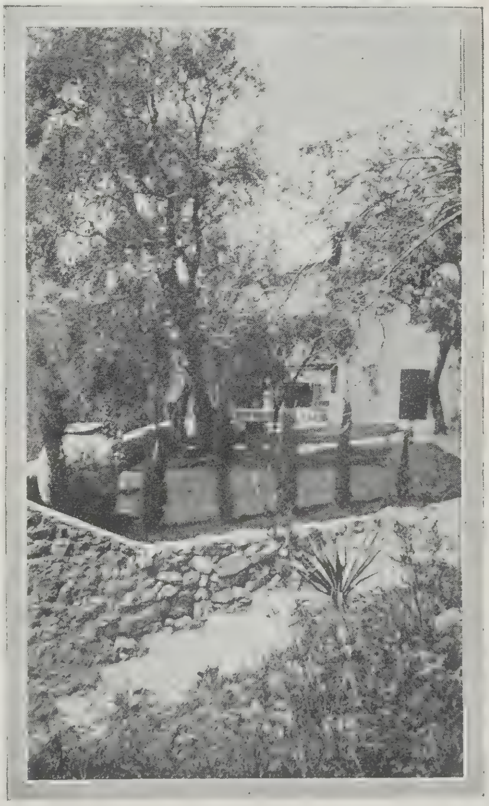
Norwegian Alpines

I have spent a good many summers in Norway and am very much interested in studying the flora there. I made a rock garden on an island, but in the Hardanger district I found it very difficult to find many Alpines. Saxifraga oppositifolia grew easily and well. Above Eide, Saxifraga Cotyledon grew in masses on the cliffs, high up, quite out of the reach of any tourist. So large were the sprays they might nearly have been taken for Tumbling Waters. Linea borealis was lovely, ramping all over the undergrowth in the woods and covered with its masses of little bells, but a hopeless plant to transplant.

Pyrola rotundifolia grew plentifully in deep shade, but P. uniflora was a very rare treasure; I only found it in one or two places. It was very difficult to transport. I tried it two or three times, but with no success.

Arnica grew rather higher up, and Habenaria bifolia (the Butterfly Habenaria) grew in quantities in damp meadows; also Lily of the Valley, but of a very poor kind. I found a few Gentians close to the sea, but I have now forgotten their names.

I found Ranunculus glacialis in quantities

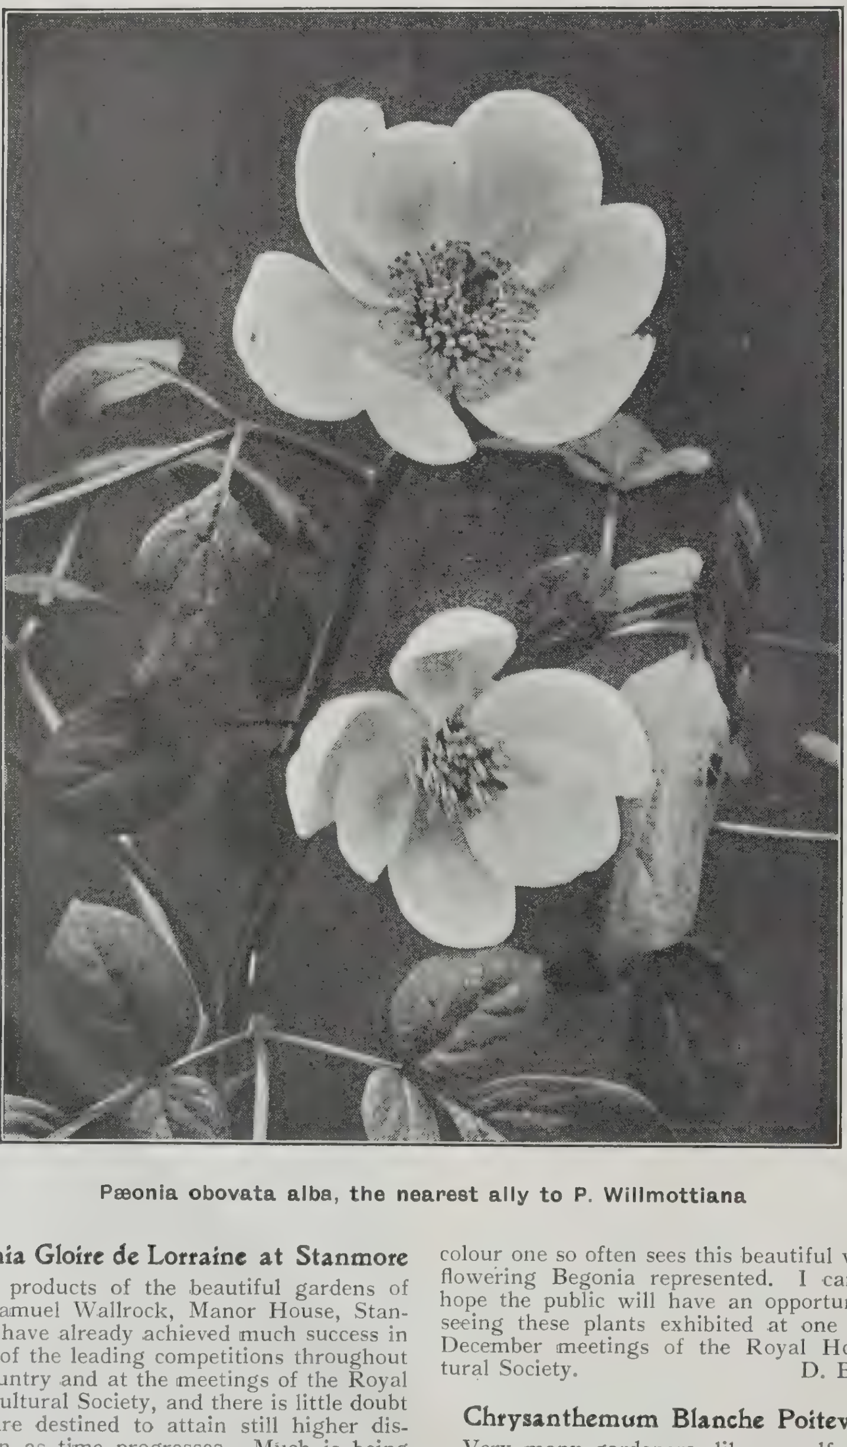


A pleasant garden with Olive trees near Grasse in the Maritime Alps on the heights above Finse, growing in the wet shingle from the melting snows. There were plenty of Pinguicula and Drosera growing in the wet bogs, but I never found Soldanella.

On the whole, I found the Norwegian flora very disappointing, and my rock garden was more than half-filled with Alpines I brought over from England.

The Norwegians round were much interested in it, and used to come over on Sundays in their boats to admire it. They always ended by saying: "Why did I stick all these stones among the pretty flowers?"

Godstone. N. S. C.



Pæonia obovata alba, the nearest ally to P. Willmottiana

Begonia Gloire de Lorraine at Stanmore

The products of the beautiful gardens of Mr. Samuel Wallrock, Manor House, Stanmore, have already achieved much success in many of the leading competitions throughout the country and at the meetings of the Royal Horticultural Society, and there is little doubt they are destined to attain still higher distinction as time progresses. Much is being done in these gardens in preparation for the future, no pains being spared in an endeavour to lay a good foundation for further triumphs. It was my good fortune, a few days since, to pay a visit to these gardens, more especially to inspect the plants growing under glass in this interesting establishment. There was still a splendid lot of Chrysanthemums, both exhibition and decorative sorts being grown in large numbers. There was a grand lot of perpetual-flowering Carnations that merited recognition, but the chief feature on the occasion of my visit was the superbly fine lot of Begonia Gloire de Lorraine, represented by plants exhibiting culture of the best. The plants were large and well proportioned, the foliage being of rich green colour and healthy-looking, and flowering in the greatest profusion, but what struck me most was the beautiful rich pink colouring of these freely-flowered plants. It was most noteworthy and in distinct contrast to the washed-out colour one so often sees this beautiful winter-flowering Begonia represented. I can only hope the public will have an opportunity of seeing these plants exhibited at one of the December meetings of the Royal Horticultural Society. D. B. C.

Chrysanthemum Blanche Poitevene

Very many gardeners, like myself, would be surprised to see the correction asked for by Mr. Mills *re* specimen plant of Blanche du Poitou, illustrated in your issue of November 16th.

There seems to be a great deal of confusion regarding these two varieties, but there need not be, as there is a great difference in
the habit of growth of the t
Blanche Poitevene being very dw
the incurving type of flower.

Chrysanthemums

Twelve good early-flowering varieties for the border

When readers are told that only recently it has been my experience to be in some measure responsible for a trial of early-flowering outdoor Chrysanthemums in which there were no fewer than 290 stocks planted, they will perhaps appreciate my difficulty in being asked to give the names of 12 good early-flowering varieties suitable for border culture. It is very difficult to restrict the list to so few varieties, as there are so many that possess characteristics that commend them for such a purpose. The following, however, are thoroughly good and reliable, and will serve to keep the outdoor garden gay for quite a long period.

Pink Dame.—This plant has its flowers on long slender stems, and it is a profuse and continuous bloom. The plant commences to flower in early August, and continues until the end of October. Height about 2½ feet. Colour, rose-pink with pale centre.

Crimson Circle.—This is another wonderful plant, flowering in profusion over several months. The plant comes into flower in August and continues in good condition until the beginning of November. It bears handsome sprays of rich crimson blossoms that make a splash of colour in the border, and for cut flowers is invaluable. Height about 2½ feet. Has gained several high awards.

Hollicot Yellow (also known as Goldfinder).—Considered by the better authorities to be the best early-flowering yellow variety for the border. The plant has a stiff, erect habit of growth, and develops its sprays of blossoms on stiff, wiry stems, with small foliage. Height 3 feet. Colour, bright yellow.

Mrs. Jack Pearson.—A very early bronze that commences to flower in July and continues until early November. Rather spare habit. The plant continues to develop growths with buds at their apex; these, disbudded, make pretty flowers. Height 3 feet.

Mrs. Phil Page.—This is a bright reddish-chestnut sport from Mrs. Jack Pearson, possessing the same characteristics as the parent plant; the colour is so much better, however. This variety is grown in huge quantities for market.

Hollicot Bronze.—A useful sport from Hollicot Yellow, and generally given the name of Harvester in the specialists' catalogues. Its proper name is that given at the head of this note. The colour is light bronze or yellow shaded bronze, and as such is much valued. Height 3 feet.

Phœnix.—This is a very free-flowering plant, evolving numerous dainty little blossoms of good form in attractive sprays, on a useful length of footstalk. It comes into flower in early August and continues well into October. Colour, crimson-bronze. Height 2½ feet to 3 feet.

Jean.—For its pleasing soft pink colour this variety is included in the select dozen. The flowers are of graceful form, and are developed in beautiful sprays for cutting. At its best during September. Height 3 feet.

Alex Coyle.—This is a dwarf plant with a sturdy habit of growth, developing flowers of good form and of a somewhat unique colour of amber-shaded peach. The plant does not exceed 2 feet in height. Good in September and early October.

Dick Barnes.—For its rich burgundy-coloured flowers this variety is included in the selection. Should be varied in colour. The plant is free-flowering and possesses a stiff, bushy habit of growth. Bright and effective plant in the borders. Height about 2½ feet. September.

Roi des Blancs.—One of the most chaste and dainty of the series. The flowers are small and pleasing, are developed in beautiful sprays, and are pure white. In flower from late August onwards. Height 2½ feet. These plants should be planted fairly close together owing to their spare growth.

September Glory.—The true stock of this variety develops a plant that is a real "Glory" in September and October. The plant yields good sprays and, if disbudded, beautiful individual blooms. Colour, orange-bronze. Height between 2½ feet and 3 feet.

D. B. Crane.

Replanting Herbaceous borders

Any replanting not completed by this date would be all the better if left until the end of March, the plants in the meantime being heeled in in sandy soil, with the exception of the more easily grown plants, such as Michaelmas Daisies, Yarrows, Lythrums, and Helianthus, which can be lifted and divided at any time, and produce much finer results when replanted annually in small pieces than when allowed to become congested.

The Points of a Rock Garden and Some Ways of Achieving Them

By B. H. B. Symons-Jeune

PART II.

How to build rock to look natural

(Continued from page 775)

An outcrop, as its name implies, is an appearance of rock suddenly from an open space. This occurs as often in the lap of a hill as on the side. In either case the rock has to rise out of the earth and go back again. For garden purposes, a group of stones, rather than a single boulder, is needed, and so a rudimentary knowledge of stone is required to put them together. Just as rudimentary knowledge of a subject does not include all variations, so the simplest rules only will be given without considering the more complicated forms. Rock only appears when the stratum has been broken and upheaved, or the ground in front has subsided. The stratum is not all equally solid; parts crumble, and the debris, together with decaying vegetation, covers the remainder wherever it can find a lodging. Therefore, rock only appears on weather-beaten angles. Stone must not be put to show as much on a site as possible. It must only appear when, according to certain rules, it cannot help appearing. When rock appears its formation is governed by the lines of the strata which run through a hill, and the action of weathering on them. Rain will run off according to the incline of a stratum, and, as it does so, will wash deposits on to or away from the rock.

The incline of the stratum is very helpful. It allows rock to rise out of the ground and go back again without appearing incongruous; thus it can be put anywhere, even on a flat site. As it can be seen from every aspect, face, back, and sides have to be considered, and each must be built completely. There will be no possibility or need of hiding an awkward end, for Nature does not end awkwardly. Consider a rectangular block of stone as representing a hard portion of the stratum. The hardest portion will remain the highest, while the rest will weather and crumble partially or entirely. The highest point may come in the middle, when it will tail off on either side, or one end may be more solid than the other; in this case, it will end abruptly, and in the other direction the rock will decline from it. This gives interesting variations in building. It will be seen that the block of stone will be contained within an arc, the highest point of which will touch the strongest and, therefore, highest point. This is important, for it shows how the rock will run to ground logically at each end. The stratum lines never run into each other in such a way that a stone on one bed may rise up into another without a joint being indicated, although a stone within a stratum may disintegrate so that the particu may be composed of several smalle provided that they are contained wi area. Small, jagged points should set upright separately: they woul have mellowed, as used soap does, have disappeared altogether.

The other joints in stone are imp consider. They run through the from the top downwards, not n through the hill. They are cracks and the stone made or emphasised by w ning down them.

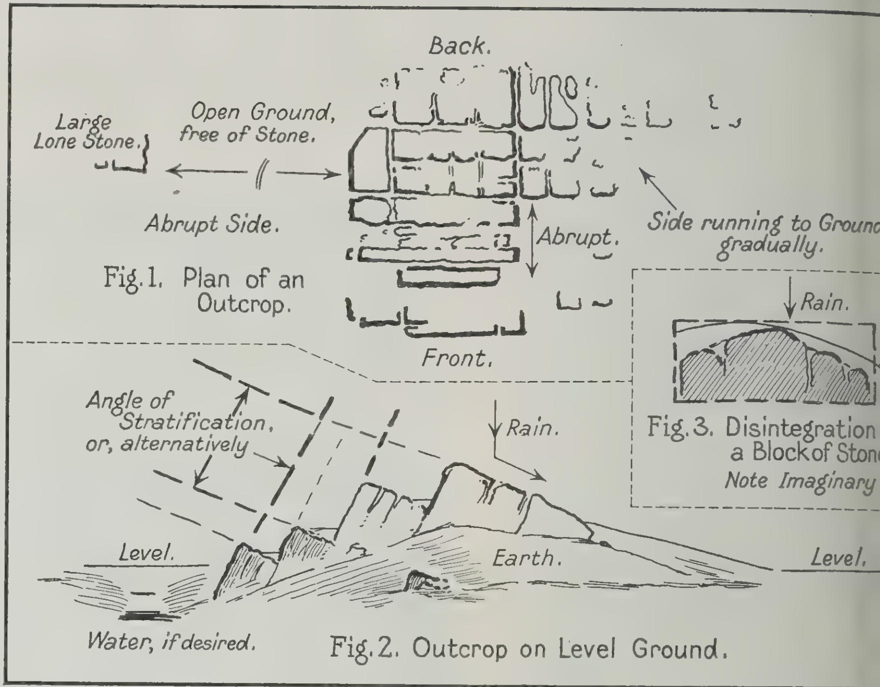

Fig. 1. Plan of an Outcrop.

Fig. 2. Outcrop on Level Ground.

Fig. 3. Disintegration a Block of Ston

They are often continuous, but n sarily so. It will be seen on the fig. 2, that an alternative stratifi marked. Either can be the " lay rock, but not both. If stratification what appears to be the top of the really the face. Thus, a flat stone ti angle may be used, and still be right provided that the stones round it co This steep angle of stratification is invaluable to give a sheer cliff material to hand comes from a thin b ing several layers to attain a heigh even with skilled handling, is alway than one stone.

Even in a small garden a cliff 3 is imposing when solid, which wou as nothing with a joint across it. W groups of rock are needed, one high hill than the other, each group can b as a separate bed.

If any outcrop of stone to be plac sidered primarily as a solid rectangu which has weathered, a useful pla made on the lines shown for any gar

Some useful small trees

ater background of green than in the round to show off the bright colouring wers often gives a better effect in a . Many a bed of brightly flowering plants may be quite transformed by lt of green foliage growing up behind. this purpose few small trees would seem it e purpose so well as dwarf conifers, not only do they provide the required g, but evergreen Conifers give that the winter which is so refreshing o er trees are standing gaunt and bare d them. There are a great number wich to choose for the garden, but it ary to use care in selection, for it is means every Conifer that will suit every en. Those that grow to a great size d be avoided for very small suburban en for, even though they look well for a time while they are small, later become too large for their surround- al are a nuisance to the neighbours he garden itself. These tall varieties not be planted too close to the house esult is the darkening of rooms.

t l gardens will suit Conifers, not even wrf varieties, and the smoke and grime twn are especially abhorrent to them. s they like should be studied, too, for these dwarf Conifers are particular hat kind they have. For those who Cpresses, several dwarf kinds will be which will be suitable for the small garden. Cupressus tetragona is a small bush which becomes very dense with foliage; C. obtusa pygmæa is a very small tree, it has flat branches and reaches a height of about 2 feet; C. obtusa nana grows very densely, and the variety aurea has golden leaves; and there is the variety densa which is even thicker than nana. All these are varieties of the Japanese Cupressus obtusa, and they are slow growers, but most of them are exceptionally useful for the rock garden. Cupressus Lawsoniana nana reaches a height of 5 feet and Fletcheri is a useful bush of pyramid growth; also darleyensis, with its green leaves.

The dwarf kinds of Junipers deserve to be planted in the garden as well, as they will do well in the rock garden or on the lawn, but for preference they like a chalky soil. Juniperus communis nana is very low-growing as it only reaches a height of about 1 foot. That variety of Juniperus communis called aurea has golden leaves, as has nana aurea also. Juniperus communis compressa is useful for rock gardens, and varieties of Juniperus Sabina, such as Knap Hill, tamariscifolia, and humilis, are all worth inclusion. Then other Junipers which are of dwarf habit are varieties of Juniperus virginiana, as globosa and reptans, and varieties of Juniperus chinensis, such as globosa and nana.

Of the Spruces there are several varieties of Picea excelsa which are of dwarf habit. The variety nana is suitable for the rock garden, also humilis, nidiformis, dumosa, capitata, pygmæa, Sargentii, and Gregoryana. Forms of Picea pungens, such as argentea, Kosteriana, and glauca, are all fine trees which reach a height of about 15 feet. Some of the common Spruce varieties are excellent for the rock garden. Of these are reptans, procumbens, and pendula, all very charming trees. If dwarf trees are carefully chosen and the site for them selected with discretion and an eye to the artistic, charming effects may be obtained.

lthough it had to run to ground level on all sides, only 12 tons of stone were used on a site approximately 35 by 140 feet

Magnolia Delavayi

This is a singularly noble evergreen species, well adapted for a south or south-west wall in the milder districts. The great greyish-green leaves are unusually handsome and distinct from the foliage of all other Magnolias, and, indeed, as a fine-leaved shrub alone this species is well worth growing. The flowers are large, egg-shaped until well open, and coloured creamy-white or ivory. Some grand specimens of my acquaintance in the warmer parts of Gloucestershire are characterised by a noble presence with which few shrubs may compare, unless it be the better-known and always lovely M. grandiflora. A Chinese species, M. Delavayi, commences to bloom in July. With a little protection during severe weather it is tolerably hardy and of fairly rapid growth—much more rapid than is M. grandiflora. M. parviflora should be planted by everyone. The perfumed blossoms are produced June-July, pure white buds opening out into chaste salvers, each with a bunch of rosy-red stamens. A most beautiful shrub, and even among its many lovely congeners is conspicuous for its charms. I have found it a good doer and not at all tender in a not too exposed position.

RALPH E. ARNOLD.

Sweet Peas

The ground intended for spring-sown Sweet Peas should be trenched and enriched when the soil is in good working order, a proportion of lime being worked into soils of a heavy character. This will admit of its becoming thoroughly settled down and weathered before it is required for the Peas.

SOME FURTHER NOTES ON AUTUMN COLOUR

SINCE my last notes there has been a month of much colour in the garden. Gales and heavy rain at the end of October did not do so much damage as was expected, but by the beginning of the second week in November, just when there were many plants at their best, a terrific gale with heavy rain finished off most things. It has become quite obvious that if planting for autumn colour is planned it should be carried out with as much shelter as possible—shelter from strong winds which will often strip trees and shrubs of their leaves before they colour, and shelter from frost as far as possible to prolong the colour period as far as possible. In many cases this season seems to have been better than usual as regards colour. In the woods the Beech, Oak, Service Tree, Birch, Hazel, and Bracken have given nearly four weeks of wonderful colouring, the green changing to yellow, gold-bronze, orange, and brown. The Forest of Savernake has been glorious, especially on bright sunny days. Passing through the New Forest the colour was equally good, but the contours of the land made it possible to view much of the colouring from above it, and this seemed to make it more attractive.

A figure of Venus well placed on rising ground above the croquet lawn at Foots Cray Place, Sidcup

A pair of Ionic columns comes into the picture on the right

So much for the natural colourings of the countryside, and now for the garden. During the month—October 18th to November 18th—the following were noted as being all worthy for planting for autumn colour. Rosa lucida, with yellow and crimson foliage; R. nitida, intense deep crimson, with stems thickly with tiny spines are also crimson. It is a plant that should be grown in a mass and the suckers allowed to come up and form a small thicket from 1 foot to 2 feet high. R. macrophylla carries a crop of bottle-shaped fruits, very like those of R. Fargesi and R. Moyesii, which two species are still in good form as regard fruit. Berberis provide much colour in fruit and foliage. Of the fruiting forms, the following are outstanding: Smithiana, aggregata, and the var. Prattii, brachypoda var. aldenhamensis, with its bunches of bright scarlet fruit, and two plants which come from Ireland under these names, Barbarossa and Pirate King—both are heavy fruiters; Giraldii, with large, pear-shaped, brilliant red fruits, with dark crimson stems and brilliant crimson foliage, making this a very desirable plant; pallens, with intense crimson foliage and red stems gives more effect with these than as a fruiting variety; Sieboldii is still very brilliant; Veitchii, an evergreen species, has a fair number of brilliant crimson leaves on it, and its red stems are always attractive; Dielsiana has orange-crimson foliage; heteropoda, intense crimson foliage; rubrostilla has large red fruit and brilliant foliage; virescens should be grown in groups so as to get the effect on its brilliant crimson foliage and the red stems; dictyophylla and its forms are all attractive with red foliage and pink stems covered with white bloom. The Japanese Cherries have been better this year than I can remember, and though the gale stripped a lot of foliage before it got to its best, there was a good show for at least three weeks. Prunus subhirtella ascendens gave a fine orange show, but the type pendula and autumnalis vars. gave nothing. P. incisa, of which I have two forms, one was over in mid-October, the other gave plenty of colour during the first two weeks of November.

The Sorbus section of Pyrus was very good. P. gracilis, brilliant crimson; P. discolor, orange and crimson; P. rufo-ferruginea, bright crimson; P. hupehensis and P. Matsumurana, although quite small plants, gave promise of good colouring in the future. P. Torminalis, the Service Tree, continued for well over a month in its colouring, and branches have been treated in a glycerine solution for keeping throughout the winter.

Photinia villosa, Pyrus arbutifolia, Brilliant, and P. a. erecta were a sheet of vivid scarlet, and spoilt all too quickly by the gale.

Pyrus Tschonoskii, with its young shoots thickly covered with white felt, gave a pleasing mixture of orange, scarlet, and crimson. P. Prattii was spoilt just before the foliage changed colour. P. yunnanensis, P. trilobata, P. coronaria, and P. glaucescens all gave good colourings in the second week of November. P. alnifolia gave rich brown colour like Hornbeam. The Japanese Maples were better than ever, even though some
plants dropped their leaves through
at the roots. Outstanding was A.
lobum and its variety Osakazuki; the
a solid brilliant crimson scarle
some young bushes retained their co
until November 13th. A. palmatur
purpureum, intense crimson; A. septer
elegans, orange and crimson. The A
sectum and its varieties were splenc
did not last as long as usual; dryness
roots was again the cause. The best
was A. d. atropurpureum, the rounded

flower, but very much so in its a
foliage. E. campanulatus has also
good.

Fothergilla major and F. monticola
good for over two weeks, the latter wit
geous crimson and orange shades bei
more attractive than the former with o
yellow colouring. Prunus pumila Besse
quite bright for a week or more.
Mariana began to colour the last we
October and is still good; I hope to see
main so for several weeks. Acer nil
failed to do anything this year beyon
or three leaves, as the gale stripped m
the foliage. Cornus florida rubra a
Nuttallii were both brilliant in their au
foliage. C. Kousa only fair, but this pl
know, suffered from the drought. Ste
andra Tanakæ, with its yellow and
foliage and rich brown stems, is quite
growing. Amelanchier lævis, which
from America recently, is growing in a
shady position, and the autumn foliag
bright yellow. Quercus coccinea splende
been a gorgeous bit of crimson colour fo
weeks and is still good.

Cratægus have given many good au
foliaged plants. C. Haberii turned a
bright yellow, and the following all gave
effective crimson colouring:—C. exclus

an, C. formosa, C. sertata, apart from that coloured in the earlier part of r. Cotoneasters have given a splendid of fruit and foliage Of the foliage s C. foveolata gave rich purplish-crim- sades; C. moupinensis, very similar to ata which has red fruit, gave brilliant n foliage and black berries; C. bullata en better; C. divaricata, C. nitens, C. id. C. obscura, and C. tomentosa have all ceptionally good; the latter is specially g, with large rounded leaves turning to and crimson. Of the fruiting varieties, es nothing to equal C. Farrer sp. 1,325, warf species of Forrest's with small liage and myriads of red berries. C. a will not be at its best until mid- ber, likewise a close ally C. glauco- ll, and I hope they will retain their for several weeks (A. V.!). C. and the var. montana are better than efore; C. disticha, with evergreen Box- liage and large and very shiny bright rries, is noticeable.

ys Aria magnifica lost its foliage early ft its large russety brown fruits hang- bunches; the foliage promised to be good. Ribes americanum gave splendid aret colourings, and I am told to prune ach spring to induce strong young ns and thereby larger foliage. The Ghent s continued to colour, and remained for wo weeks in a blaze of orange and on, the majority being vivid crimson. ear, in spite of the wind and rain, they carrying their foliage longer than and until the first sharp frost of 11 A big clump of Rosa rugosa gave yellow colouring and big, round, th hips of dark crimson. This and the es have given the best of the yellow ings this autumn. Vaccinium corym- n, brilliant scarlet and crimson, began rst week in November, and is still as gt as ever. Eucryphia pinnatifolia was it pretty in its coppery tints. Oxy- on arboreum is beginning to colour, vill be better in a fortnight's time when liage will have changed through yellow, l rose, to richest crimson. On account of te season I consider this a very valuable for autumn—one might almost say r—effect. Amelanchier asiatica, with ge and crimson colouring, is another late ring plant. These three plants are now, several days of heavy rains and strong ns, about all that is left of autumn colour e garden. There are many plants not ioned here simply because I have not them or else they are not large enough to full colouring, or else they were men- d in a previous note a month ago. For nn colour at its best I believe one should both Sheffield Park, in Sussex, and onbirt, in Gloucestershire. Size of speci- and mass of colour will be seen at their there.

F. K.

eranium Russell Prichard

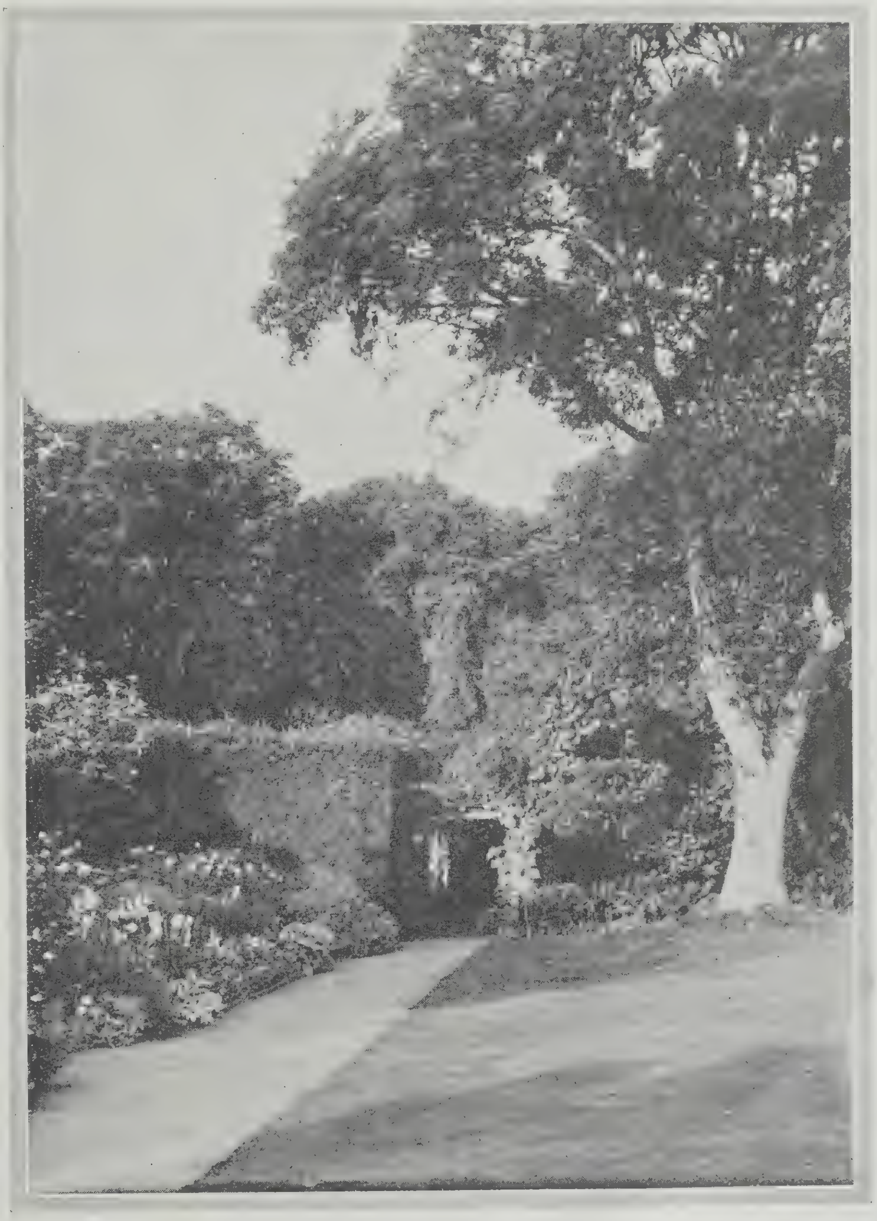
he great variety of hardy Geraniums from h we may make a choice for the border ck garden is almost confusing when we to consider them and to add to our col- ons of these valuable Cranesbills. In ad- n to the numerous species and varieties, ave now a sprinkling of hybrids, among h that called G. Russell Prichard is ing itself quite a welcome plant and is red of a considerable amount of favour. parentage is said to be between the New and G. Traversii and another, believed to form of G. sanguineum. It is a highly sing Cranesbill of rather trailing habit, having silvery leaves and flowers of a m, glowing magenta crimson. It is ing hardy, and the writer's plants did not er in the least from the effects of the intense cold snap last winter, even in a fully exposed position. The flowers are of a good size and are borne for months in summer and even into late autumn. A light soil and a sunny position would appear to be the most suited for G. Russell Prichard.

S. Arnott.

The end of the south border

THE main flower border, facing nearly south, is backed by a high stone wall. A 6 feet wide path runs along it, and parallel with it is a strip of lawn nine or ten paces wide. The border is stopped at the eastern end by a block of Yews that return forward from the wall. There the path runs on through a pergola, at the end of which is a shady summerhouse. An Oak tree stands at the end of the lawn. One of the climbing plants on the pergola is a Vitis Coignettiæ. It has rambled far up above the pergola and now wreathes all the top of an Arbutus. Towards the end of October and later, the Vine foliage takes on a brilliant red colour that appears to be enhanced by being seen just beyond the cool grey of the Oak trunk. The Oak has been inclined to overshadow the end of the border, but has been kept in check by the timely removal of some of its upper growth. There is still one large branch that will have to come away this winter, but it can be cut without disturbing the general balance and symmetry of the tree.

G. J.



The south border and pergola. An Oak tree stands at the end of the lawn

Cerasus Watereriana

Flowering Cherries in great variety make one of the loveliest features in the garden in spring. Of these, none is more beautiful than Cerasus Watereriana. It attains from 12 feet to 15 feet in height, and has a pleasing habit of growth. The flowers are blush pink in colour, freely produced in good bunches, and on stems that are thrown well away from the leaves. At the same time, the stems are firm enough to prevent the flowers from being lashed about by a capricious April storm. The roots appreciate a good soil, to which a little lime rubble has been added if lime is deficient in the soil of the district. I find that if half a barrowful of lime rubble is mixed with the soil, it will answer the purpose well. The present is a suitable time to plant, and when the work is done the soil should be pressed firmly around the roots. Beyond the removal of any dead and obviously misplaced wood, pruning is unnecessary.

G. H. C.

Notes from a Cornish Garden

AGAIN I must emphasise the beauty of the autumn colouring of Stuartia pseudocamellia, now a bush of about 15 feet high and 12 feet through, and all shades of red and orange. It is one of the few which colour well in Cornwall. Azalea pontica is also good, and Cerasus Hisakura, but that is about all in this garden. Whilst of berried shrubs the Mountain Ash has borne well, the Hollies are well furnished so far and Cotoneaster frigida is covered. The variety with yellow berries, which I saw mentioned somewhere of late, must be very ornamental if the colour is clear. At the end of October I had a pleasant surprise, for at the top of the Primula bank appeared white flowers on some small Rhododendron, and, not being able to place it, I went up and found it was a pure white lapponicum, and from the label near by seems to be a variety of R. muliense. It is the only white with which I am acquainted in this series, except a much taller plant supposed to be primulinum x Keiskei, though of the latter parent there is no trace except, perhaps, in the slightly larger flowers.

Last week I had the pleasure of seeing one of the most famous Cornish gardens, and was there led to appreciate the various species of Enkianthus for their autumn colour. They are mostly upright, slender bushes with narrow leaves, and these were bright yellow or red, and made a welcome foil to the various evergreens by which they were surrounded. Of these a group of magnificent trees of Magnolia Delavayi were outstanding, and despite the adverse criticism of certain authorities there is no doubt that, planted in a thin wood, it is one of the finest foliage plants ever introduced. Certainly the flower is dull white and evanescent, but the large leaves are a beautiful dark evergreen when mature and a glorious shade of bronze when young. The evergreen Oaks, too, were very attractive, and of these Quercus cleistocarpa was one of the best. The Maples and Cherries were worth going a long way to see for the varied beauty of their bark, and of the former genus I was allowed to pick some seed of Acer griseum, and, having sown it already, I have hopes of success, though I was once told that it was difficult to germinate.

It is, indeed, some advantage to visit a garden at this time of year, when one can study form and foliage without being distracted by the claims of blossom, which are apt to monopolise one's attention in the spring. And by the way, one can get considerab joyment of form by taking a walk in garden in semi-darkness, and looking the towering shapes of the trees agains sky. Now, as to form, one often doe give one's plants a chance of showing cause they are overcrowded, and I was a case in which this was remedied b removal and consequent visibility of a mense bush of Rhododendron rotundifo better known as R. orbiculare.

The remarkable creeping Rhododer repens was largely represented, sometim the top of retaining walls by the side of and sometimes in the walls thems though in the latter case they had on cently been planted and were quite One good pod of seed did I see, and tha all, and, being of considerable si wondered whether the bumble bee ha some foreign pollen on to the flower.

Happening to mention that I had up a plant of Magnolia nitida, whic owner had kindly given me, on the plea it was young and looked rather soft, I his opinion on pots, their susceptibili changes of temperature, and the difficu keeping them rightly watered. So, o turning home, I had a large pit dug fo aforesaid M. nitida in a sunny spot b with quite 3 feet of good loam, to wh laboriously added—for it was quite 400

An upright Lavatera

Lavatera Olbia fastigiata, flowers rose satin pink—a fine piece of pure colouring

Adenophora Farreri

A robust plant from China with Campanula-like flowers, pale mauve-blue bells, and white styles

These two good flowers of July and August were noted in the hardy plant nurseries of W. Wells, Junr., Merstham the drive—four barrowsful of leaf- and granite-gravel, planted it, and a bodyguard of seedling Rhododen- ampylocarpum x hæmatodes at the nd seven R. Valentinianum in front. efter I put a 3-foot wire-netting guard ro d it and three pans full of dead leaves we the plants, for the place is sunny y perhaps be rather hot for Rhododen- ext summer.

mention of pans leads me to the con- on of tools in general and the ordi- ilk-pan in particular. This is useful eral purposes, especially in a hilly gar- r it is light and it has two handles, so u can take hold of one and rest the e lower edge on your thigh-bone and y it uphill full of good stuff for your or of leaves with which to mulch them. an fill it with stones for a pit where nge is needed or of weeds to be carried n of the various heaps whereon they rot e useful later on. You can carry leaf- granite-gravel, manure, and loam to tting-shed, and thereafter mix and, if ary, sift it into the pan in such quanti- you may desire. Whence it may be ded that this somewhat unconventional well worth adopting.

ook's fork, that long, three-pronged n extolled by Mr. Bowles, is another rable companion. It is quite invalu- r weeding, and will take up anything a big dock or burdock, in attempting , indeed, I have broken one or two. ricking out small seedlings I use an ry kitchen fork, which is not only for raising them from the soil, but also for hoeing and weeding in miniature, ll as in disentangling matted roots. lanting the seedlings, if they are very a pair of watchmaker's forceps is not despised, and the late Mr. John wen years ago initiated me into the use first-class dibber. You take an old rush, break off the brush, take the re- to the grindstone, and sharpen the r end into a blunt point. Then you the thicker end, using the former for g the hole and the latter for pressing il home round the plant. It is hard, it ctically indestructible, and the soil does ick to it as it does to wood.

eteen years ago a certain old colonel me as a wedding present a Shaw's t fly-fisher's knife, and it is still a con- companion, although, like the doll in es Kingsley's "Water Babies," it is what the worse for wear. Part of the -blade is left and half the file. There is of screwdriver at one end and a pair y scissors which are chiefly used for g leaves of seedlings which are damp- ff, and a slender spike which is quite able for undoing knots in string and ionally for disentangling fine roots. there is Messrs. Holtzapfel's combined ng-knife and secateurs, which I have extraordinarily helpful, for one can it in one's pocket without its tearing a and take cuttings or cut dead twigs, rs, or brambles without having to go etch a special tool for doing so. This I ed to a friend the other day, and he ed at it. But this morning, to my ement and pleasure, he sent me a nificent pair of "Rolcut" secateurs, h he, having tried them all, avers is the workmanlike. So I went out and them at once and found them superior to Aubert's which heretofore I had ght far the best of the larger patterns. y, after years of experimenting with g scissors of various sorts, and all of unsatisfactory, I was in the stores last g getting some trout flies, and there saw I had wanted all the time, namely, a small pair of angler's blunt-pointed scissors, which you can keep in your trousers pocket without danger to life or limb, and which are, consequently, always there whenever they are wanted.

PETER THE HERMIT.

Border Phloxes

PHLOXES are indispensable in the flower borders, but want special care in our dry, sandy soil, and especially in a droughty summer, such as the one through which we have just gone. They enjoy good feeding and timely waterings in dry weather. If specimen blooms are wanted, they are best secured from cuttings in the spring, grown on in a liberal compost, when they form a single flowering spike in the late summer. But in the borders they can stand for two years, and are then divided into pieces with three or four flowering crowns. If they are left longer they become woody at the root and do not divide well.

G. J.

Border Phloxes enjoy good feeding

Transplanting Phloxes

For some time I have been interested in Phloxes of the Decussata section. They come into bloom in late summer, just at a time when flowers are not too plentiful. The best of summer species are over, and autumn species have not yet come into bloom. I grow the Phloxes in beds, principally of one variety, for I find that this is the most telling method of display. As this is the season when Phloxes are being planted and transplanted, I would indicate that they rejoice in a deep, well-worked soil. Wherever possible, it is advisable to dig to the depth of 2 feet and apply farmyard manure at the rate of 1 cwt. per 10 square yards. Fortunately, I have not been troubled much with the bacterial disease that affects Phloxes so badly in some places. Though I can claim no scientific backing for the contention, I believe that my immunity is largely due to the fact that I sprinkle good, clean leaf-mould beneath and about the roots when they are planted. About half a bucketful of this substance is used, and a nest is made of it, into which the Phloxes are laid. Any of your readers who may be adding to their collection of this species will find that the following varieties are of special merit and enchanting beauty:—Flambeau (salmon-red), Baron d'Arche (salmon-rose), Doctor Charcot (violet-blue), Griedur (clear pink), Fascination (white, shaded with mauve), Coccinea (vermilion, with a dark centre), and Atala (purple, with white centre).

G. H. C.

Lysimachia Henryii

Few of the Lysimachias or Loosestrifes in cultivation may be classed as flowers for the rock garden, the vast majority being border plants. Old plant though it is, and dubbed as "common" by the connoisseur, the Creeping Jenny L. nummularia and its golden-leaved variety aurea may yet have a place in the rougher parts of the rock garden and may be employed also as a carpeter for early bulbs. A species from China has made its appearance within a comparatively short period of years, and has been acclaimed as a good rock plant. This is L. Henryii, but it is not likely to be appreciated everywhere. It is not too hardy, and, in many gardens, must be kept under glass in winter or it may be lost. This species grows about 6 inches in height. Those who are enamoured of it call it a "grand rock plant," with masses of orange flowers. Many, however, will agree with Farrer's dictum that it is "neither hardy nor choice," and that it is a "lush, leafy thing." If tried it should have a warm, sheltered position, and a young plant or two kept under glass in winter, leaving the parent one in the open to take its chance. Increase is effected by division. To give it a better chance in a wet winter in the open the soil should be light and well drained.

S. ARNOTT.

The Loganberry

Where it succeeds this is a very valuable fruit, but in late districts it seldom ripens, so should not be planted. A strong wire fence 8 feet high is necessary on which to train the growths. The treatment necessary is similar to that required by the Raspberry—old canes removed each autumn and young, strong growths trained in their place.

REMINDERS FOR THE WEEK

Southern and Midland

Hardy Heaths

Everyone whose garden is free from lime should possess a few of the hardy Heaths, and in extensive gardens they should be largely grown, as a nicely arranged Heath garden is sure to become one of the most beautiful and interesting features throughout the whole year. In this case grouping should be resorted to, using the tall-growing species, such as Erica lusitanica, E. australis, E. arborea and its variety alpina, E. mediterranea superba, and the Corsican, E. stricta, in such a way that while each species forms an independent group it acts as a relief to the more lowly forms growing around it. These tall-growing kinds should be planted 4 feet apart, and dwarf kinds, such as E. carnea, E. cinerea, E. ciliaris, and E. tetralix, should be put in at 2 feet from centre to centre of plant. E. vagans and E. vulgaris in all their delightful varieties, and also the early blooming E. Darleyensis, require a distance of 2 feet 6 inches. The present is an excellent time for planting, and no enrichment of the soil should be given.

Garden furniture

Seats, tables, playing tackle, etc., should now be put safely under cover for the winter. Large summerhouses form good storage for most of these. It is advisable to wash all iron and woodwork previous to storing, placing those in need of repair on one side for attention during inclement weather. All netting must be absolutely dry before storing, and a rather drier place is desirable for this costly material than the average summerhouse.

Hepaticas (Anemone)

The present is a good time to make a plantation of these most lovely spring flowers. Position is important, and this should be cool and partially shaded. The soil should consist of two parts rich loam and two parts well-seasoned leaf-mould and sand. With such accommodation there need be no anxiety as to the plants' welfare. There are many lovely kinds, including H. triloba, in blue, pink, and white, one of the most lovely being the soft, pale blue H. Barlowi. There is also the Hungarian H. angulosa and its varieties, of which one of the most desirable is lilacina grandiflora, and the American H. acutiloba.

Climbing Roses and various other climbing plants

These may now be pruned and securely tied into place. Thin congested plants, and those which develop an unusual amount of wood at the base should be pruned severely rather than otherwise, and in the case of ramblers cut the old spent wood out entirely where sufficient good, strong, young growth has been made to take its place. These must be tied securely and be limited in number.

Spraying fruit trees

Following the pruning—and to prevent walking about on newly dug ground—spray the trees with a winter wash, such as caustic alkali, or one of the other winter washes. This will clear the trees of insect life, destroy Lichens and other foreign matter, rendering the trees clean, more healthy, and productive.

Propagating bush fruits

Where a fresh or increased stock is required, desirable cuttings should now be taken and inserted firmly in rather sandy soil on a cool border. Gooseberries, Currants of all kinds, and even Apples may be struck in the same way. The cuttings should be selected from the strongest shoots of the current year and should be from 1 foot to 18 inches in length. A distance of 1 foot between the lines and about 6 inches from plant to plant will suit them.

Peach trees under glass

The pruning, cleansing, and re-training of these must now be undertaken and the houses thoroughly cleansed. Avoid overcrowding of the wood when tying the trees in. A distance of 4 inches or 5 inches should be left between the growths, otherwise congestion will follow in spite of severe disbudding when the trees are again started into growth.

Perpetual flowering Carnations

A few cuttings are now available, and these should be inserted in clean sand in the propagating frame, where, with bottom heat, they will not be long in forming roots.

Bedding plants in frames

These must be watered with great care during the next two months, as growth is practically at a standstill, and an excess of moisture at this period will set up serious damping and loss, especially of very soft-wooded plants. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Figs

This fruit is very subject to attacks of Scale, and during the dormant season is the time to tackle this pest. If disbudding and pinching had proper attention during the growing season very little pruning will be necessary, but any hint of overcrowding must be attended to. The house should be thoroughly cleaned and then the trees treated with a suitable insecticide applied several times at intervals of a few days.

Planting Vines

This is not, of course, the season for the actual planting of the Grape Vine, but as the border has to be well and thoroughly made, it is desirable to have this work put through during the winter months. A detailed account regarding this important operation is impossible here, but, in brief, proper and thorough drainage is the first consideration, while the very best fibrous turf must furnish the major part of the compost, and should be cut and stacked at least nine months before being used.

Renovating old Vines

It is not always allowable to root out old Vines and replace with new canes, and in many cases, if well treated, the old stagers may be induced to produce quite good crops again for a number of years. As with planting new Vines, provide the very best available turfy loam and apply it liberally.

Remaking the border

With a digging-fork carefully dig out from 9 inches to 12 inches of the old soil, starting at the point furthest from the rods. A strip 5 feet to 6 feet wide should be treated at a time, so that the roots be bared for only a short time. In digging out the soil every care must be taken of the roots. When a section has been removed replace at once with the fresh material, making it firm as the work proceeds. The roots should be raised rather than lowered, so the fresh soil must be carefully worked under them.
bone-meal and old lime from a demo
building should be mixed with the loam
no animal manures. A suitable quant
Thomson's Vine Manure, however, is
lent for this purpose, and should be us
directed by the makers.

Nephrolepsis

This fine warm-house Fern is not,
rule, a long liver, or, at all events, do
retain its full beauty for any great len
time. It is advisable, therefore, to be
ing on fresh plants frequently to tak
places of those that are losing their b

occurs when pruning is deferred late
eason. It is advisable to get all the
at fruit early pruned before Christ-
he application of manure cannot be
a better time than just after the prun-
mpleted, for, although the roots may
ery active, they are not entirely dor-
r any length of time, and the winter
rains will carry the manurial properties down to the roots, so that the shoots will find the benefit of it very early in the season, as it is not until the crop is swelling off that the Vines need the utmost assistance that can be given to them; but if the winter application is not enough, it can be supplemented in the growing season by guano applied in liquid form.

There is no difficulty in pruning Vines on the spur system, as it only needs that the leading shoot may be allowed to extend to whatever length there is space for, and that the side-shoot be cut in close to the stem, merely leaving one, or at most two, eyes for fruiting next year, and when these start to grow disbud to one good shoot, and reduce the bunches to one on each shoot if fair-sized bunches are desired. If this is not attended to, a crowd of weakly shoots will spring from each spur, and the Vine will soon be ruined; but under careful management the same rods will continue fruitful for at least 20 years. It is advantageous to carry up a young rod from the base after the old one gets hard and knotty, and then cut it away entirely.

If it is intended to have two rods to each Vine they ought to be trained up from the base. They will grow from 10 feet to 20 feet the first year if well managed. At pruning time—that is now—cut them down to within 3 feet or 4 feet of the base of the rafters, and when they start into growth in the spring train one shoot (the leading one) straight up the rafters. The lateral growths should be trained right and left, and all of them ought to be got down carefully under the trellis-wires. It is also necessary to snap off each alternate growth in some instances. The laterals should be 15 inches apart, less or more. An inch or two must be allowed. As the laterals push out they must be stopped two leaves beyond the bunch of fruit, and all subsequent growths beyond the fruit must be pinched off as soon as they are formed. Each rod may be allowed to carry three or four bunches, and the leading growths should be allowed to run to the top of the house again. At pruning-time cut the laterals back to two eyes, and leave 3 feet or 4 feet on the leading growth. When they start into growth the following season see that the shoots are carefully trained out again at right-angles to the main rod. The pinching of them is very simple. Always stop the laterals at two leaves from the bunch of fruit, and all laterals beyond the fruit should be pinched close back, the first of them to a leaf, but the others clean out as a rule. The rods should be about 3 feet apart.

LATE PRUNING

Many Vines are weakened by bleeding, or running out of the sap, caused by the pruning being deferred until the sap is in motion, or so near to that date, that the cuts have not time to heal over before the sap commences to run out, and when it does so, it is by no means easy to stop it. We impress on all that it is far better to get their Vines pruned directly the leaves drop than defer it until the days lengthen, for if this is done, such a press of work comes all at once that something is sure to suffer; and, although few fruit trees suffer to the same extent as Vines from late pruning, it ought to be the rule to get all pruning done as early as possible; in fact, it is the first winter's job to take in hand, for until that is done little progress can be made with other routine work, such as the manuring and cultivating of the soil about the roots. Although some fruit trees are fruitful without any pruning, the Vine is not one of them.

From Gardening Illustrated

Fifty Years Ago

Melons in pots

MELONS are generally planted out in houses or in hotbeds, both of which entails a considerable amount of time and labour. This season, desiring to have Melons with as little labour as possible, we determined to grow them in pots. About the middle of June, our pot Vines being all cleared out, we plunged our Melons (previously prepared for the purpose, and in 11-inch pots) in a bed of leaves, and trained them in the ordinary way up a trellis. We allowed them to grow to their full length before stopping them, and after the laterals showed fruit, they were stopped at the first leaf beyond the fruit. In this way we were able to cut three or four Melons from a plant averaging 3 lbs. and 4 lbs. each, and one of them weighed 6 lbs. 2 oz. The Melons are now all cut, and Cucumbers, also in pots, occupy their places. Cucumbers grown in pots are better able to withstand the disease than planted out; at least, that is so with us; indeed, we have never been troubled with it. One lot of plants in 11-inch pots are 10 months old and fruiting still. We find Dell's Green Fleshed Melon to do well in pots; on some of our plants we had four beautiful fruits. It is a free setter, strong in constitution, and good in flavour.—J. W. B.

—December 6th, 1879.

The best Potatoes

AMONG the great variety of new Potatoes many are puzzled to select; but Mr. Peter McKinlay, the well-known and most successful Potato grower and raiser, told me the other day that he believed that Woodstock Kidney, taking it in all ways, is the best Potato in cultivation, and the one which he would take with him to a Potatoless island if he were allowed one kind only; but for light and chalky soils he considers the International Kidney almost as well worthy of praise.—V.

—December 6th, 1879.

The Iris Society

Annual Meeting

The writings of the late W. R. Dykes

The annual meeting of the above Society was held at the Grosvenor Hotel, Victoria, on Wednesday, November 20th, 1929, Sir William Lawrence, Bart., occupying the chair.

The Hon. Secretary in his report commented on the steady progress of the Society, both in membership and in the increase of its activities. The 1929 Show held on June 6th and 7th proved a great success, the attendance being much larger than at any previous show, and the number of exhibits showing a large increase on that of 1928. He expressed the gratitude members of the Society felt towards Mr. G. N. Bunyard for his research work on Iris diseases, to Mr. Geo. Dillistone for organizing the annual show, and to Mr. P. R. Barr for undertaking and bringing so near completion the arduous task of compiling a check list of Iris names. He also announced that the Society would in future publish a Year Book in July instead of a Bulletin, but that there would be special information leaflets circulated from time to time dealing with important matters regarding Iris culture.

The Hon. Treasurer presented his balance sheet, and stated that despite the heavy (and in some cases not recurring) expenses incurred during the year, the Society maintained a satisfactory balance in hand.

Both reports were adopted.

The President then announced that at a previous committee meeting it had been decided to recommend the Award of the Foster Memorial Plaque to Mr. G. L. Pilkington, for his enthusiastic and onerous work on behalf of the genus, and for his indefatigable efforts on behalf of the Society. Mr. Pilkington therefore becomes the second English recipient of this honour, and joins a small, select coterie consisting of himself, Mr. George Yeld, Mr. J. C. Wister (United States of America), and Mons. S. Mottett (France). The meeting received the announcement with enthusiastic applause.

The Dykes Memorial Medal for 1930 (for the best seedling Iris) was awarded to Joyance, a new seedling raised by Mrs. Dykes. Thus the first award of this medal for a bearded Iris made in England goes in recognition of the foundation of a new series of seedlings laid by the man in whose honour and memory the medal was instituted, although in this case it represents the actual work of Mrs. Dykes, who continues her late husband's work.

Mr. Geo. Dillistone was then called upon
to report progress with regard to t
lication of the writings of the late Mr
Dykes. He stated these were now r

do not undertake to name more th
varieties at one time.*

ORCHIDS

Stanhopea tigrina

In basket. Has finished flowering. Room for new growths. Please advise concerning future treatment. "ANTHURIUM."

[Stanhopea tigrina requires a warm, buoyant atmosphere when growing, not less than 60 degs., but 65 degs. to 70 degs. is better. Do not re-basket if avoidable. In spring pick out old decayed compost and insert new Osmunda fibre and Sphagnum with a little peat added. In late autumn and winter, if no growths are present, keep cooler —about 60 degs.—and water very occasionally. Watch for Red Spider and Thrip on the leaves. See special article on Stanhopeas next week.]

Oncidium tigrina

This is now in flower and was repotted just prior to purchasing last year. Strong plant. Eight flowers on stem. Room for new bulb. Will it be necessary to repot this plant, please? "ANTHURIUM."

[Should not be necessary to repot Oncidium tigrinum, but next spring see that compost is firm. The pseudo-bulbs should mature shortly after the flowers are finished, and as
there is then no active growth, keep
and dry. Withhold water throug
winter until growth recommences if
do not shrivel.]

nula-like plant from Canada

B.).—The plant of which you sent and dried seed-stems is not a Cam- proper, but a nearly allied plant of tural Order Campanulaceæ (Adeno- the Gland-bearing Bellflower). horas are widely distributed over the arts of China and adjoining countries, but a few species occur in Europe, hey frequent open woodlands in the ins. For some obscure reason these lants are much neglected in our gar- lthough their standard of beauty is a e and well deserving of general culti- In the absence of root-leaves it is ble to be quite sure of the species pped up accidentally in your garden among seedlings of Campanulas, but we think it is safe to assume that your plant is either Adenophora liliiflora or the nearly allied A. latifolia, both species belonging to the European group of this genus. Adenophoras, like most Campanula species, tend to vary to pale or even white flowered forms, and you will probably find that seedlings from your solitary plants will give you the whole range of colour shades, from pure white to violet-blue. See illustration page 824.

Double yellow Tropæolum

(Italia).—It is just possible that on your warm wall this fine old plant would survive the small amount of frost you are accustomed to; in any case, it is worth trying, and could be given a little protection during frosty nights by means of a Fir branch pushed into the wall and allowed to droop over the plant. Of course, it is not hardy in England, and must be propagated from cuttings each year. The experiment with the old trees will be very interesting and we shall be glad to know the results.

Aster Amellus Sonia

(Mrs. Thornely).—This splendid addition to the Amellus section can be obtained from Mr. T. Bones, Cheshunt, who, I believe, was its raiser. In any case, he sent out this useful late-flowering Aster. For the benefit of those readers who know nothing of this plant, I am pleased to repeat that its height is 26 inches, the plant is of compact growth, and develops beautiful flowers 1¾ inches to 2 inches in diameter, and these of an attractive soft pink colour. The plant comes into flower about the middle of September.

D. B. C.

Sweet Peas

(" Interested ").—(1) Most exhibitors pinch their plants and then permit one or two of the strong basal shoots to grow. If the variety is a strong grower two shoots are retained, but with the weaker sorts one only will give best results. (2) If the ground has been liberally manured and well trenched, no artificial manure should be required, but the Sweet Pea must be well supplied with water. Should there be any want of vigour, an occasional soaking of clear soot water and ordinary liquid manure will greatly help, but these should only be applied the day following a good soaking with clear water. (3) It is hardly possible to say just how long any flower-spike will take to develop, and you must have them coming on at intervals and not expect that every bloom will be perfect at any given date. All side-shoots must be pinched out, and it is also well to cut off the tendrils as they appear. (4) Yes; do not be constantly watering, but when the soil is approaching dryness give a thorough soaking.

CHRYSANTHEMUMS

Chrysanthemums of dwarf compact habit

(M. W., Wilton).—So far as we can discover there are no other varieties of Chrysanthemum of the same habit as Blanche Poitevene, but a few good dwarf sorts that might suit are :—Caprice du Printemps, In Memoriam, Ruffisque, Dolores, Jean Paterson, Red Paterson, Malta, David Ingammels, Golden Marvel, Baldock's Crimson, Kathleen Thompson, Mrs. Greening, and Poupre Poitevene. The proper name of the native " Spindle " is Euonymus europæus.

Exhibiting sprays of Chrysanthemums

(Constant Reader).—Your inquiry, " What is a spray of Chrysanthemums? " is a question that is constantly recurring. Hardly a season passes without someone writing explaining trouble at a Chrysanthemum Show because of the want of a proper definition of a spray. There was a lot of trouble at the " National " many years ago attributable to the same cause. The Floral Committee of that Society was asked in 1913 to define " a spray," and after the matter had received its very careful consideration, the following definition of a spray was unanimously adopted : " A spray is the last flowering growth consisting of one stem with a central flower or bud, and with its surrounding flowers or buds." There is a great diversity of opinion as to what constitutes a spray, but the above definition met with general approval and has been generally recognised at exhibitions.

FRUIT

Vines not bearing at the bottom of the canes

(O. V.).—If the roof has a steep pitch the Vines usually produce better and finer bunches at the top than the bottom, and this will always remain so unless the system of training is altered, so as to equalise the flow of the sap. Something may be done in the pruning in autumn by cutting to a good stout bud. The spurs, of course, will look ugly, and there is nothing for it but either to alter the system of training, or cut back to the best buds. See article on Spur-pruning Vines, page 827.

Pear for name

(Tinto).—The Pear you send is most probably Beurré Bachelier, which requires more warmth than you are able to give it, as even in the south on cool soil and as an open standard we find it of little or no use. We would advise you to head your tree down in February and put in a few grafts of Clapp's Favourite, or some other hardy, better-class Pear.

Walnuts not keeping

(Cum).—The Walnut you complain of is the thin shelled variety of the Common Walnut (known to the French as " a coque tendre ") and has shells so thin that they are easily pierced by birds, and when gathered will not keep. Some Walnuts keep well when stored in moist sand in a cool house, but we do not anticipate much success, even if you adopted this method; it would, nevertheless, be worth trying.

Apples not fruiting

Fourteen years ago I planted four Blenheim Orange bush Apple trees in this garden. Two commenced to fruit right away, but two did nothing—not a single Apple for some seven years. I therefore moved these two in 1923 to another and very favourable position, and, of course, in the process, they lost some root, which I thought to be good for them. For three years they did nothing. Then they began to have a little blossom and set a few Apples each year. They have been liberally treated with cow-manure, bone-meal, and lime. They make a lot of new wood each year, even from the lower stem and branches. I have regularly cut out the latter and pruned other shoots back to about three eyes.

Can you suggest a treatment which would bring them into proper bearing? The trees are the same size as the others, which fruit very heavily indeed. Regular Reader.

[The reason why two of your trees fruited well and at an early age while the other two were disappointing is that the latter must have been grafted on to " free " stocks, while the others are on " dwarfing " stocks. You have also aggravated the trouble with the non-bearers by over generosity in the way of manure. To give healthy Apple trees liberal dressings of cow-manure before they have come into full bearing is simply to retard indefinitely that desirable condition. You also prune much too closely. Leave the shoots much longer, especially the leader on each branch, taking care, of course, to prevent overcrowding. Give no more manure until the trees have become fruitful, which they eventually will. This might well be hastened by again lifting the trees and replanting in poorer soil.]

TREES AND SHRUBS

Clematis Sieboldi wanted

(R. J. W., Somerset).—We know of no one who is able to offer this rare plant to-day, and we doubt whether it is obtainable.

Conical-shaped Box trees unsatisfactory

(V. H.).—If there are any signs of buds near the central stems we would advise you to cut the trees in close all the way up and take off a section of the top completely, then if the trees are all right at the roots they will break away and form new columns. We suspect the trees having been dry at some time, which would account for their present condition, and it might be advisable to repot them. The cutting back should be done in April, but the potting may be carried out now.

Dwarf hedge to divide lawn from garden

(R. R.).—Any of the following may be planted now :—Myrtus Luma would make a nice hedge, but naturally grows into a very large shrub, and we are afraid that by the constant cutting necessary to keep it low you would sacrifice its beautiful flowers and fruits. The other Myrtles are liable to be damaged by severe frosts. We recommend Pernettya mucronata, a dwarf, dense growing evergreen with most beautiful berries from September until March, preceded by rather lovely white flowers. We advise you to get a mixed collection in order to enjoy the various coloured fruits, which are white to pink, lilac, crimson, and purple. Berberis subcauliata would also be very lovely for such a position being laden with coral berries through autumn and winter. The grey-leaved Senecio Greyii, yellow flowers, is also worthy of your notice.

VEGETABLES

Diseased Celery

(J. W. S.).—Your Celery is affected with Heart-rot, which is caused by bacteria. All the crop so affected should be destroyed by fire and not thrown on the rubbish-heap to decay. Another season use some superphosphate of lime at the rate of 1 oz. and ½ oz. of sulphate of potash per yard run of trench. These chemicals should be applied when the farmyard manure is added to the trench. Just prior to planting the Celery give the trench a good soaking with permanganate of potash. Use sufficient crystals to colour the water a bright pink. Your other cultural details are correct. It appears to us that you have the disease present in your garden and have rendered the Celery especially liable to attack because you have used manures largely nitrogenous in character. By using the phosphate and potash advised above you should correct this.

MISCELLANEOUS

Poultry manure

I noticed in a recent issue of GARDENING ILLUSTRATED that dry poultry guano can be obtained at 2s. 6d. per cwt. To what use could this material be put at this time of the year? J.

[We are of the opinion that to buy dry poultry manure at this time of the year at the price stated is a sound proposition. To obtain the full benefit of the material it should be made up into a heap as follows :—A layer about 3 inches thick of the guano should be placed on the floor of a shed; this layer should be covered with about an inch of fine soil; alternate layers of manure and soil should be placed in the heap until the desired quantity is in the heap, finally cap the whole with a layer of soil and firm down with the back of a spade. Leave the heap in the shed until April, then chop down with a spade and if at all lumpy press it through a ½-inch sieve. Now add 11 lbs. of kainit and 22 lbs. of superphosphate for every cwt. of the poultry manure used in making the heap and thoroughly mix. A manure so made is a valuable balanced general fertiliser suitable for most garden crops. As a top dressing for lawns, the grass of which is poor, such a mixture has few equals. All vegetables after being thinned out to their final distance would benefit, as would also the flower beds. The mixture takes some preparation, but it does form a valuable manure if kept clear of rain until ready for use. If only small quantities are bought an Apple barrel makes a fine receptacle for compounding the manure in during the winter. A layer of manure and a layer of soil until it is full, plus the potash and phosphate in spring would make valuable material for next summer's exhibition crops. Two ozs. to 4 ozs. per square yard should be used, applied as a top-dressing and hoed in. Poultry manure can, of course, be used as a direct manure when preparing soil for any crop.]

Rare plants wanted

Would you kindly tell me where I can procure plants of Daphne rupestris gloriosa, Chætogastra Lindenia, and Lysimachia Leschenaultii? The average nursery gardener does not keep them, and I want information as to whether they would be hardy enough in Hampshire. A. L. P. B.

[We regret to say that in spite of extensive searching we have been unable to locate these rare plants.]

Chloride of lime

(Marlovian).—The only use we can think of for chloride of lime is as a possible weed-killer. It is useful for destroying Algæ and Mosses growing on brick or slate greenhouse paths, but when used the houses should be well aired during the whole of the period the material remains on the floor, or the fumes will burn any vegetation that happens to be in the house. Unless you wish to do serious damage to your soil chloride of lime must not be used in your garden.

Green Tomato pickle

(W. F. Askem).—Two quarts green Tomatoes, two tablespoonsful salt, 1 quart vinegar, 1 gill treacle or syrup, one tablespoonful mustard, one dessertspoonful curry powder, half teaspoonful mixed spice, three large Onions, ½ teaspoonful cayenne pepper. Wipe the Tomatoes, remove stalks, and cut them in thin slices, sprinkle them with the salt, and let them stand for 24 hours. Put the vinegar, treacle, mustard, curry powder, and spice into a saucepan and bring them almost to boiling point. Add the Tomatoes, the Onion very thinly sliced, and cayenne pepper. Cook for five minutes and pour into bottles or jars and cover in the usual way.

Making chutney

(W. F. Askem).—Two lbs. Apples, 1½ pints vinegar, 1 lb. brown sugar, one tablespoonful salt, one dessertspoonful ground ginger, 1 oz. Garlic, ¼ lb. Tamarinds, ¼ lb. Mustard seed, five or six Shallots, one or two Chillies. Use good, sour baking Apples, peel, core, and slice them, and put them into a lined or earthenware saucepan with the vinegar. Boil until the Apples are soft, then add the sugar, salt, ginger, Mustard seed, and the other
ingredients chopped. Allow the mi
cool, then let it stand in a warm pl
the kitchen fire for several days to
Mustard seed swell. Store in jars,
them in the same way as jam. This
will keep well and is very good.

Sea sand for garden purposes

(F. W.).—The sea sand should pro
ficial to most garden crops, provid
not overdone and that the land receiv
dressing at intervals of manure. Fo
purposes (except in the case of large
such as Chrysanthemums and thing
kind, which require large quantities
we should, however, prefer silver sa
sharp, salt-free sand.

Town gardening

I saw some weeks ago a question
paper as to a suitable book on town
ing. I have found "The Smal
Garden," by H. M. Swanwick, very

[Owing to exigencies of space, we
pelled to hold over many replies
week.—ED.]

LATE NOTE

John Benn Hostel Bazaar

Bouverie House, the Fleet Stre
quarters of Benn Brothers, Ltd., an
ated companies, was the scene on
evening, November 29th, of a very s
bazaar, held in aid of the funds of
Benn Hostel, an institution establish
East End in memory of the late
Benn, the founder of the firm. The
which was organised entirely by the s
held after office hours, was opened
Benn, who said it was an excellent
every business organisation should ha
piece of social work in which all the
could take a personal interest. Th
nine stalls in the fine Reception H
numerous side-shows in various par
building. The public attended
numbers and the proceeds amounted
£200.

Here's a Fine Glasshouse

Handsome to look at—built like a fort—able to withstand the fiercest onslaught of the elements. Glasshouses constructed by Duncan Tucker (Tottenham) Ltd. are built like that. Highest grade materials, long experienced craftsmen—these are the factors that count in a glasshouse. These are the factors that have built up the reputation of this firm. Let Duncan Tucker (Tottenham) Ltd. quote you for a glasshouse that will last a lifetime.

THE "WALDRON
LABEL HOLDE
(Registered No. 742063).

This label-holder retains all the advantages of the good old-fashioned wooden garden label—cheapness and convenience—while eliminating its great drawbacks.

It is indestructible.
It cannot rot off.
It cannot be cut off by the hoe.
It cannot be worked out by the frost.

It holds an ordinary wooden label firmly and clear of splash.

The label is clearly visible, and can be easily changed so that the holder may be used year after year.

Neat and unobtrusive in appearance.

It is made of zinc and galvanised steel.

The Small Rock Garden in Winter

THE average rock garden is too apt to be a barren waste (save, perhaps, for a few Sedums and Saxifrages) during the long winter months, a state of things particularly regrettable when the garden is a conspicuous feature in a restricted "lay-out," so that the sight of its dreariness cannot be avoided. There is not the least necessity that this should be so, for with the aid of dwarf evergreen shrubs and bulbous plants the small, neat unpretentious rock garden can be made quite cheerful, if not absolutely gay, in winter. The winter-flowering Heaths, for instance, will help matters greatly, and as unlike most of the family, they have no objection to lime, they will thrive in almost any soil. The rose-red Erica carnea is specially suitable for the small rock garden, as it only attains a height of some 8 inches or 9 inches, but the slightly taller Erica carnea hybrida (which is a cross between E. carnea and E. Mediterranea) has the advantage of blooming earlier, sometimes beginning to open its deep pink flowers, which it bears in great profusion, in November. Erica Mediterranea is best fitted for the back of the small rock garden, as it grows from 3 feet to [illegible] feet high; its very pale pink blossoms are produced later than those of the Heaths previously mentioned, and it is just a little less hardy. There are white varieties of both E. carnea and E. Mediterranea; these are decidedly pretty, but not quite so floriferous as the pink types.

Of the many dwarf evergreen shrubs that are valuable in the winter rock garden, one of the most effective is Cassinia fulvida, sometimes called the Golden Heath, its bright yellow stems and leaves making a delightful splash of warm colour, especially in sunshine. Admirable, too, are Cupressus Fletcheri and C. minima glauca, both charming little pyramidal shrubs with glaucous-blue foliage; Berberis buxifolia nana, B. Darwinii nana, B. Wallichiana, which has big purple berries, and B. Thunbergii (this last is really deciduous, but if the season be a mild one will retain its leaves in their rich autumn tints far into the winter), Abies excelsa compacta, a Christmas tree in miniature, Juniperus Hibernica compressa, a 12-inch pillar of shining blue-green foliage, and Cotoneaster adpressa, which will lose its leaves when the frosts come, but will keep—if the birds permit—its vivid scarlet berries on its branches for many weeks. Other desirable dwarf shrubs are Daphne Cneorum, Veronica Canterburyensis and V. cupressioides, Hypericum balearicum, and Juniperus prostrata, the last-named forming a glistening blue-green carpet that is most attractive. Another shrub of similar habit to the Juniper is the blue-berried Coprosma acerosa, while a third good carpeter (this, however, is not a shrub) is the evergreen Gaultheria procumbens, with its scarlet berries studding a close-growing mat of vivid green leaves.

With the aid of hardy Heaths the way through the garden is cheerful, if not absolutely gay, in winter

For actual flowers in winter, dependence must be chiefly placed on bulbous plants. Earliest of all, often beginning to bloom in November, is Iris unguicularis (stylosa), which is as lovely as it is capricious! It undoubtedly does best when planted in poor, gritty, even stony soil, pressed hard down, in a sunny place sheltered from cold winds. Slugs are extremely fond of this Iris, and directly there are any signs of flower-buds it should be dressed with alum or soot mixed with sharp cinders. Next in order of flowering to I. unguicularis comes I. histrio, I. histrioides, and then that gem for the rock garden, the violet-scented I. reticulata. The cheery little Winter Aconite should be grown in as large patches as possible (Eranthus Tubergeni is an improvement on the old type, both as regards colour and size), as should Snowdrops in several varieties, of which Galanthus byzantinus is the earliest and biggest, but the winter Crocuses imperatii, susianus, and Sieberi should be planted with a carpeting of Mossy Saxifrage over them, through which they will grow with very pleasing effect. The dainty miniature Narcissi cyclamineus, nanus, minor, minimus, and Bulbicodium (sulphur, yellow, and white) should all find nooks in the small rock garden, of which they are ideal inmates. N. Bulbicodium, by the way, should be grown in pockets of sandy, peaty soil and provided with plenty of moisture during the growing season, otherwise it may fail to establish itself satisfactorily.

R. E. HEAD.

Thinning water plants

Where a lot of thinning or transplanting has to be done among Water Lilies and other lovely plants which have their roots actually in the water, the latter should be drained off, as far as circumstances will permit of its being done, and a few days allowed for the surface to drain, when such work may be carried out.

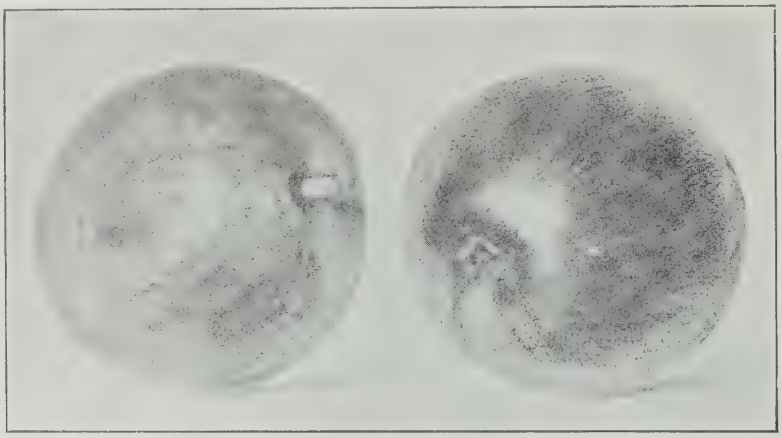
Flavour in Apples

LAXTON'S SUPERB, I think, can be bracketted equal first with Cox's Orange Pippin for flavour. As one follows the other, there need be no worry as to which is the better.
D.

—— In reply to Mr. F. Herbert Chapman's note under the above heading on page 817, *re* my remarks on "American Mother," probably he is correct in pulling me up when I referred to its dullness. I should have said "dark crimson." Mr. Chapman says in good seasons it colours a bright red. It certainly colours a good deal if harvested well, but at its best, by what I have seen of it, it is not to be compared to the brightness of Gascoyne's Scarlet or Rival.

Mr. Chapman mentions Orleans Reinette, an old Apple I have not seen or heard of for many years. The last time I had dealings with it it was grown in pots in the orchard house, as we could not grow it in the open owing to it being subject to canker. Possibly Mr. Bunyard has found the right kind of stock for it. Some of the old Apples are really worth bringing back to notice again.
W. E. WRIGHT.



Laxton's Superb, a valuable late dessert Apple

Wanted: A Society for the protection of rare British plants

Mr. Herbert Cowley has done well to bring the above question before readers of GARDENING ILLUSTRATED (see page 816 in December 7th issue). It is a real shame to see the destruction done in this beautiful vale of Glamorgan by motorists and others pulling up roots of flowers and Ferns which are not likely to be replaced, even by Nature. The worst part about it is that they are usually pulled or dug up in the growing season, and when replanted in the garden there is very little chance of them growing. In these parts there are many species of native Orchis growing wild, but as soon as they are spotted, up they come and are taken away. A true botanist or anyone who knows anything at all about a flower and wanted a plant or two would mark the spot and lift it carefully when growth was completed. I have seen hundreds of Bluebells and Lent Lilies pulled up wholesale when in full bloom. Let the children pick the flowers by all means, but do not take, or rather destroy, the roots or bulbs. This problem could be solved if the Society provided notices for the owners of woods and fields which are open to the public, stating that anyone who destroyed or took away roots or flowers would be prosecuted. As all true garden lovers know, a plant which is growing wild in a wood or grass field is not going to take kindly to the soil in either a front garden or backyard. So leave Nature alone and spare what native plants we have in the country.
W. E. WRIGHT.

Tregarth Gardens, Creigiau, near Cardiff.

—— I read with interest the note in last week's GARDENING ILLUSTRATED *re* the need of a Society for the protection of rare wild flowers. I heartily agree that anyone who up-roots these ought to be punished by law. I feel murderous towards the person who up-rooted Gentiana Pneumonanthe. I do hope that the Society, which you state is out to "rob the children of their Buttercups and the cyclists of their Bluebells," is not Flora's League. I can hardly think so, as that has been in existence for some time, and is out to protect rare wild flowers and the senseless gathering and throwing away immediately of any wild flowers. The roads in spring and summer are strewn with blooms which have been gathered only to throw away.
VICTORIA SLADE.

The Rock Garden Society

One is glad to see that "A. T. J." has written a protest against the suggestion that members of the Society "should be allowed, on producing their membership card, to be shown other members' gardens." From experience one knows only too well that the time and convenience of those to whom the gardens belong would be much encroached upon without a corresponding benefit. It is a pious hope that none but those really interested in rock gardens and their flowers will be members of such a Society. It is a pity, but there are vast numbers of people who, because gardening is fashionable, will talk loudly in praise of flowers, but care nothing for them. And what of the people who come to a garden in hope of being given, if not roots or plants, at least a handful of flowers, and who, now and again, do not hesitate to beg "a bunch of flowers," even if the giving these would tend to destroy the appearance of the garden.

One has had experience of these and other undesirable types of garden visitors, whose visits, frequently at awkward hours, are in sharp contrast to those paid by others w
knowledge of and keen interest in plants
a delight to perceive, and whose departu
viewed with regret. No one would re
permission to visit his garden to the
and would indeed be delighted to see hi

A flood incident

There have been floods everywhere i
lower lands, but we hardly expected to
the floor of a greenhouse flooded, a
steady stream coming from the overflo
tank. This time, however, the dil
agency could not be attributed to Ju
Pluvius, but rather to Bufo vulgaris, f
investigation the gardener found—a fin
toad sitting on the ball-cock! G.

Clerodendron fallax

This Clerodendron is, at the moment,
attractive in the cool stove. Its vivid tr
of bloom are very effective in the dull
and as the plant is of a dwarf habit, i
be very tellingly used for decorative pur
in rooms at the Christmas season. C. f
is easily raised from seeds sown in heat

Lachenalia glaucina

ig January and February, and the seedlings ould be potted on as occasion requires til they are in 7-inch pots, in which good sses are secured. Any ordinary compost its C. fallax, but the plants must at all nes have a little heat. I consider this plant be a good substitute for the Poinsettia—hich does not appear to be so popular as it as in former years.

A Scottish Gardener.

The best twelve Pears

The issue of December 7th was specially teresting—doubtless to others as well as to e—on account of Mr. Bunyard's " Second houghts " concerning the Pear, and the ptes by other writers on such fine varieties Thompson's Pear and Beurre Alexandre icas. I have always been more than dinarily interested in this fruit, and I read th avidity everything which I find written out it. The immediate purpose of this note to ask Mr. Bunyard if, out of his wide perience, he would indicate what, in his inion, is the best dozen. I am well aware at such selections are usually the result of rsonal taste or of the individual palate, t it is always of great interest to learn what ay be the opinions of others, and how far ey coincide with one's own. In order that may not be supposed that I ask for the rpose of argument or of criticism, I append at I consider to be the best dozen—not, wever, in order of merit, but simply as ey occur to me:—Winter Nelis, Josephine Malines, Doyenne du Comice, Thompn's, Fertility, Marie Louise, Louise Bonne Jersey, Chaumontel, Glou Morceau, Van ons, Passe Crasanne, and Beurre Bosc—th Jargonelle, Conference, Beurre Super-, Forelle, Beurre Hardy, and Autumn Bermot as runners-up. But, as I have said, much depends upon the personal equation, en Pears are in question, that it would be difficult, if not impossible, for two men to agree in a selection. Nevertheless the expression of personal preferences is always interesting and instructive, and Mr. Bunyard's contribution would be specially so.

A Scottish Gardener.

Lachenalia glaucina and L. orchioides

In your issue of March 2nd is an excellent article on Lachenalias. I note that all the hybrids described are in shades of yellow, red, and green. Some of our most attractive species are blue. L. orchioides we often call the opal Lachenalia. The flowers are a soft blue, shading off into pink, but even more attractive than this one is L. glaucina; the flowers are larger and flower-spikes longer, and flowers a wonderful soft blue, while the foliage is a pretty soft blue-green. A good pot of these plants makes a lovely show. Perhaps some of your readers could tell me if these are still cultivated in England.

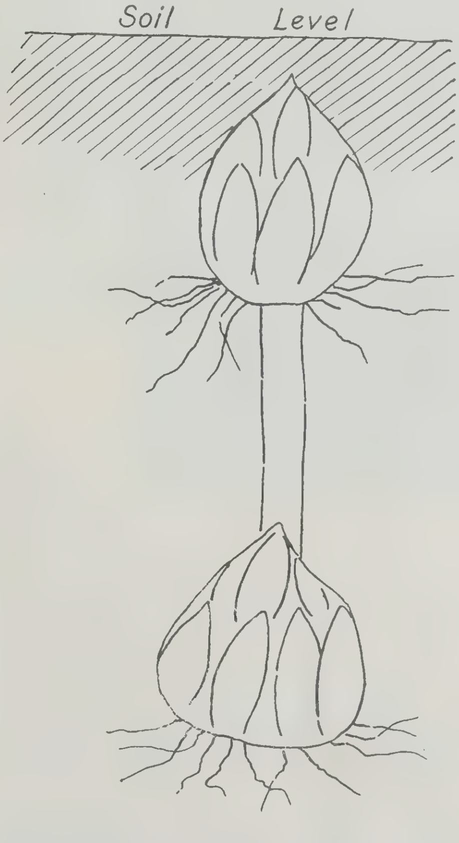
K. C. Stanford.

Bloem Erf, Banhoek, Stellenbosch.

The depth to plant Lilium regale

It may be instructive to fellow-gardeners if I point my own mistake to warn them from the same blunder. I shall give the whole culture as concisely as I can.

I first started L. regale with bought seeds in May, 1926. They germinated within a fortnight in a pan of light soil, where they stayed all summer in the open. In October I put the pan in a cold frame where it was protected from rain, but not from cold.



In March, 1927, before vegetation started, the tiny bulbs were potted separately and plunged in the open garden. Each bulb was about as large as the end of my little finger.

In October I plunged the pots again in the cold frame.

In March, 1928, I blundered, for when I put them definitely in their flowering quarters I followed too closely the advice of books without exercising common sense; that is, I planted them at the required depth for mature adult bulbs, quite oblivious that such baby bulbs must go shallower.

A few flowered all the same, and I supposed that the others were not strong enough.

One thing ought to have given me a hint. In October, 1928, when I was tidying the border, on pulling out a withered regale stem I found bulbils on the buried part, but I was too dense to understand that language, and left the mother bulbs to their fate.

This summer they ought to have all flowered, but did not, so I have been taking them up now, and at last I understand. The bulbs, instead of building flower-stems, have been busy these two last summers in sending up a large new bulb overhead at the requisite depth.

The lesson is, the young seedling bulbs must be planted shallow at first, and will probably dive down alone when their time comes.

Here is a sketch of the double bulb, life-size. The connecting link is a thick yellow tube.

Each bulb has its own roots, and both are quite plump and healthy.

Our garden is rather bleak, on a north slope, with cold, clayey loam, and the Lilies were not protected last winter, but came through all right.

Belgian Reader.

A greenhouse climber

If " Juro " desires to have a climbing plant which will grow most exuberantly; which will, if not drastically dealt with at frequent intervals, speedily take possession of his small greenhouse; which necessitates constant training and regulation; which prevents the plants grown under it from thriving; which is a haven of rest and security for Thrips, Red Spider, and, if it be present within a mile of " Juro's " greenhouse, for Mealy Bug; and which, when in flower, is singularly ineffective and dingy; then by all means let him plant Cobæa scandens, as recommended by " F. Mordaunt " (page 803) in the issue of November 30th. " Juro " would do better were he to plant, if there be a little heat, Stephanotis floribunda, one of the Bougainvilleas, a good form of Heliotrope, or Passiflora cœrulea. The Ivy-leaved or Zonal Pelargoniums, or a climbing Rose, Maréchal Niel or La France, for example, would do well. Solanum jasminoides or Ceanothus Gloire de Versailles, one of the Japanese Honeysuckles or a Wistaria, Clematis indivisa lobata—these would do excellently in an unheated house. But Cobæa scandens or its variegated form are anathema to true believers.

A Scottish Gardener.

Passer domesticus

In your reply to " Worried " *re* the destruction of sparrows (issue November 30th, page 814), I venture to say that should the editorial advice be taken it will only end in ignominy and defeat.

In our great city the sparrow has become a character, an institution, and we have come to think of him in company with other notabilities, such as the friendly pigeons of our squares and open spaces, the pelicans of St. James's Park, and the lions of Trafalgar Square.

When the gentle and learned Linnæus began to name our birds in universal Latin, he designated him " Passer domesticus," the great naturalist recognising that here was no creature of the wilds, never found in the lonely forest, or the deserted mountain, but always in close company and association with man, and as much a part of his everyday surroundings as the utilitarian fowl of the backyard or the lordly swan of our ornamental waters.

Be it admitted that he has many vices,

being greedy, destructive, impertinent, quarrelsome. These are all human vices, no doubt copied from early man, and if this should not be so, a bird so spry and intelligent would have no difficulty in learning them all from the present generation.

To his credit, be it said, he has shunned our more deadly sins, for neither adultery, polygamy, nor divorce are tolerated in sparrow communities.

True it is that at certain times and seasons he plays havoc with our border plants, takes heavy toll of our Crocus, and

> "From the housetops he watches us sowing
> our seeds
> In ample supply for his daily needs."

Yet, as in all great criminals, there still lingers in him a spark of divinity, and those of us who wake and rise early are easily persuaded as we listen to his chirruping in the grey dawn that this is the best he can do by way of returning thanks to that Providence which has ever watched over him, for all the good fare of yesterday, for the food and fighting prospects of the new day, and for not being caught.

Against him it has been said that he has no loveliness, being drab, sooty, tuneless, but beauty and song are graces not in the choice of either man or sparrow.

Ever since A.D. 33, when it is recorded that he was sold in the open market place at five for a farthing, there has been set against him the cruel trap and inveigling net, the poisoned grain, powder, soot, and many other evil inventions of the sparrow clubs, but all in vain, and he may be likened to our own race, having spread, flourished, and been victorious from the east to the west, from the far south to the very confines of the frozen north.

I am on the side of the sparrow.

Hyde Park. T. HAY.

The Crown Imperial

THE Crown Imperial, being a strong grower, needs to be planted in a deep, rich loam which is not too stiff and wet, but well drained to prevent water from standing about the roots. If the soil is not rich it should be made so by the addition of a good dressing of well-decomposed manure. When the plants are well established the stems send out just above the bulbs a number of strong young roots, and then it is that a top-dressing of rich manure greatly benefits the plants. They succeed in any situation, but they are especially fitted for shrubbery borders and outlying situations, where they can remain and establish themselves. It is a good plan to see that the clumps be divided once only in five or six years, for they require to be established to bloom freely. If bulbs are planted now in autumn, Crown Imperial blossoms are in perfection during the month of April. HERBERT PARKER.

Fritillaria imperialis (the Crown Imperial)

Tree Ivies

I am, truth to tell, no great admirer of any of the Hedera family, not even of the golden-leaved or silver-leaved forms, but I cannot withhold a word of praise from one or two of the Tree Ivies. At the present time H. arborescens is very noticeable with its heavy crop of black berries. These, on occasion, and when Holly berries were scarce, I have dipped in red lead—"raddled" them—and they have made passable substitutes for the Holly berries tucked in among the spiny
leaves of the Holly. The Golden Tree
H. aurea, sometimes called aurea mac
is merely a golden form of H. arbores
The Silver Tree Ivy, H. argentea variega
neater and more handsome than the pr
ing—its small leaves are shaded with si
grey, and margined with white. H. ch
carpa is, of course, the yellow-berried
Ivy, and when in full fruit it is by far th
of the family. All are perfectly hardy
require no coddling.

A SCOTTISH GARDEN

Chrysanthemum Framfield and sports

This has become a quite large family
original (Framfield Pink) producing bl
of a soft pink colour. This plant gave a
sport which was named Heston White, g
very extensively at one time by market
private growers for Christmas uses.
sports have appeared here and there
several years past, notably Winter C
probably the best of the series. The c
may be described as deep rich pink. Th
also Salmon Cheer, a salmon sport
Winter Cheer, possessing the same
and flowering at the same time. B
Cheer is an orange-bronze sport from W
Cheer, and Mayfield Sunrise is also an
sport from the same variety. The co
however, is old rose, with gold points.
A. Vanstone is a pure white incurved
from Heston White, but the flowers are l
than those of the latter variety. I be
there are other sports which have not g
the same amount of notoriety as those I
mentioned. D. B.

New certificated Chrysanthem

About a dozen new varieties were
mitted to the Floral Committee of
National Chrysanthemum Society on De
ber 2nd at the New Hall of the Royal H
cultural Society. Varieties that receive
much coveted First Class Certificate of
special Society were the following :—

Gladys Pierson.—A promising decor
flower of Japanese incurved form.
florets are fairly broad and of good le
incurving towards the centre, buildin
grand bloom for market about 6½ in
across. Colour, golden buff. Shown
Messrs. Keith Luxford and Co., Sawbr
worth.

Golden Balcombe.—This is a glori
rich golden-yellow sport from the well-kn
decorative variety Balcombe Beauty.
florets are broad and stiff and of good
stance, and build a good market decor
flower about 6 inches across. Shown
Mr. Thos. Stevenson, Cowley, Middlese

Mrs. A. H. Boaden.—A welcome add
to the smaller-flowered incurved section.
florets are fairly broad and of good substa
and build an attractive incurved bloom a
3½ inches in diameter. Should prove valu
either for exhibition or for decorative
poses. Colour, golden yellow. Shown
Messrs. H. J. Jones, Ryecroft Nurs
Lewisham, S.E.

Kenneth Hastie.—This is a splendid
quisition to the late-flowering Japanese
corative section. The florets are broad,
and of splendid substance, and develo
most attractive bloom about 5 inches in
meter. Colour, bright crimson, lightly ti
gold. Small foliage and wiry stem. Sh
by Mr. H. Shoesmith, Jnr., Mayford,
Woking.

Balcombe Bronze.—One of the most att
tive decorative blooms exhibited on
occasion. Florets of medium width, ev
reflexing, building a beautiful bloom quit

nies in diameter and very full. Colour, bronze, tipped yellow. Shown by Mr. . Vinten, Balcombe, Sussex.

r. Thos. Stevenson, of Cowley, Middle-e exhibited a number of blooms of Yellow ument which he had brought up to the ting a fortnight before. The blooms were in ite good condition after the lapse of a fort-t. Yellow Monument is a sport from the e variety Monument, now so largely wn for exhibition and for decorative uses. ; a plant of easy culture, and is con-ntly good.

r. Stevenson also exhibited Yellow ourite, a pale yellow sport from the chaste e variety known as The Favourite—a ular white sort with market growers, ering at Christmas. Flowers of both e varieties may be cut at a later period Christmas as the quality of the ms is so good. D. B. CRANE.

Peltaria alliacea

ELTARIA is a plant little known in gardens, but useful for filling up spaces among June-flowering plants, such as es and Peonies. It is a Crucifer, coming Isatis and Crambe. It has something appearance of Iberis on stems a foot high. s good to look at, but undesirable to dle, for when touched it gives off a strong ll of Garlic, as is indicated by the specific e. Peltaria is easily raised from seed, ch it forms in quantity, for it may be in-sed by division; but plants in their second from seed are best. G. J.

arge-flowered single Chrysanthemum varieties

N no section of the Chrysanthemum has reater change taken place than in the ingle-flowered type of this flower, and this nge has been gradually progressing during last 15 years. In earlier days a single-ered Chrysanthemum was defined as a er having a single row of ray florets ly disposed around a central disc, and ny good decorative singles used to be con-ed to the rubbish heap because they pos-ed more than the single row of ray florets. he central " eye " or " disc " was said to oo large in proportion to the ray florets, single flowers with only one row of ray ets were of no use to market growers, as would not travel satisfactorily—they ted single Chrysanthemums with an ye " small in proportion to the ray florets, with several rows of stout florets of sub-ce that could travel without damage. As sult of this request, a small sub-committee he National Chrysanthemum Society met, hich the writer was the chairman, and r spending a lot of time discussing the ter, finally re-classified the " singles," iding them up into sub-sections and giving ain well-known varieties as examples of the ective sub-sections. This re-classification duly accepted and passed by the Floral nmittee and the Executive Committee of N.C.S. All certificates for novelties since rded have been made on the basis of this classification. I here give a list of 18 ieties of large-flowered single Chrysanthe-ms, each of which has been shown in ex-ent form during the season that has just cluded. Most of the varieties have from ee to five rows of ray florets. They are he kind that market men grow, and grow uge quantities.

rs. J. Palmer.—A large flower, with eral rows of ray florets. Purest white. orous grower.

obt. Collins.—This is a 6-inch flower of asing form on a stiff, erect stem. Colour, ght rich amber. Good form.

Fusilier.—A striking flower, the colour being crimson-scarlet. Rather late. Much valued for market. A flower of good form.

Rona.—This is a large, rich purple flower of good form, having stout florets. Good grower. Useful for its colour.

Molly Godfrey.—Another large exhibition flower and very dependable. Colour, pink, but the buds must not be retained too early.

Susan.—Rosy sport from Molly Godfrey, with same characteristics as the parent variety.

Bronze Molly.—This is a pleasing bronze sport from Molly Godfrey, and with the other two members of the family makes a beautiful trio.

Isobel Felton.—A very large single with several rows of ray florets. It is a variety that pays for good culture. Colour, pale yellow.

Sportsman.—This grand single was shown in fine form at the " National." It is a large flower, and the colour orange-red and terra-cotta. Good habit.

Audrey.—Another large flower of good form. Colour, yellow, shaded bronze.

Rita.—This is a large flower that has good keeping qualities, and most effective under artificial light. Colour, chestnut, suffused yellow.

Golden Seal.—A flower about 5 inches in diameter, having fairly broad florets of good substance. Colour, buttercup yellow.

Kirkland's Crimson.—A very large, refined flower, shown in grand form at the National and Finchley Shows. The colour is a brilliant crimson.

Catriona.—This is a very distinct flower of good form and highly regarded. Colour, old rose, with narrow white zone round the yellow disc.

Reginald Godfrey.—When well grown this is a valuable large flower for exhibition. Florets broad, slightly incurving at the ends. Colour, chestnut-red, with old gold reverse to the florets.

Phyllis Cooper.—This is not so large as some of the others, but its rich orange-yellow colour makes it indispensable. It has several rows of florets of medium breadth.

Rose Molly.—This is still another sport from Molly Godfrey. The colour in this instance is a deep shade of rose. It was seen in grand form at the " National."

D. B. CRANE.

Peltaria alliacea

A seasonable gift

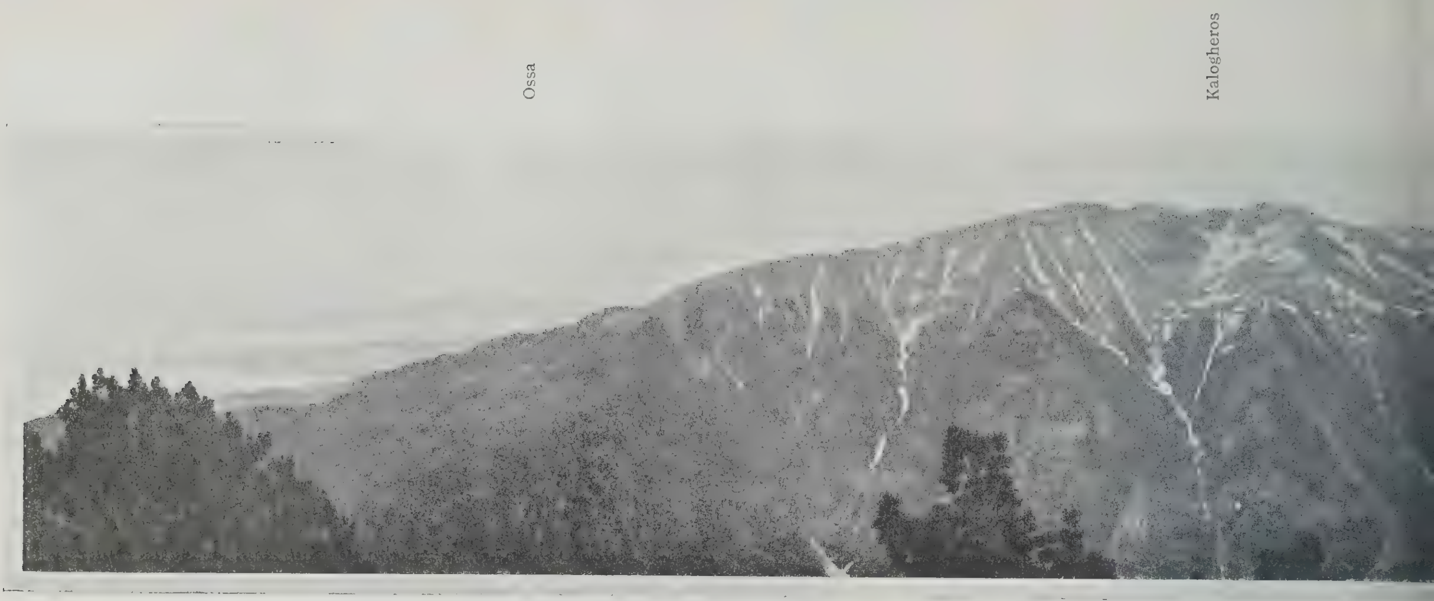
This little note is to remind readers that there is one Christmas gift welcome to all garden lovers—*i.e.*, a year's subscription to GARDENING ILLUSTRATED. Readers who are at a loss to know what to purchase for their gardening friends would do well to follow this suggestion. For the sum of 13s. GARDENING ILLUSTRATED will be stamped, addressed, and posted from the office each week for the whole year. Such a present would be a useful and constant reminder of friendship throughout the coming year.

Planting Peaches

In the future success of the trees the proper preparation of the soil is most important, and no efforts should be spared before planting takes place. The soil first of all should be dug out to the depth of 2 feet or more and if the drainage is not what it should be, put in a 6-inch layer of rubble, clinkers, etc. Over this place a 3-inch layer of turf. A compost should then be prepared of good, turfy loam, coarsely chopped up. To every barrowload add a good portion of old mortar, broken shell, or well-slaked lime. Mix this well with the soil, and if a sprinkling of bonfire refuse is also added, so much the better. The great thing is to keep the soil from binding and to ensure porosity. Fill in the hole with the compost and tread down to a depth which will allow each tree to be planted at the same depth as before. This can be seen by the soil mark on the bark. Plant firmly and finish off with a mulch of light litter. This prepared border should be at least a foot beyond the spread of the roots. F. H.

The vineries

As the wood ripens, pruning should be carried out, and spells of bad weather taken advantage of to have the houses thoroughly cleansed. This is a comparatively easy task where there is no Mealy Bug present, but Vines infested with this terrible pest require to have a great amount of careful work lavished on them to try and check its activities as much as possible.



PANORAMIC VIEW

PLANT COLLECTING ON OLYMPUS

By P. Giuseppi, M.D., F.R.C.S.

MY first visit to Olympus was in 1927, when my wife and myself paid a short visit to the mountain and succeeded in once more finding Jankea Heldreichii at about 5,000 feet. On this trip we also found and brought back live plants of Saxifraga thessalica and Saxifraga scardica, both of which are magnificent plants and quite hardy in the garden. This trip whetted my appetite for more, and at last I succeeded this year in returning for two days to this wonderful mountain chain. Olympus is entirely formed of limestone, and rises within 10 miles of the Ægean to a height of over 9,000 feet. It rises to this height practically from the plain, and the few neighbouring hills are of little importance and do not connect the main chain with any neighbouring mountains. This is doubtless the reason why Jankea Heldreichii and other rock plants are limited in Olympus.

The mountain is a huge amphitheatre, with its concave side facing the east and the whole chain, even at its extreme ends, varies but little in height.

The hollow of the amphitheatre is the gorge of the Vrissula, a torrent rising from the sides of the highest peaks, which are situated at the centre of this mighty arc of mountains.

This year I first saw Olympus from the Salonika main road, a mighty snow-clad mountain, rising from the level plains into the bluest of skies. This main road is so poor that for most of the way we elected to leave its horrible surface and drive over the naked plain, and it was as well that we did so and got used to driving over pathless country, because after we left Gida on the main road and turned southwards the road became a mere track, which eventually came to an end on the marshes. We motored over hills and through unbridged rivers, and finally through the very sea, until at long last we stuck immovably in a ditch on the marshes and were, after much trouble, dragged out by two bullocks led by a charming old Bulgar. We were tired out when at last at 7.30 p.m. we arrived at Katerini; the only thing which cheered us up at all was the glorious view of Olympus in front of us which, like a magnet, drew us ever onwards.
day at 4 a.m. we left for Litochoron, a
town nestling just below our mou

MPUS FROM THE NORTH

ern loop of Olympus rising above a sea ouds. The only water is obtained in from the rocks, and washing under such tions becomes a mere matter of form. ct, I think that the best definition I of an optimist is a man who takes a razor up Olympus.

started for Aghios Elias at about n., and, after some 2½ hours' climb, g which we found Saxifraga scardica, alica, scardica erythrantha, Spruneri, lla, and many others, we came to a from which a complete view of the main could be obtained. In order, from right t, the following points could be dis- ished : Aghios Elias, Stefan, Scala, and, n by Scala, Mitoka, the highest point, a, in front of which are the Vrachos s, then the plain of Bara, then the three , and finally the mighty precipices of heros.

glory of the view is quite beyond de- ion, but perhaps the most impressive were the cone-shaped Aghios Elias, a, and the stupendous cliffs of Kalo- s. On the way to Aghios Elias the ridge which we were walking became very w, but at last we arrived at the foot of al cone of Aghios Elias. From this point scent is easy, but extremely fatiguing. e summit is a small chapel built of rocks hich many names are written; on one rs the names of four brigands, three of have been shot, and the remaining one is captain of one of the three present bands. The summit of Aghios Elias is composed of shale, and from it can be seen a wide panorama of the Ægean and the mountains of North Greece. The view is so sublime that it can be readily realised how much it must have affected the early Greeks and compelled them to place the seat of Zeus on its summit. On descending to the camp I explored the high cliff above it and discovered there the highest plants of Jankea, facing south, at a level of 6,300 feet, and Viola Delphinantha, of which Farrer thinks that it is difficult to grow and not much fun when grown, as it does not flower readily nor give notable pleasure when it does. " It has all the look," he adds, " of a rather miserable Delphinium . . . with specially narrow leaves and erect stems." Farrer cannot possibly have seen the plant, for both its shrubby growth and delightful pink flowers with long spurs are attractive and make us hope that its seeds will germinate.

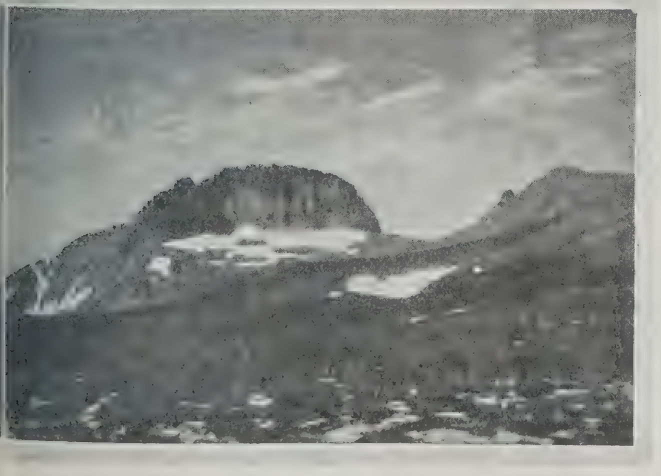
Jankea is very curious in its distribution. I have found it only along the Vrissula, on the eastern slopes of the mountain, and from 500 feet to 6,300 feet, facing all directions, north, south, east, and west, though the best plants grow in the shade. It grows in cracks in limestone rocks, and its lavender flowers, with their crystalline sheen, make it one of our most desirable plants. I think the secret of its growth will prove to be protection from the wet for its leaves and a cool root-run.

I suspect that it will not be found on any of the other slopes of Olympus except the eastern.

Saxifraga scardica was evidently from his description one of Farrer's favourites, and it certainly, with its beautiful white flowers, thoroughly deserves his praises. The rare Saxifraga, described as erythrantha, is perhaps the most beautiful of the plants of Olympus; its flowers are pink of all shades, and quite possibly it is a hybrid between scardica and thessalica.

Saxifraga Spruneri, another of our finds, is composed of rosettes far smaller than those of scardica, and forms masses on the crags. Next day we returned to Litochoron, there to find that one of the brigand bands had descended into the plains and we were compelled by the military to go to Katerini, preceded by a motor-bus carrying armed soldiers.

Our finds on Olympus included, besides the above described plants, the following : Paronychia Kapela, Arenaria rotundifolia, Euphorbia Myrsinites and capitulata, Dianthus hæmatocalyx, Silene Saxifraga, Helleborus cyclophyllus, Ranunculus Sartorianus and brevifolius, Kenera saxatilis, Viola rupestris glaberrima, Geranium sanguineum and macrorrhizum, Sempervivum Heuffellii, Sedum sartorianum amopetalum and magellanse, Saxifraga exarata var. Heldreichii and rotundifolia, Potentilla deorum, Rosa pendulina, Smyrnium rotundifolium, Armeria



Stefan

rumeliaca, Veronica teucroides, Digitalis ambigua, Orabanche caryophyllacea, Sideritis scardica, Salvia argentea, Calamintha grandiflora and Alpina var. granatensis, Globularia cordifolia, Galium purpureum, Achillea holosericea, Stahelina uniflosculosa, Centaurea pindicola, Allium flavum (yellow), Fritillaria mesanensis, Ornithogalum nanum, Crocus veluchensis, and many varieties of Crocus and Scilla. In addition to these we found a sulphur-yellow Linaria and a purple Oxytropis, which are said by Mr. Turrill at Kew to be new species.

Our Olympus holiday was such a great success, not only owing to its floral results, but owing to the wonderful scenery of this great mountain, that in spite of the dangers of its bandits, like a magnet it will draw us to visit it again.

Near Olympus: Peasants dancing the Bolo

Silver Leaf disease and the Silver Leaf Order

Silver Leaf causes quite heavy losses among fruit trees in this country annually. Plum trees suffer most, but the disease also affects Apple and Peach trees and Nectarines, whether grown in the open or under glass. Pear trees, on the other hand, are very rarely attacked, but there are entirely different kinds of plants, such as Laburnums and Horse Chestnuts, that may be devastated by the disease.

Silver Leaf can be recognised easily during the summer months by the fact that the leaves show a curious silvery or leaden sheen. First it appears on one branch and later spreads throughout the tree. Sometimes an affected tree recovers, but more often the branches begin to die back until ultimately the whole tree is killed. For a long time the cause of the disease was a complete mystery, but it is now known to be due to an attack by a fungus. This fungus can only enter the tree through wounds, such as those made in pruning or by the breaking of branches. Once it has entered the disease usually grows rapidly through the wood in all directions. Its progress is marked by a deep brown discoloration, which shows when a silvered branch is cut across. The fungus does not actually enter the silvered leaves, but its presence in the tree causes the upper skin of the leaves to become separated from the cells immediately below, with the result that air penetrates and makes the silvery appearance in the same way as the entry of air into a crack in a block of ice causes the formation of a white streak.

After one or more branches of the tree have been killed, the fungus begins to break out through the dead bark and forms flat, purple-mauve coloured incrustations on it. These produce myriads of minute spores which are shed and carried by the wind to other trees. If they alight on bare cuts or wounds on a tree they may germinate and start the infection afresh in that tree. There is an exception, however, in the summer months, when the tree is capable of forming a barrier of gum on top of an exposed wound so quickly as to protect it from the fungus. If a wound is more than three months old the fungus, likewise, has no power to enter through it.

Now these points are found to be of importance in combating the disease; there is no cure, and burning up infected wood, coupled with prevention of spread, becomes the only remedy. All dead wood bearing the purple-mauve incrustations should be destroyed as soon as possible. It is best done during the summer, when the fungus cannot easily infect other trees. The Silver Leaf Order of 1923 requires this burning to be done by the 15th of July in every year. Where the dead wood on the trunk extends to the ground the whole tree, including the root, must be burned, and the order applies to the wood of any kind of tree; if allowed to multiply on these the spores of the fungus will be carried along to infect other trees and probably valuable fruit trees.

All pruning wounds and other unavoidable injuries to trees should be protected as soon as possible by soft grafting wax or a thick paint, such as white lead paint. Tar or paints in a very liquid condition are found to be of no use for the purpose.

There is one other interesting point about this disease; all varieties, say of Plums, are not equally susceptible to it. Victoria and Czar are very much more so than Yellow Pershore, Rivers' Early, Prolific, Blaisdon Red, and Damascene, whilst Monarch, Purple Egg Plum, and Damsons are midway between the two sets and fairly resistant. This is a good point to know, for in planting young trees in a district where Silver Leaf is rife it is best to choose some variety other than Victoria or Czar.

REMINDERS FOR THE WEEK

Suthern and Midland

ooms

all of us are able to command a supply able manure for the growing of Mush- but where such is available further hould be made up, remembering that eparation of the manure, a suitable ature, and a spawn of good quality are of the utmost importance. A shed has been thatched, both inside and out, nswer admirably, and little or no arti- eat will be necessary, providing new e made up at regular intervals, as the ising therefrom will give all that is re- except a light dewing of floors and vith tepid water occasionally when dry- felt. The beds should be about 2 feet s in depth, bricked in on all sides, and shed will accommodate a bed on each a central path, with each divided in tre, fresh beds can be made up and a nt supply of Mushrooms maintained. the temperature—which should be om 55 degs. to 60 degs.—tend to fall very cold weather, fresh droppings along the path to a depth of 1 foot and daily will renew the warmth.

ng and trenching

is constant and must be pushed for- whenever the conditions of soil and r will permit, as it is most desirable avy land particularly should be turned exposed to the weather over as long d as possible. Many will be faced with reasing difficulty of obtaining manure farmyard type and must resort to reli- tificials, using leaves and other decay- atter for bulk and for producing n.

agus

urther batch of roots must now be in the forcing house or on mild hot- s, and a further supply of Seakale, y, and Dandelion (roots) must be t in to prevent a break occurring in anched material which is so much ated. A further supply of Rhubarb nay also be lifted and left exposed for ys before adding them to the forcing k

house climbers

e should now be taken down from their ts, pruned and cleaned, and looped together so as to enable the washing f wood and glass and limewashing of to proceed before they are again re- Large specimen plants grown in tubs ge pots for decorative purposes and for should be attended to at the same Avoid overcrowding, as this is not only ntal to the plants, but offers refuge to ests.

r-flowering Begonias

e of the earliest of these will have shed looms, especially those which have sed for indoor decoration. Such plants cut back to half their height and in- to throw cuttings. These plants must on the dry side for a time, and grown the glass in a temperature of 50 degs. legs. Watering is of the greatest im- e at this stage, otherwise there will be ency on the part of the plants to rot ase.

Algerian Iris (I. stylosa)

r in blooming with one this year is this ul Iris which should now be given a rotection in the shape of Fir branches, ise the delicate blooms will be spoilt by frosts. A look-out must also be kept for slugs, which eat out the centres of the buds when the latter are emerging from the leaves.

Flowering shrubs for forcing

Most people grow a few of these for forcing, and many are purchased for the same purpose, such as Mollis Azaleas, Lilacs, Staphyleas, Forsythias, Prunus, Viburnums, Roses, etc. The time has now arrived when a small batch should be brought forward in gentle warmth. With the weakening of the Chrysanthemum supply it will be advisable to pot up and place in warmth small batches of prepared bulbs, Spiræas, Dicentra spectabilis, and Solomon's Seal, all of which will be found extremely useful in the New Year.

Preparation for, and planting of, trees and shrubs

This must be brought forward whenever the weather permits. Large specimens are best dealt with during the very cold weather, when such work may be carried out more speedily and with greater comfort. Large specimen Rhododendrons, Azaleas, Andromedas, Enkianthus, etc., may be moved without the slightest anxiety; also the majority of deciduous trees and shrubs. It will, however, assist the latter in becoming re-established if their branches are cut back somewhat.

Fruit store

Maintain an even temperature and air the room when conditions are mild and favourable. Keep stored fruit examined and remove suspicious examples, as one bad fruit may easily start a dozen in decay. Use dessert in rotation, and when at its best only, and dispose of any surplus kinds which are past their best in other ways.

E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Amaryllis

The earlier bulbs will now begin to push up their flower-stems, so they should be set in a light place and given a little more water than formerly. Those still dormant require very little water, but it is a mistake to keep the soil so dry at any time as to kill the roots, for it must be borne in mind that a bulb with roots intact has much less to struggle against when growth becomes active than has one that has first of all to produce fresh roots. A temperature of about 55 degs. is ample at this period.

Bring in more bulbs

A further batch of the various kinds should now be moved from the "plunge" to a cold frame, where they should be kept for 10 days prior to being taken into a heated house or pit. Daffodils require longer to root than the majority of the others, but even these should now be ready. Stand them for a fortnight in a cold frame and they will come on much better than they would if taken direct to a heated structure. Very gentle heat, especially at first, must be accorded this bulb.

The cold frame

The plants that can be safely wintered in a cold frame are so nearly hardy that it is only when sharp frosts threaten that the sashes should be closed and a mat thrown over the glass. At other times keep the sashes well tilted at the back, and so permit of a circulation of fresh air among the plants, while at the same time they are shielded from rain. It is damp, rather than cold, that is the cause of losses during the winter and early spring months.

Lime for the garden

A kitchen garden that is annually dressed with farmyard manure is certain in time to become "sick," and the best "medicine" it can have is a moderate dressing of fresh lime. This can be used in several forms, but the most easily applied is that known as ground lime. In this form it is easily applied and is very effective. It should be evenly scattered over the selected plots at the rate of, for heavy land, 8 ozs. per square yard, while lighter soils should have less.

How and when to apply

It is often vaguely advised "to spread it on the surface and dig it in." This is a wasteful procedure, as the mineral has a natural tendency to work downwards. It is easy to see, therefore, that when dug deeply into the ground it is only the subsoil that is benefited, the top spit being left as it was. The most effective and economical method is first to dig the ground, and in early spring scatter the lime evenly all over the surface and then *lightly* fork it in. This can be done at any time if three weeks or so is permitted to elapse before sowing or planting is carried out.

Protecting Celery

Not infrequently this valuable vegetable suffers badly from damping during the winter months if nothing is done to throw off excessive rain or snow. Long straw laid over the ridges like thatch is excellent, but is apt to be displaced by the wind unless means are taken to prevent this happening. Old corrugated iron roofing, if available, is probably as good as anything and can easily be moved when necessary. Fix it so that the rain is shed away from the roots of the plants.

Jerusalem Artichokes

This is one of the plants that will thrive all right for a series of years on the same site, providing it is well manured and dug each season. It is well, therefore, to have the crop lifted now and stored against a north wall, where, if covered with sifted coal ashes, the tubers will be safe from weather and vermin. The ground can then be manured and well dug, and the planting will thus be a simple matter in February or March.

Seed Potatoes

A periodic overhaul of these is necessary so as to see how the tubers are wintering. Not all of us are blessed with a cool yet frost-proof shed or cellar in which to store them, so it frequently happens that growth sets in prematurely and the "sets" run considerable risk of being permanently ruined. It is, of course, the larger "eyes" that start away first, and if this be permitted to go on, the "seed" loses most of its vitality, so it becomes necessary to rub out these started growths and trust the secondary "eyes" to produce good sprouts.

Chrysanthemum cuttings

No suitable cuttings should now be allowed to grow too long, but as soon as they are 3 inches to 4 inches high have them off and inserted round the edges of 3-inch pots filled with very sandy compost. Make firm, and then give a good watering. If the pots are set on a cool ash bottom or in shallow boxes having some sifted leaf-mould laid in the bottoms, the cuttings will root all right, although they may take a little longer to do so than they would in a close case. In the latter, however, many would be lost through damping-off.

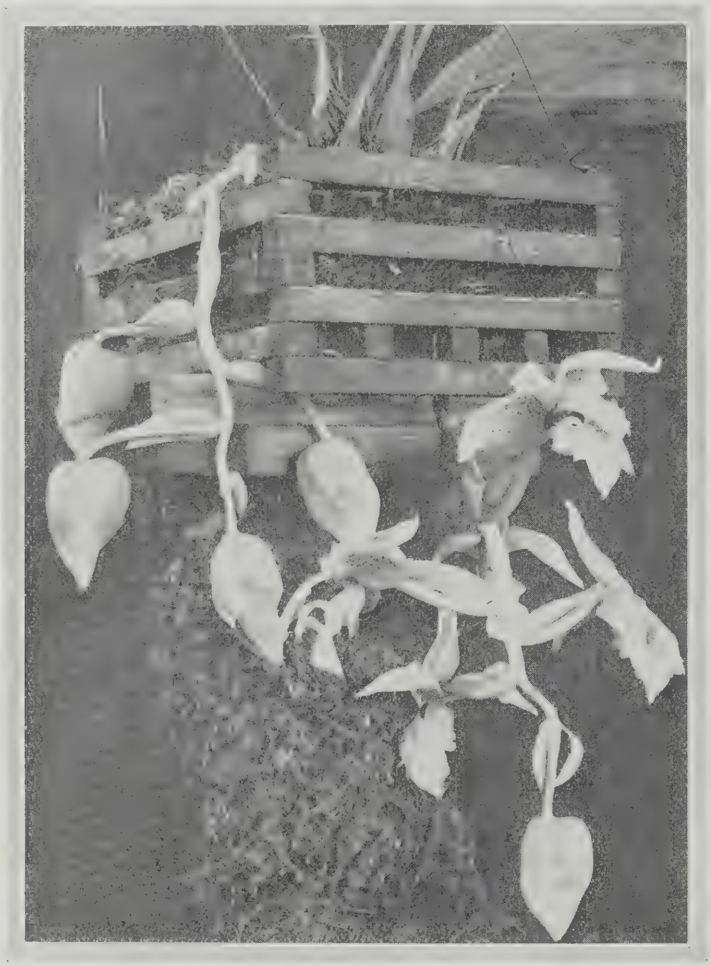
Preston House Gardens, Linlithgow.

Stanhopeas

EVEN among Orchids this genus is noticeable for the size, curious shape, and fragrance of the flowers, and, above all, for the extraordinary manner in which the energies of each flower appear to be concentrated in its labellum, as a means to the end, common to all flowers, to obtain fertilisation, so developing seed and obtaining the continuance of the species.

The greater number of Orchids are entirely dependent on insect agency to ensure fertilisation and avoid inbreeding by the transference of pollen to a stigma situated on a different flower either on the same spike or on another plant.



Stanhopea Wardii with two flower spikes, showing details of the flowers in different stages

The left-hand inflorescence is still in the bud state, with the sepals completely enclosing the vital parts of the flower. In the left-hand flower of the other spike the arched column and the two horns are clearly shown, as is the epichil, slightly reflexed, as if to give easier access to an insect

As some special insect has usually to be attracted, with Orchids there is commonly a fixed flowering season for each species and often a marked attraction to induce the particular kind of insect to visit the flower.

In Stanhopeas, though the flowers are comparatively fugitive, lasting but from three days to a week, they are of considerable size, moderately or even highly coloured, and often powerfully scented, while the lip is developed to a remarkable extent. Variation is present, more or less, in each species, but always that organ is the heaviest portion of the flower, with a highly polished, wax-like surface, thick in substance, in decided contrast to the flimsy texture of the sepals and petals. Further, it is divided into three well-marked sections, the outer usually heart-shaped, with rounded, waved edges, termed the epichil. The central portion, known as the mesochil, reduced in width, but thickened for strength, gives rise to two prominent horns, so curved and inclined as to guide the favoured insect beneath the arched column. Probably for the sake of economising material there is often a deep groove on its upper surface. The basal portion of the lip—the hypochil—generally consists of a deep cavity with thick, rounded edges. The brightest colouring of the flower is usually concentrated here, and the scent is strongest, so that the insect is lured from the epichil, between the horns, to the base of the lip, passing beneath the column. A projection from the column cap is so placed that in retreating from the flower the pollen adheres to the insect.

The sepals and petals are for attraction, to an extent, and also for protection, chiefly while the flowers are in the bud state.

The illustration shows a plant of S. Wardii with two spikes, the left-hand inflorescence still in the bud state, with the sepals completely enclosing the vital parts of the flower. In the left-hand flower of the other spike the arched column and the two horns are clearly shown, as is the epichil, slightly reflexed, as if to give easier access to an insect.

In the natural flower the sepals are broadly triangular in outline, over 2 inches long by $1\frac{1}{2}$ inches broad. Slightly concave, they retain their expanded shape, but the smaller
petals, though expanded at first, as

ort on conditions of horticultural crops

ccoli (hearting).—Excellent heads being Cornwall. Crop late in Kent. Rather ointing in Middlesex, and below aver- Yorks., but elsewhere making good ess generally.

ssels Sprouts.—Crop and quality below ge in Beds. and Hunts. In Essex the crop has recovered. Late in Kent and likely to be short. Good in Middlesex and Lancs.

Cabbage (autumn-sown).—Making good progress generally, though backward in Lincs. (Holland) and Kent.

Celery.—In Lincs. (Lindsey) most of the best heads are being cleared, especially from Blackland, and supplies of good material are short. Only fair in Warpland, and from this soil there is likely to be a short supply for Christmas. In Cambs. patchy. Generally good in Norfolk and on fenlands in Hunts. Below average in Isle of Ely, and poor in Lancs. and Lincs. (Holland).

Leeks.—Generally below average. Reported to look well in Middlesex, where first batches are being marketed.

Onions (autumn-sown).—Making good growth on the whole. In Essex, however, the crop is patchy and progress slow.

Parsnips.—In Cambs. much below average. Fair in Middlesex, and good in Devon, though in both counties disease is prevalent in places. In Yorks. the crop has been reduced owing to attacks of fly, and is below average.

Savoys.—Good in Lancs. and Northumberland. Average in Yorks. Below average in Essex, and poor in Lancs. (Holland). Good supplies available in Middlesex.

Turnips.—Fair generally. Good growth in Middlesex.

Carnations, Perpetual (under glass).—Satisfactory.

Chrysanthemums (indoor).—Blooms good in quality and yield satisfactory generally. Only fair in Herts., where many plants are small.

Roses (under glass).—Satisfactory.

Aberystwyth Chrysanthemum Show

In our report of the Aberystwyth Chrysanthemum Show (November 23rd issue) we omitted the name of Mr. H. Sheraton, the Hon. Secretary and Treasurer of the Society, who was successful in securing the G.I. Medal. Mr. Sheraton has been runner-up for our medal several times, only missing it by one or two points on each occasion. It was offered for most points in the amateurs' section. Mr. H. F. Elenor, Chairman of the Committee, and last year's winner of the G.I. Medal, was successful in securing the Silver Cup in the keenly contested class for a decorated table of cut blooms.

Derbyshire Horticultural Association

At the monthly meeting of the Derbyshire Horticultural Association, held at the Guild Hall, Derby, on Monday evening, December 2nd, Mr. J. Woodward, of Draycott, was awarded a certificate of merit and first prize for two dishes of Gascoyne's Scarlet and Peasgood Nonsuch Apples in the professional class, Mrs. E. S. Ayre, The Limes, Mickleover, being a close second with Lane's Prince Albert and Allington Pippin (gardener Mr. G. E. Palfreyman).

In the amateur section, Mr. C. S. Buck, Derby, took first prize and certificate with a dish of Charles Ross, the following members also competing with the varieties named :—Mr. W. Whitehurst, Derby, Lane's Prince Albert; Mr. W. L. Armin, Ockbrook, Newton Wonder; Mr. T. Woolley, Brailsford, Bramley's Seedling; and Mr. H. W. Banks, Derby, Lord Derby. The fruit was afterwards sold for the hospital funds.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

TREES AND SHRUBS

Hedge required to keep out wild pigs in Western Uganda

I was much interested in your reply to a query for an impenetrable hedge. Can you recommend a suitable hedge for a garden near Ruwenzori, in Western Uganda, guaranteed to keep out wild pigs? Barbed wire is useless. Soil volcanic, and everything grows extremely quickly. Altitude, 5,000 feet. It is said that Mauritius Thorn is the only hedge that will keep them out. Is this possibly the same as Ægle Sepiaria? How can one get hold of the seed of Ægle Sepiaria? It would be the only method of getting it there. I am told that another garden pest is "hippos," but I expect no hedge would be effective against them.

M. T.

[Having experienced the strength and determination of tame pigs reared en masse under free woodland conditions in this country, we certainly cannot recommend anything of a living nature which could hold wild pigs at bay. We would suggest a stout iron fence or one of stout timber bearings and cross rails, with ordinary pig fencing wire between, such as is used by breeders in this country. Either could be planted on the inner side with Ægle Sepiaria or the American Cockspur Thorn (Cratægus Crus-Galli). We do not recollect the Mauritius Thorn. Nor do we find seeds of Ægle Sepiaria listed, either in this country or by Continental seedsmen. You might try the Yokohama Nursery Co., Ltd., No. 21-35, Nakamura, Yokohama, Japan.]

Plane tree leaves

I should be much obliged if you would tell me if it is a fact that all Plane tree leaves should be burnt? We have a very large Plane tree with Chestnut and other trees on either side of it. The leaves get hopelessly mixed up, and we have stored them all in a pit. Would lime counteract the bad effect of the Plane tree leaves? Have they an injurious effect on plants?

A. M. H.

[While Plane tree leaves do not make good leaf-mould, we would not say that they are actively injurious to plants. Few gardeners, however, preserve this kind of leaf, but a few mixed with other good kinds like Oak, Beech, and Elm will do no appreciable harm. You should note, however, that Horse Chestnut, Walnut, and Lime tree leaves do not make good leaf-mould. We do not think that the use of lime would do much good. Better, as far as possible, burn the kinds above named.]

Daphne indica foliage

(F. M. Wilson).—We have carefully examined the foliage sent for examination and have failed to find a fungus that could be connected with the damage. It appears to us that the spotting has been caused by insect attack. Some piercing-mouthed insect has been piercing the leaves and sucking out the cell sap. After the injury the tissue has turned brown. Keep a careful watch for insect attack next year, and when noted use a suitable insecticide.

When to plant Azara microphylla

(Italia).—The present is an excellent time for planting this Chilian evergreen, which usually transplants very well, as it carries a nice ball of soil and fibrous roots. After planting, give a good soaking of water and a mulch of litter. Also see that the tree does not suffer from want of moisture until growth is evident. This is important during April and May, especially in your country.

Small-leaved Ivies (Hedera)

(G. T. B. B.).—The following are recommended:—Hedera Cænwoodiana, H. digitata, H. Donerailensis, H. tricolor minor, H. elegantissima.

Planting flowering shrubs

(Constant Reader).—Both the Spiræa and Philadelphus should be planted at 3 feet apart. All the Berberis should be planted at 4 feet apart, otherwise they become a congested mass, without individual form or outline, within three or four years.

CHRYSANTHEMUMS

Early-flowering Chrysanthemums

(F. W., Oxford).—There is an article in our issue for December 7th, page 819, giving 12 good early-flowering Chrysanthemums for the border. It is our intention to publish other articles on Chrysanthemums in forthcoming issues, which will, no doubt, be of special interest to you.

Chrysanthemums immature

(H. Green).—There appear to be several causes for the unsatisfactory condition of your Chrysanthemums. We should imagine that you have either potted too loosely or else been over-feeding them, while damp in the atmosphere of the house and lack of fresh air are very likely to have added their quota. The Chrysanthemum is very hardy and must have abundance of fresh air, both day and night, when frost is absent, while a damp, muggy atmosphere it quickly resents. The stems sent are very soft and immature, which would seem to indicate loose potting or over-feeding, to which we have already alluded.

Chrysanthemum questions

(M. S.).—While we are always anxious to give full information on any gardening subject, to attempt to give the dates when the various varieties of single-flowered Chrysanthemums require to be pinched is rather more than we can find space for. Had you given a list of those you wish to grow, we could have managed it. Speaking generally, however, we would say that the bulk of the late-flowering singles do well if pinched early in April. Some, of course, could be again pinched in June, which would slightly retard the date of flowering. It is difficult, especially in the south, to have singles last till Christmas, but by pinching well back in July there should be some that could be kept back for that season. If late decorative varieties are pinched in April, and again about the middle of June, they should bloom at Christmas. Red varieties blooming in October are by no means numerous, but these may suit:—Brightness, Champagne, Charlotte Harley, Ernest Baltet, Red Almirante, Red Emperor, R. C. Collicott, and Wembley. November red decorative varieties include Brilliant, Crimson King, Emperor, Felix, In Memoriam, Market Red, Mrs. R. Collins, Mrs. R. F. Felton, Poupre Poitevine, and Miss Eva Hudd. December-flowering red Chrysanthemums are distinctly scarce, Baldock's Crimson, Black Knight, Dr. Jacobs, and Crimson Conquest pretty well exhausting the list. The Chrysanthemum articles appearing in our pages should prove helpful, especially in selections.

Chrysanthemum cuttings

You recommend that pots of cuttings should be set on a coal-ash bed in a cool house. For those with only a cool house of an ornamental kind attached to a residence, this would seem to be untidy. Is the ash bed a necessity, and what exactly is its use?

E. McA.

[Ashes form a cool bottom for pots of cuttings and generate a little moisture which assists in keeping the cuttings from flagging. They also prevent worms entering the pots to a large extent and allow of a bell glass or small hand frame to find its own air-tight settlement. Gravel can be used in exactly the same way, or even slates, but whatever the propagating case may be it is absolutely essential that it is made airtight.]

FLOWER GARDEN

Morning Glory

(Mrs. M. S.).—The seed should be sown in the middle of February, singly in pots, and grown on in the greenhouse till planting out time in early June. Your Indian seed is no doubt that of the kind that flowers too late in England, but that is excellent under glass where it can have room to ramble. It is important when buying seed in England for outdoor planting to make it quite clear that the earlier blooming kind only is desired.

(A. C. Rolt).—There are two forms of this that are sent out by seedsmen, an early and a late blooming kind. It is well in ordering the seed not to say merely Ipomæa rubrocœrulea Heavenly Blue, but to make it quite clear that the early flowering kind only is desired. The later kind is a much stronger growing plant, quickly covering a large space of wall, and if flower-buds show at all they come too late, and are sure to be destroyed by frost. It may be that it is a useful flowering plant in Cornwall and other favoured parts of our climate, but it is only the early flowering kind, which is altogether a less vigorous plant, that can be trusted elsewhere.

How to grow Gentiana sino-ornata and Gentiana Farreri

Will you please give me some advice on growing Gentiana sino-ornata and G. Farreri? The G. acaulis flourishes here, but I find the other two more difficult. Do they like leaf-soil and peat? The garden is heavy clay. What is the best time to propagate, and do they grow from cuttings or solely from division of roots? I divide the G. acaulis every second year, and top-dress them at this time with leaf-mould and road scrapings, and it is a mass of bloom in spring. Even now there are several lovely flowers showing.

G. B. Caraher.

[Gentiana acaulis will thrive in soil which would spell death to the others. The above Chinese Gentians may be propagated by cuttings taken in spring or by division of the roots in April, the latter being the method usually adopted, and the first week in April is preferred. These glorious plants revel in a deep bed consisting of light loam, leaf-mould, and peat, with a little sand, the loam forming about one-third of the whole. Potash in any
form should be avoided, even that
from the garden fire. As your land
clay, we advise you to dig out a be
depth of 15 inches and fill in with a
as near to that given above as

At the foot of a north wall, something to cling to, it grows freely very beautiful. The roots are almost al with those of Bindweed, and it els quite as freely as that pest when y situated.]

GREENHOUSE

sa not flowering

P. C. C.).—The varieties of the sa (Acacia) are very numerous, and of them bloom very sparsely at any Without knowing the variety, it is possible to suggest any treatment to result in inducing your plant to . One thing, however, is likely, and is you are feeding the plant unduly. arving it.

um capsicastrum not fruiting

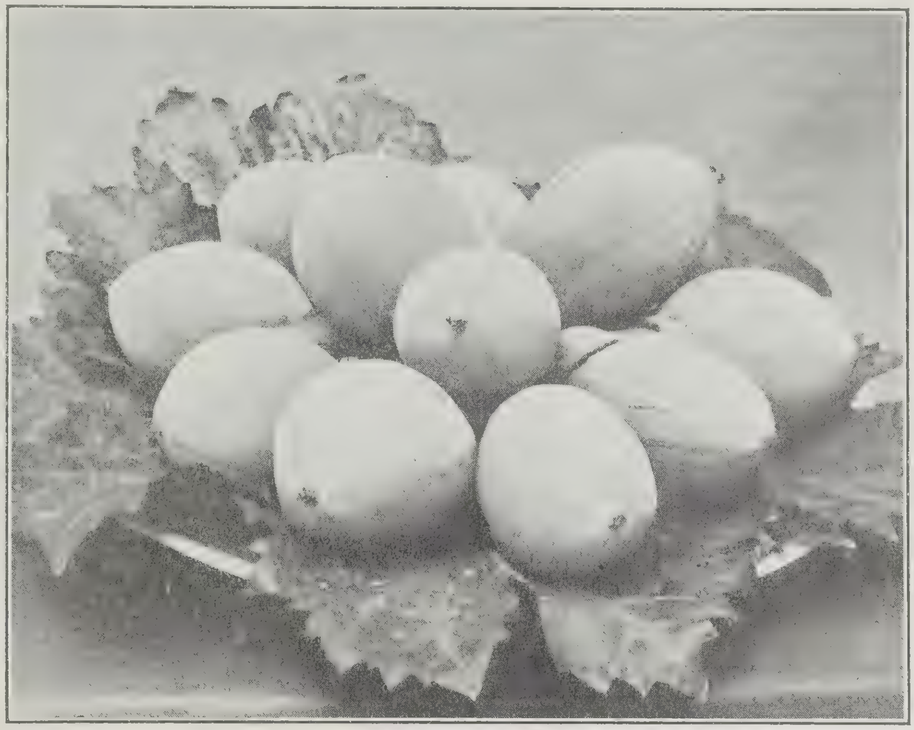
tia).—The plant arrived in good condi- nd enlightens us somewhat as to the of its not fruiting. It is a seedling and ot been stopped more than once, and we t think that you will get any berries on mainder this year. Seedling plants are fruiting, at least a large percentage of are, and that is the reason why large rs prefer cutting plants. In January bruary cut your plants back hard, or at a portion of them, and place them in a greenhouse, where, if kept on the dry they will soon break into fresh growth, le for cuttings. When these are about es long they should be taken off and in- in small pots of sharp sandy soil and under a bell-glass until rooted (several gs dibbled in around the edge of a 3- or 4-inch pot is the best method). When rooted, pot off singly and grow on in a rature of 55 degs. gradually hardening off as root action becomes free. When es or 4 inches of growth has been made should be stopped, and stopped again, a nice bushy plant has been formed. in May, the plants having been well ned, plant out in rows on a sheltered r, water freely during dry spells, and the fruits are seen to be setting freely occasional stimulants. Treated thus, hould have handsome stocky plants and of berries. The first week in October e plants with a nice ball of earth, and in a cool greenhouse or frame, shading bright sunshine if there is a tendency e part of the plants to flag. Some rs pot their plants on and plunge the up to their rims in ashes, but we prefer rmer method. In your own case the s did not come into bloom soon enough, re drawn and weakly. You might try of them in a house having a night tem- ure of 60 degs., but we are afraid you et little from them this season.

ated greenhouse which gets no sun

orge Brown).—The best use to which a house could be put would be that of ing Alpine plants, many of which would ry well in such a position during the r and early spring months, after which could be accommodated in the open and ouse used for raising seeds of various , including flowers and vegetables. Ferns would be found to succeed in a house; they must, however, be of a what hardy character, such as Adian- pedatum, Polystichum munitum, P. tichoides, P. angulare, Adiantum us-veneris, Asplenium trichomanes, pendrium vulgare crispum, and Poly- um angulare dinisolobum densum. Of es, the following should succeed:—Pyrola rotundifolia, Hepatica triloba in variety, Oxalis enneaphylla, O. magellanica, Ramondia pyrenaica, Anemone sylvestris, Hardy Cyclamen, Cypripedium pubescens, Linnæa borealis, Primula Juliæ and its various forms, Primula denticulata, P. auricula, P. pulverulenta, Sanguinaria canadensis, Mossy saxifrages, Violas, Mazus pumilis, several of the encrusted Saxifrages, Sedums, and Campanulas, such as C. pusilla, garganica hirsuta, pulla, and Fenestrallata, Calceolaria John Innes, and many other choice subjects. In the early spring, about April, seeds of most annual flowers could be raised, and also herbaceous flowers, by sowing thinly in well-drained boxes of sandy soil, and some may be pricked off and flowered in pots for use indoors. Sweet Peas and Garden Peas could be raised in pots or boxes for planting out, and some Lilies could at least be started in such a house and transferred to the open later.

Soil for Gloxinias

(M. B.).—A suitable compost for Gloxinias is two-thirds of good fibrous loam, broken up to the size of pigeon's eggs, and one-third made up of chopped leaf-mould, peat, a little bone-meal, and sand. The plants should be potted up about the end of March and stood on a shelf—near the glass for preference—in a house having a temperature of from 60 degs. to 65 degs. at night. Water for a time must be given with great care, but the pots should be syringed almost daily. Apply no stimulants until growth is strong and advanced, and grow in a slightly cooler and more airy temperature when the flowers begin to open. During growth abundance of moisture in the atmosphere is much appreciated by them. Your plants have suffered from having been grown in a temperature too low and dry, with too much water at the root, hence the surface green; a humid atmosphere is imperative during growth. Both the seedlings and any older corms you may have should be gradually dried off, sufficient moisture only being permitted to maintain the corms in a plump condition. A suitable store for them is a house or room which is just frost proof. In March shake out the corms and proceed as above.



The edible fruits of Passiflora

Passiflora edulis

COULD you say if Passiflora edulis is the plant which bears fruit known in some countries as Granadillas? A nurseryman's catalogue I have suggests that Passiflora edulis can be grown in this country on a warm wall in the milder districts. I do not suppose that the fruits would compare with those grown in sub-tropical countries, but I should be obliged for any information you might be able to give about it.

Dorset. JOHN ADAMS.

[This plant may be grown in this country on warm, sheltered walls and in favoured districts. Its fruits, however, cannot always be relied upon. The variety usually grown is Passiflora cœrulea, which produces attractive blue flowers 2 inches across from July to September, and rich orange-coloured fruits as large as egg Plums. The plant is often cut to the ground in winter, but usually springs into growth again the following year. The West Indian "Granadilla" is Passiflora quadrangularis, and although the former name is frequently applied to several species of Passiflora, the facts are as here stated.]

FRUIT

Melon for frame

(R. P. C. C.).—Hero of Lockinge is probably the easiest managed of all Melons when grown in a frame. Munro's Little Heath is also excellent.

Apple pollination

(R. Smalley).—We see no reason why Allington Pippin, Ellison's Orange, Lane's Prince Albert, and Newton Wonder should not crop well together. Golden Spire is a good variety, especially in the North of England. You should certainly plant Annie Elizabeth; it is rather slow coming into bearing condition, but it is a fine late cooking variety, and will keep until April. James Grieve is a good variety, and as you say it does well in your district, we should advise you to plant. The Beech hedge should answer for a windscreen on the western side. We think that on the eastern side it would answer your purpose if you filled up with flowering shrub. If you feel you must have a low hedge, try Berberis or Golden Privet; both could be kept to any desired height.

VEGETABLES

Keeping Celery

I have a trench of Celery which requires lifting at an early date to allow cultivation of the ground. Please advise best method of keeping till required. Would it be advisable to transplant in a convenient place and protect from severe frost? D. McL.

[A good plan is to make a ridge or bed, slightly higher in the centre, and then dig up the Celery and lay them nearly touching, but with their roots at the highest part. A layer could be laid down on each side, with the roots touching in the centre. When a layer is completed, heap 4 inches of soil over the roots and stalks, but leaving an inch or two of the leafy ends protruding. Another layer can then be laid on and also covered with soil, and so on until the whole is treated, finishing off with a good layer of soil, which should be beaten smooth with the spade so as to shed as much of the rainfall as possible. The advantage of having the roots at the highest point is to prevent water lodging in the centres of the plants and causing decay.]

Small Cauliflowers

(J. Jackson).—While autumn sowing is all well enough for providing plants for early supplies, we consider that much finer produce can be grown, if seed be sown out-of-doors early in March, the best varieties being Sutton's Favourite, Early Dwarf Erfurt, Walcheren, and Veitch's Autumn Giant. The ground should, of course, be made fairly rich, but must be well trodden down before the plants are set out. Plant firmly, allowing about 21 inches each way for the early sorts and 27 inches to 30 inches for the late varieties. Well hoe the ground at frequent intervals throughout the growing season, and should there be any sign of want of vigour about the plants, give the roots an occasional soaking of weak liquid manure. A dressing of fresh lime, at the rate of 6 ozs. per square yard, applied in spring and very lightly forked into the surface, is very beneficial to this plant.

Mushrooms

I should be glad if you could give me some directions as to the best method to start cultivating Mushrooms, quantity of spawn required, etc. I have a greenhouse 30 feet long, with border (under staging) each side 4 feet wide. What is the best time of year to begin? M. L.

[The most important requirement in the cultivation of the Mushroom is a plentiful supply of fresh horse droppings, said horses to be "hard fed." That is, on oats and hay. A quantity of fibrous loam, but not more than a sixth of the whole bulk, may be made use of by mixing thoroughly with the droppings. The fresh droppings, collected daily, should be spread out thinly in an open shed until such time as a sufficient amount has been got. The whole is then thrown into a conical heap to ferment. This should be turned and mixed every third day, and by about the tenth day the mass should be made into a bed, treading it well down, but not making it actually hard. The bed must not be less than 2½ feet thick, and should be 3½ feet to 4 feet broad. It will heat violently, or should do so. When the heat has declined to about 75 degs., "spawning" should be carried out. Break up the cakes of spawn into pieces the size of an egg. Bury the spawn 2 inches under the surface and 6 inches to 9 inches apart. In a few days the bed should be covered with 2 inches of the best fresh loam. Lay evenly all over and beat down smooth and firm with a spade. While it is possible to grow Mushrooms in a greenhouse, this is not an ideal place for this purpose, as it is hardly possible to keep a glasshouse at a steady temperature of about 55 degs., the warmth at which the Mushroom succeeds best. Also the drip from the staging would be harmful unless you had some protection provided to shed this off. Beds can be started at any time, but from September till March is when the bulk of them are made.]

BEES

Candy for bee feeding

I would be greatly obliged if you could inform me of the proper way to make "Bee Candy" for winter feeding.

"DOUBTFUL."

[The following is a simple recipe:—To 6 lbs. of the best white granulated *cane* sugar add 1 pint of hot water. Use for preference an enamelled or an aluminium pan. Stand it beside the fire, stirring occasionally until *all* the sugar is dissolved. Now add a small teaspoonful of cream of tartar. Place the pan over a brisk fire or gas ring and boil for about five minutes, then remove from fire and stand the pan in another vessel containing cold water until the liquid begins to cloud over. Directly cloudiness appears stir vigorously. When the syrup has so thickened that further stirring is impossible, it should at once be transferred into some suitable receptacles. Bottomless boxes with glass lids, such as section cases, glazed on one side are very suitable. The glass enables the bee-keeper to see when the candy is consumed without disturbing the bees. When the candy is set it should be a moist, solid mass, easily cut into with the finger nail. If the candy is too hard the bees will be unable to make use of it without leaving the hive to obtain water; if too soft there is the risk, with the heat rising from the bees, of the candy running down between the combs and smothering many of the inmates. Failures in making good candy are often the result of (1) the sugar not thoroughly dissolved before starting to boil up; (2) over boiling; (3) stirring the syrup before it has cooled down sufficiently. In making candy it is advisable to keep the pan covered during the actual boiling, the confined steam will then melt any particle of undissolved sugar that may be adhering to the side of the pan. A few undissolved crystals will often cause the whole mass to crystallise during the stirring process. Should this happen the candy must be re-boiled for five minutes with another pint of hot water. A special candy-making thermometer is made which marks on the scale the exact temperature to which the boiling syrup should rise, with a lower mark showing the temperature at which stirring should commence. This thermometer can be obtained from the office of the "British Bee Journal," 23, Bedford Street, Strand, W.C., price 5s. 3d. Though candy feeding during the winter months may be necessary to save the life of a colony, the correct time to feed bees is during September, when sufficient liquid food should be given to last the colony until the honey flow commences in April.—L. BIGG-WITHER.]

LEGAL POINT

Legal status of park superintendent

(a) What is the legal status of a park superintendent as to notice to quit in face of the fact of no agreement on that point when engaged? (b) Is a park superintendent liable to pay unemployment insurance? SUTTON'S SEEDS are recognised wherever Flowers and Vegetables are grown as

THE BEST THE WORLD CAN PRODUCE

Is there room for any but the best in your garden? Remember that the best seeds cost but little more than poor, worthless stocks.

A copy of Sutton's New Garden Seed Catalogue of Flowers, Vegetables, Seed Potatoes, Lawn Grass Seed, Fertilisers and Garden Sundries will be forwarded to you free on request.

How do you buy
your BONEMEAL?

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bonemeal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

A free sample will convince you. Write for it to-day.

FLOWER GIFTS ACROSS THE WORLD

A presentation basket of flowers by Thomas Tiffen and Co.

*To walk into a florist's shop, select
pay for your flowers, and know that w
a round of the clock a replica of
flowers chosen will be delivered as
gift to a friend in America or
Antipodes, is surely one of the ma
of modern commercial enterprise, a
service that deserves to be extended
on the same important scale as ob
in America*

THE organisation which has so h
facilitated the charming custo
" saying it with flowers " by wir
where and at any time with its flower
service is the Florists' Telegraph D
Association, whose members n
thousands in all parts of the world,
many hundreds of units in this countr

No gift is quite so intimate nor exp
so well the sentiment of the giver as a
one. The flowers themselves transmu
greetings into poetry with a delicacy
guage and feeling that is denied to us
other form. They presuppose a frie
that is beyond cash values, and a per
of understanding between giver and reci
they are Remembrance's sweetest epito

Until some genius conceived the idea
F. T. D., not only did those who had t
and send their blooms a few hundred
do so with dread of the condition
flowers when received, and with uncer
of their arrival at the proper time, but
whose friends were further afield had
miss the notion as being impractical
just could not be done. Now it has
proved possible to enter a London florist
have your flowers delivered within the
to a friend in New York. The proced
now simply this. You visit any local
who is exhibiting the association's sign
accompanying slogan " Say it with Flo
give him details of the gift required a
greeting that you wish to go with it
address and at the time specified. The
then selects from his register the m
domiciled at the nearest point to your fr
address, and sends to him your order a
structions. All final adjustments of rem
ation for goods and service are effect
the association without trouble to the s
or receiver. The Mercury emblem
florist's establishment denotes him
bonded member of the F. T. D. A., and
member feels that he is in honour bou
co-operate with every other member i
irreproachable execution of the order
trusted to him. He recognises that it
primary obligation on his part not to
the link and let the association down.

Although the activities of this exc
service are necessarily expedited at the C
mas season, its facilities may be ultilis
all other occasions and celebrations for
flower gifts are appropriate. The
voyage " gift is very much in vogue a
those who want to ensure that a gi
flowers will arrive on board at the mo
of their friend's departure overseas. It is
possible to arrange for similar gifts
membrance at every port of call and a
port of destination. The convenience o
service is widely appreciated also for i

Cypripediums and Lilies of the Valley

so not only oils the wheels of business, but contributes materially towards lessening causes of friction that endanger international amity and goodwill. The time may not be far distant when the system is applied to general nursery stock, enabling us to instal within our friend's domain, and he within ours, little gardens of remembrance where, say, the Roses, Irises, or Lilies of our mutual adoration shall be tended and shine as living memorials of friendship. It is to be hoped that this very desirable consummation, the logical sequence of the present service, will come soon. The way is thorny, but the phenomenal success of this Flower Service indicates that the many difficulties will be smoothed out and that the realm of flowers ultimately will be without frontiers commercially as it has always been æsthetically. In the meantime, its benefits may be enjoyed by us all, and nothing but good for all concerned can spring from the habit of sending flower gifts across the world. A. J. G.

Christmas Plants

HEN the celebration of the Winter
Solstice, the re-birth of the sun, was
absorbed into the festival of a later
ty, the Holly, Ivy, and Mistletoe had
taken over by the new religion. But
were not very warmly received. Mistle-
o which a very pale tradition of the old
nalia clings persistently, is still excluded
the church decorations, while even the
ly Ivy and Holly were only reluctantly
ted, and you cannot help feeling that
three old pagan plants have never been
converted. They hold their place with
tain northern stubbornness,
erhaps because they are
ble to set some dark chord
ncestral memory faintly
ng.

MISTLETOE

ny told us that the Druids
to cut Mistletoe reverently
the Oak trees with a golden
, though you would need to
h the length and breadth of
and now-a-days to find a
e Oak tree with Mistletoe
ing on it. But the Druids
been rather overworked in
ause of romance, and, on
ther hand, the Mistletoe is
a strange plant that it needs
of the little glamour they
lend to enhance its impres-
of mystery. In its uniform
of yellowish-green it looks
like a tangled sea plant set
dim pearls than a land
ler with respectable rela-
, among whom, by the way,
hall find the Indian Sandal
d. Yet it is quite easy to
if you have patience; first
ait until the seeds are quite
in February, and then to
a year or two while the germinating
allows itself to be buried by the over-
ing bark of its host. The seeds should
wn by sticking them with their own glue
the underside of a young shoot of an
e, Hawthorn, Poplar, or Rowan tree, to
h they will do no perceptible harm, for,
ugh the Mistletoe is properly classed
parasite, it is partly self-supporting. An
more desirable plant, if we could get
of it, would be the Mistletoe with red
rs and orange berries, which grows on
Holm Oaks in Italy, and was probably
"Golden Bough" which served Æneas
passport to the lower world.

HOLLY AND IVY

lly and Ivy seem to have been associated
e old winter festival, for we find them
d together in several mediæval songs.
following one was jotted down in his commonplace book at the end of the fifteenth century by Richard Hill, a grocer's assistant:—

Holly stood in the Halle
  Fayre to behold;
Ivy stood without the dore,
  She is full sore a-cold.

Nay, Ivy, nay.
  It shal not be, I-wis;
Let Holly have the maistry
  As the manner is.

The front garden of an old Kent farmhouse

The trailing Rockspray (Cotoneaster horizontalis) and the Japanese Quince (Cydonia) are growing over the low wall to the left of the steps, and Pyracantha Lælandii, with orange-scarlet berries, is trained up the front of the house

Holly and his merrie men
  They dauncen and sing;
Ivy and her maidenis
  They weepen and wring.

Nay, Ivy, nay, etc.

and the swing and stamp of the rhythm suggest that it was part of a singing game, which was probably played with a troop of boys on one side and a troop of girls on the other, for in the eighteenth century it was a custom in certain Kentish villages for the girls to burn a "Holly Boy" stolen from the boys, while the boys burnt an "Ivy Girl" stolen from the girls. Another song of this kind, with rather a charming lilt to it, is included by Chambers and Sidgwick in their "Early English Lyrics":—.

Holver and Hivy made a great party
  Who should have the maistrie
  In landis where they go.

Then spake Holver "I am freece and jolly;
  I will have the maistrie
  In landis where we go."

Then spake Hivy, "I am loud and proud;
  I will have the maistrie
  In landis where we go."

Then spake Holver, and sat him down on
    knee,
  "I pray thee, jentil Hivy,
  Say me no vilanie
  In landis where we go."

THE GLASTONBURY THORN

Another Christmas plant, which is much less familiar than Ivy, Holly, and Mistletoe, but far more Christian, is the Glastonbury Thorn. According to legend this sprang from the staff of Joseph of Arimathea, which he thrust into the ground one Christmas day at Glastonbury, after an unavailing sermon in the course of his campaign in the West against "the Druids and their Ægiptian learning." In the sixteenth century the historical bush was still growing at Glastonbury Abbey and drawing crowds of pilgrims by flowering on Christmas day. Slips of it were distributed to neighbouring monasteries and found their way into private gardens, where their descendants may be found to-day, flowering a little less punctually than of old, but giving us a few blossoms at intervals throughout the winter, and occasionally a regular show in the mild weather of our modern, earlier Christmas day. In the outcry against the reformation of the calendar an appeal was made to the Glastonbury Thorn to decide the righteousness or unrighteousness of the change, and a bush in a certain churchyard was carefully watched to see whether it would flower on the old Christmas day or the new. But, after the manner of oracles when pressed for a decision, the Glastonbury Thorn refused to commit itself, and began to flower before the new Christmas and continued till the old Christmas day was past.

Botanically this Thorn is only a variety of the Common Hawthorn, in which the peculiarity of flowering twice a year has become fixed. But whether it sprang from the staff of "Joseph Abarimacie" or from a piece of the crown of thorns that he brought with him from Palestine, or whether it appeared, shall we say "spontaneously," at Glastonbury Abbey, it is an ancient plant and well worth a place "in the gardens of the curious."

JASON HILL.

Christmas Greetings

We have added many new readers recently, and our post-bag increases at such an alarming rate that we have difficulty in keeping pace with correspondence. These are lively and healthy signs, imparting a feeling of seasonable optimism for the future. To our many friends at home and abroad, and to the wide and ever-increasing circle of readers unknown to us, but who, we are proud to think, are our friends, we take this opportunity of expressing cordial greetings for Christmas and sincere wishes for happiness and prosperity in the New Year.

The Alpine Garden Society

The proposed Rock Garden Society is now formed, with the title of The Alpine Garden Society. There was a good attendance at the inaugural meeting, held at the New Hall of the Royal Horticultural Society on December 10th. Sir William Lawrence was elected President; Mr. Selwyn Duruz, Le Chalet, Montagu Gardens, Wallington, will be the Hon. Secretary; Mr. F. H. Fisher (Chester) will be the Assistant Secretary for the North of England, and it is hoped to appoint an Assistant Secretary for Scotland. The annual subscription, 10s. 6d., should be sent to Dr. Giuseppi, Hon. Treasurer, Trevose, Felixstowe, and the life membership has been fixed at 10 guineas. The following have consented to serve on the Committee :—Mr. G. P. Baker, Mr. George Yeld, Dr. Giuseppi, Mr. Renton, Mr. Amos Perry, Capt. Symons-Jeune, Mr. W. E. Th. Ingwersen, Mr. Herbert Cowley, Miss Victoria Slade, Mr. F. H. Fisher, Mr. Clarence Elliott, Viscountess Byng of Vimy, Mr. Maurice Pritchard, Mr. F. C. Puddle, Mr. J. R. Pulham, Mr. G. Reuthe, and Mr. Edwards.

It was decided to hold the first show of this Society on May 8th and 9th, 1930, and to organise other exhibits throughout the season. The appointment of an Editor is under consideration, and it is hoped to publish pamphlets written by experts on different genera, *i.e.*, Alpine Violas, Dianthus, sections of Saxifrages, Campanulas, Ramondias, Primulas and the like at intervals of not more than two months.

NOTES OF THE WEEK

The Garden Club

We hear that Dr. Giuseppi is lecturing before the Garden Club on his recent plant hunting expedition on Olympus. The lecture takes place on March 11th, 1930, after a garden dinner, which is one of the features of this exclusive Mayfair club.

Wild flower protection

A Society has been formed which aims at the preservation of our existing British flora. It is hoped by education and legislative action to prevent the plundering of the countryside. The scheduling of our rarer wild flowers and herbs against destruction (in the same manner as wild birds are scheduled) is not an impossible task. An inaugural meeting is to be held in London early in the New Year, and full particulars may be had from the Hon. Secretary, Cyril Harding, Sunnyside, Lenham Heath, Kent.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Erinacea pungens or the Hedgehog Broom

THE rather formidable name of this plant is by no means inappropriate, for the plant is dwarf, much branched, and the tips of the branchlets are stiff and spiny. Like many of the other shrubby Leguminosæ, the small leaves on the new growth soon fall off, leaving the bare green stems on which the handsome blue flowers are borne in twos and threes. The flower-stalk is very short, and the calyces are curiously inflated, much in the same way as the Anthyllis. Older plants grown under glass produce a certain amount of seed annually, but the hedgehog character of the plant is soon manifest when any attempt to collect seed or to remove dead flowers is made. The seed pod is short and contains only one or two seeds; these germinate readily if sown at once. The seedlings grow slowly, attaining about 5 inches in height and 10 inches in width in four years, when they commence to bloom. If planted on the rock garden a well-drained, sunny position should be chosen; if sheltered from heavy rains by an overhanging rock, so much the better.

The plant can also be propagated by cuttings. Growth is slow, and an annual potting will be found sufficient; the soil should consist of three parts loam, the other quarter consisting equally of lime rubble, sand, and leaf-mould. Pot firmly. Careful watering and free ventilation are essential. The vogue of the Alpine house will probably make its cultivation more common than in the past, as it is an ideal plant for that structure. An old plant, which once gained a "Cultural Commendation" has flourished for over 20 years in a cool house and still bears a plentiful crop of flowers each season. In the open it appears to miss the sunny, dry climate of Spain, for although introduced in 17
still somewhat rare in private garden

Handcross. J. Co

The Hedgehog Broom (Erinacea pungens). A prickly subject with bluish-purpl Pea-shaped flowers ; native of the dry hills of Spain

The fine specimen here figured is nearly a yard across and flowers in great profusion as pot plant in Lt.-Col. Messel's garden at Handcross, for which his gardener, Mr. J. Comber received a Cultural Commendation from the Royal Horticultural Society

Wanted: A Society for the prote of rare British plants

Whilst one can warmly sympathis
Mr. Herbert Cowley in his condemna
the removal of 18 plants of the
Gentian from a wild part of Surrey
more difficult to appreciate his point
when dealing with the objects of the r
formed Society for the Protection o
Flowers. The normal gatherer o
flowers gathers indiscriminately, and
with a disregard of results to the pla
endeavouring to influence young peo
the direction of sparing and careful ga
ing, and the avoidance of removing roots
Society seems to be starting in the right
The need for gathering wild flowers in
way is a real one. I reside just outside
London area, yet within three to four
of where this is being written Primroses,
Early Purple, the Fly, and the Green Wi
Orchids have almost disappeared.
Spotted, the Pyramidal, and the Bee Orc
show unmistakable signs of the annual
and broad sheets of rich hued Bluebells
been reduced to weakly patches of stu
growth and poor colour. All this has occu
within the past 20 years, yet most of
damage could have been avoided by cut
or the careful breaking of flower stems.

Now to return to the 18-plant man.
the true value of his native flora been
plained to him early in life he would p
ably have realised that seed from one of
plants he so selfishly lifted was capable
giving him greater interest in raising it,
a far better chance of establishing the pl
in his garden. Moreover, there would

re plants to gladden the eyes of those njoy its beauties on that wild piece of Common. A. M. SWAIN.

I am interested to see the note about arsh Gentian.

t spring a woman dug up all the spring n she could find in, I believe, Middlende.

It very difficult to know what to do, as oes not want to stop children picking s, and yet the Primroses have gone all our roadsides here in my lifetime, ritillaries have entirely vanished, and things are getting scarcer.

m having cards printed somewhat on lines :—

Are you a motorist?
Then spare the wild flowers.

ase do not dig up the roots.

ve them for others to enjoy as well as

ase pick few or soon we shall have none

mroses and Cowslips are getting very e in many counties.

emone and Bluebell woods are getting er. These flowers fade before you get

ld Daffodils and Fritillaries are nearly out.

sque Flowers and Marsh and Spring ian are so scarce they should not be d at all.

ggestions from others *re* other flowers want protecting would be welcome.

HARRY PEACH,
Hon. Secretary to the Council
for the Preservation of Rural
England Exhibition Committee.
St. Nicholas Street, Leicester.

—"One must exaggerate nothing," as the ch say, and the cutting of our commonvild flowers by the town dwellers is not g to exterminate them, but the uprooting em must inevitably do so in time. So s all join in asking everybody to leave oots of plants in peace

ur rarer floral treasures are not immune danger, they fall an easy prey to the strians and climbers who, smitten with charms, cut or uproot these gems to themselves a transient pleasure, little ing that by so doing they are endangerthe existence of a rarity.

is difficult to cope with such conduct, which, since it arises from ignorance, e is some excuse. There are, however, se offenders, though their numbers being r their power of destruction is less.

hese are the self-styled botanists and sod flower-lovers, who hunt for rare plants ematically, and gather and uproot them lessly on purpose to dry them as botanispecimens, or to plant them in their own lens under the impression that the scientiknowledge which they possess excuses vandalism.

urely such people should be summarily lt with like those who cage our song birds ll treat animals.

o bring home to all reckless destroyers of tish flora the error of their ways a society ed Flora's League has been formed. Its ge costs one shilling. There is no subption. The following are the rules which members themselves observe and try to others to follow also :—

. Enjoy flowers as they grow.
. Gather sparingly.
. Pluck carefully.
. Allow them to seed freely.

he badges and literature of Flora's gue can be obtained from its founder, Sir Maurice Abbott Anderson, Madeira Cottage, The Walk, Lyme Regis, Dorset.

To keep the earth in touch with Heaven,
The flowers—God's Thoughts—to it are
given! VICTORIA SLADE.

Eritrichium argenteum and E. nanum

I WISH to express my appreciation to Mr. Roger Bevan for his excellent cultural directions for Eritrichium nanum. Eritrichium argenteum will probably be amenable to the same treatment if limestone is substituted for granite chips. This plant, classed by Farrer as a form of E. nanum, differs at least in one important particular from the latter; it is always found on limestone, never, to my knowledge, on granite or schist. E. nanum apparently has precisely the opposite preferences. It may be of interest to your readers to see a portrait of this lovely plant. It grows between 12,000 feet and 13,000 feet, usually on steep, rocky slopes, forming little tuffets of silvery down. The flowers are small and pure deep blue. The illustration is about two-thirds natural size, but the plant is, unfortunately, almost out of bloom. The flowering season of E. argenteum is in July, while I reach the mountains at the beginning of August and see only the remnants of a glory that has passed.

Allow me to note that in M. Correvon's letter on page 752 the word "rootlet" is a misprint for nutlet. LOUIS BRAND.

University of Cincinnati.

Thoughts for the birds

And when you have finished decorating the house—when even the kitchen has been given its bright adornments—why not take a piece of string two or three yards long and tie upon it here and there pieces of Coconut, lumps of fat, Raisins, and half-shelled Brazil nuts. Festoon this from tree to tree or from one tall stick to another in the garden and the birds, particularly the tits, will make a living decoration outside your window during the whole of Christmastide. (From "Flower and Vase: A monthly key to room decoration," by Anne Lamplugh.)

——So many fail to realise how helpful birds are in ridding the soil of pests. As soon as the crops have been gathered in the ground should be dug over, leaving the surface quite rough. The grower should get this done before the hibernating insects have gone down any great depth, when a great number of them will be brought to the surface and devoured by birds. If the surface spit of soil is turned over several times during the winter the cleaner it will become by next spring, and the pests not eaten by the birds will fall victims to frost as the cold weather arrives.

Another thing must not be lost sight of, that weeds are also attacked as well as cultivated plants. Therefore, well weed the land, for if allowed to remain they may be feeding the pests. It will thus be seen it is advisable to keep weeds in check, either by burying them very deeply or destroying them by burning. F. H.

Euphorbia palustris

Several articles have appeared in GARDENING ILLUSTRATED recently about autumn colouring, but these have all related to shrubs and trees, and nothing has been written about the colouring of leaves of stems of plants in the Herbaceous border. Almost by chance I discovered recently that such a plant, easily grown, but seldom seen, possesses a most remarkable beauty of colour in autumn, which may rival anything of the kind amongst shrubs. I refer to Euphorbia palustris, one of the Spurge—or Milkworts. Like all members of the Euphorbia Family, the flowers have a greenish-yellow hue, and these are remarkable in the spring by reason of their large size and the wealth of blossom. The plant dies right down in the winter and starts away early in the spring and attains a height of 4 feet in about six weeks. After the flowers are over, the stems continue to grow and carry pinnate leaves of a light green colour. The real wonder of the plant is not revealed until the autumn. I mentioned that I discovered this by chance. In previous years I had cut down the stems in late summer, but this season they were left; as the leaves were falling the light green stems changed to a light pink, then to rose colour, and finally, when the stems were bare, they became a bright red. A remarkable feature of the colouring is that on the side towards the south the stems colour more deeply than those on the east and west, while the side towards the north remains light green. The effect of these various hues on the one plant seen in sunlight is very beautiful, and must be seen to be realised. Although I have many trees and shrubs in my garden grown entirely for their autumn colouring, there is not one that can rival the beauty of Euphorbia palustris.

Plant in late autumn or spring, when it may also be increased by division; give the same good treatment as to any other plant in the herbaceous border. It is thoroughly hardy. F. H. S.

Herts.

Gardening enthusiasts

"ROVER," an old hand at the nursery, and known as the foreman, brings home the GARDENING ILLUSTRATED every week.

He now considers that "Mush," the Persian kitten, a new arrival, should also be trained to become interested in reading each week's best gardening news.

An Evening with Kingdon Ward

A fairyland of epiphytic Rhododendrons and Blue Poppies

Tuesday evening (December 10th)
pt. Kingdon Ward was the guest of
Horticultural Club, and after dinner
ed a large audience with an account
recent journey in Asia. The region
was along the Assam frontier be-
Assam and Thibet, through climates
g from tropical to arctic. The lecture
lustrated by a most interesting series
tern slides depicting natives, scenery,
lants of special interest in this little-
corner of Asia. The primitive
key rope " and Bamboo bridges over
and torrents looked very insecure. One
in the form of a tunnel made of rings
mboo canes had taken years to con-
though it was cut down in a few
ls after crossing by a runaway follow-
trivial domestic dispute. The jungle
y is sparsely populated, and villages
riodically wiped out by famine. The
e coincides with the periodic flowering
Bamboos, which brings swarms of
the jungle that later consume all the
of the natives.

narkably fine pictures were shown
iphytic Rhododendrons, including R.
ocolum on a tree over a river. R.
vorthii was also shown growing on
trees. Many Rhododendrons are
ytic in this region. It is curious to see
perched high on forest trees—it is only
the branches reach the light that they
r to flower at their best.

tures in their native habitats were

Primula (Omphalogramma) Soulei.
rence was also made to the much dis-
d Blue Poppy, Meconopsis Baileyi syn.
etonicifolia. In gardens this plant is not
ys pure sky-blue, and it certainly shows
rked tendency to produce more petals
we expect from a well-behaved member
e Poppy Family. Capt. Kingdon Ward
ed his audience that in Nature it was
ys pure clear blue and invariably four-
led. His remark that in cultivation it
have become entangled in morganatic
iage and " the nearer Heaven it is grown
earer are the flowers to pure blue " did
we think, bring consolation to those who
lained of the many-petalled, dingy puce
muddy purple hues attributed to this
e jade. Be that as it may, is it not
ble that soil and situation influence the
r of this Poppy? Of this we are quite
that Meconopsis Baileyi at its best is
of the treasures of an English garden,
one of the most lovely of all the plants
ecent introduction. H. C.

imula Eucyclia (K.W. 6,822)

is delightful Primula has an elfin charm
wer and form that makes an irresistible
al to all who meet with it.

e plant is of slightly spreading habit,
ing a small hillock of thin, wiry growths
ches high, the round, five-lobed, deeply
hed leaves of a pleasing chrome-green
covered with short soft hairs. The flowers
ar singly or in pairs, borne stiffly erect
-inch stems, are of a soft rosy-pink with
early defined yellow ring in the centre,
le the petals have a deeply cut margin,
ng a fringe-like effect that enhances the
ant appearance of these flowers that may
be likened to a pink flattened-out
lanella minima.

It is, however, the attractive autumn-tinted foliage that has called for this note, for at this time admirably blended colours of red, purple, and gold in the older, combining with the soft green of younger leaves form an effective picture most rare among Primulas.

This plant is ideal for the Alpine house and responds to good culture in a compost of two parts broken fibrous loam, three parts leaf-mould, to one part broken sandstone and sharp sand. A light potting is to be recommended; ample water and shade through the summer months is essential for its welfare. Cuttings taken in late June form the best means of propagation. These should be inserted in clean sand and placed in a cold house, preferably under a bell-glass, while " Irishman's Cuttings " may be taken of the stolon-like shoots that run over the surface of the soil emitting roots as they advance. These however, do not seem to make plants so quickly as the real cuttings.

The apparently amiable nature and rapid means of raising stock should soon place this rare charming Primula within reach of all.

J. T. Wall.

Lewisias

Lewisias are not grown nearly so extensively as their value for the rock garden or Alpine house merits. This is no doubt due largely to cultural errors when frequent losses occur, and their shyness in setting seeds wherewith to replenish the stock.

It may not be generally known that the offsets (of such species that make them) of Lewisias root readily with a little care.

The rosettes should be cleanly severed from the parent plant with a sharp knife. If this is done carefully no further trimming is necessary. Insert the cuttings in clean, well crocked pots filled with sharp moist sand, make firm, keeping the rosette well down. The pots should then be watered and placed in a cold house under a bell-glass. Care must be taken not to over-water, as, being rather succulent, they are very apt to damp out; the one watering should suffice until they are rooted. September is the best time to insert the cuttings, and they will be ready to pot off in about four weeks.

Lewisias in the garden are best grown vertically in an open position facing west or south-west. Use a good loam in which a few pieces of old mortar rubble has been incorporated. For the Alpine house a little decayed leaf-mould and coarse sand should be added to the soil. W.

December jottings from Nice

DAHLIA IMPERIALIS has been unusually beautiful this genial and sunny autumn, reaching the unusual height of 10 feet with its crown of pendant Lily-like blossoms, and continuing in beauty the whole month of November. December began with warm rain, which was needed in the garden, but the moist air is scented by the fragrant sprays of Buddleia auriculata and the fine form of Chimonanthus which pervades the whole garden, so that visitors ask where all the sweet smells come from, not realising that the big bush (near an Orange tree) with sprays thick with leaves has its flowers hidden by the still abundant foliage. Yuccas are in especial beauty this month; they bloom twice a year, and since I learnt from a travelled American friend that in Texas they use the young flower-spikes, eating them like giant Asparagus, my autumn crop is much increased, as I mercilessly cut and eat the young flower shoots before I leave my garden in May. So good are they that I think of devoting a wild bank to their culture, as they are useful as well as ornamental, and require no care after being once established.

Acacia podalyriæfolia burst into fine flower with the first rains, and I see Snowdrops and Crocuses of various sorts asserting themselves. Hakea eucalyptoides is another beautiful December flower, though it more often chooses to open in November. Last winter tried this fine bold shrub severely, but it has recovered fully. Lantana elegantissima also is in much beauty, which will last till Kennedya Comptoniana takes up the same lovely shade of colour. Will this season allow us to enjoy the Bougainvillea's rich purple or red sprays? After last winter one looks askance at the bold spikes of the true Aloes that are now fruiting on sunny banks. In many places they were entirely destroyed, but the long hot summer seems to have made those that are left even fuller of flower than ever, so hope springs anew in the gardener's breast.

How many Salvias are in flower? It is difficult to give them all their correct name—who and where is the final authority? French gardeners are wedded to their own names. There is one I frankly do not know, with bold, upright growths and broad foliage crowned by long spikes of red flowers with brown woolly calyxes, but it does not make branches readily. This season, however, it is really beautiful because it was cut to the ground last winter, a thing that must be repeated. The straggling semi-scandent Salvia chamædrifolia is another special beauty, with brown woolly calyx and lavender blooms with a rich purple lip, most attractive. It begins when the good old Salvia eriocalyx comes to an end in December, but it is happiest when tied to a Palm trunk or scrambling through an Orange tree, where it contrasts so prettily with the fruit. Lopezia miniata is another pretty straggler against a wall, where its dainty sprays recall the autumn beauty of a flowering Heather that has blushed pink. Mina lobata, with its scorpioid racemes of cream bells shading to crimson bracts, is very decorative just now, scrambling up from its hole into a late Arbutus bush; one wishes it were more amenable to English conditions. Erica multiflora is also very full of flower and a great delight when found growing wild on

Farrer's Gentian with 103 blooms

Mrs. J. Raymond sends a photograph from which the above illustration is prepared. It shows a plant of Gentiana Farreri in her open rock garden which has had 103 blooms on it this autumn some wooded hillside. It is one of the puzzles of gardening to find that where it grows freely you will not find the fragrant Myrtle.

EDWARD H. WOODALL.

Cytisus præcox

THIS fine hybrid Broom is a splendid subject for growing in groups and masses. Treated in this manner it is exceedingly effective when in bloom. It has a distinct graceful, and bushy habit, ultimately reaching a height of about 5 feet. The flowers are produced in great profusion along the slender shoots in April and May of a sulphur-yellow colour. Known also as the Warminster Broom, on account of its having had its origin at the latter place. Unfortunately, the flowers are possessed of an unpleasant odour, which detracts somewhat from its usefulness for planting near to dwellings. On the other hand, it is a most pleasing sight when in full bloom viewed from a distance.

The illustration shows one of several groups that were originally planted on the edge of a plantation of trees and shrubs.

The Warminster Broom (Cytisus præcox)

Looking after Fuchsias in winter

More Fuchsias are lost during winter than at any other time of the year, not because of frost so much as through plants being put away in some out-of-the-way corner and forgotten. When greenhouses are filled to their utmost capacity with plants in bloom and coming into flower, Fuchsias often have to take their chance, and not infrequently they are packed close together under the greenhouse stage in semi-darkness, where, being near heat pipes, they either get dried up or are subject to drips from plants above. During winter these showy summer-flowering plants ought to be given a rest, and, for this purpose, coolness is essential, the best place, of course, being a cool house, away from actual frost, or in a spare room or shed where light can reach them. It is very desirable in the case of standards that every care should be given them at this time of the year. The aim should, therefore, be not to hurry plants unduly, but to keep them just going, so that by the time February comes round when they can be cut back and repotted, and then given a little extra warmth, they will jump into growth. It is not much that Fuchsias ask now, but the extra care one can give them is well worth it.

W. F.

The Holly bough with berries red

" And these who on this social eve,
Its old observances with joy fulfil;
Their simple hearts the loss of such would grieve,
For childhood's early memory keeps them still,
And therefore do they deck their walls with green;
There shines the Holly bough with berries red."

There can be but little doubt that the decoration of our dwellings at Christmastide is simply carrying on the Ancient Roman custom of decking their buildings with green boughs during the Saturnalia, and in the curious astrological and botanical works the Holly is dedicated to Saturn.

In many of the old herbals the Holly is called the Holy Tree, and it certainly appears likely that our name is a corruption of this one that is far older. In Denmark, Sweden, and Germany the Holly is always termed Christ's Thorn, or the Christdorn. The bright red berries have been likened to drops of blood, just as the Mistletoe berries have been likened to drops of sweat. From its association with the religious practices of the Druids the last-named plant is never to be found in the decoration of Christian places of worship, and it is curious that the Holly is not under the same ecclesiastical ban. It is as frequently used in them as in our homes, and the early church seems to have permitted its use for decoration, as it was no longer regarded as dedicated to Saturn, but an emblem of Christ with its thorny leaves and scarlet berries.

It is a remarkable feature of these leaves that when seen on the upper shoots they have a more simple outline and are devoid of their characteristic spines. This even outline of the leaves on the more exposed shoots no doubt allows the winter snows to slip from them more easily, and their smoothness is beneficial for the same reason. In more sheltered positions within the reach of browsing beasts that might be tempted to devour their shiny green leaves when green food is scarce, the spiny character must preserve them from injury and also protect the younger defenceless ones near them. The Holly is certainly one of
the finest evergreens we have for the
tion of our gardens, especially in the
months. The so-called Hedgehog H
a real curiosity, as the spines are to be

Nierembergia rivularis

In the lovely Nierembergia rivulari
have one of the many plants about wh
is difficult to say whether it will bloom i
particular garden or not. It is well er
known among growers of experience tha
plant may succeed in one garden and f
another which appears to offer similar
tions. In nature this native of the Arge
covers great spaces by the banks of th
Plata with its leaves and dazzling
flowers of the purest beauty, and in
gardens in this country we may meet
large plants spreading freely and flow
bravely. In others the greatest care ma
even be rewarded by miserable little p
and a few flowers. Without attemptir
dogmatise upon the subject, I am of op
that the question of summer moisture e
largely into the factors for or against
cess. I first formed this opinion after t
N. rivularis in a dry garden with a sand
and gravel below. Even with plenty of
applied, the results were not at all com
surate with the work involved. On vis
the garden of a friend I saw there mag
cent, large plants of the Nierembergi
perfect mass of bloom. My friend infor
me that he could not succeed with it in
rock garden or border, so he was grov
it in large pans set in pails with the w
just over the bottom of the pan so that
roots of the Nierembergia were always
to reach the water. In autumn the
were taken out of the pails and wint
nearly dry in frames. It is not everyone
would care to cultivate this plant in
manner, or who could spare the time to
tend to it, but the experience may give
to some ideas by which such a trial c
be modified with success. It would app
that underground water, plenty of sun,
an open soil are important factors in gr
ing this gem. I see that Farrer, who d
not minimise in the least the troubles wh
await so many would-be growers of N. ri
laris, suggests a gentle, sunny slope of
rich but light and open loam, well-wate
from beneath. In very sunny gardens
thinks the slope might be away from
southern sun, but personally I consider t
N. rivularis delights in sun.

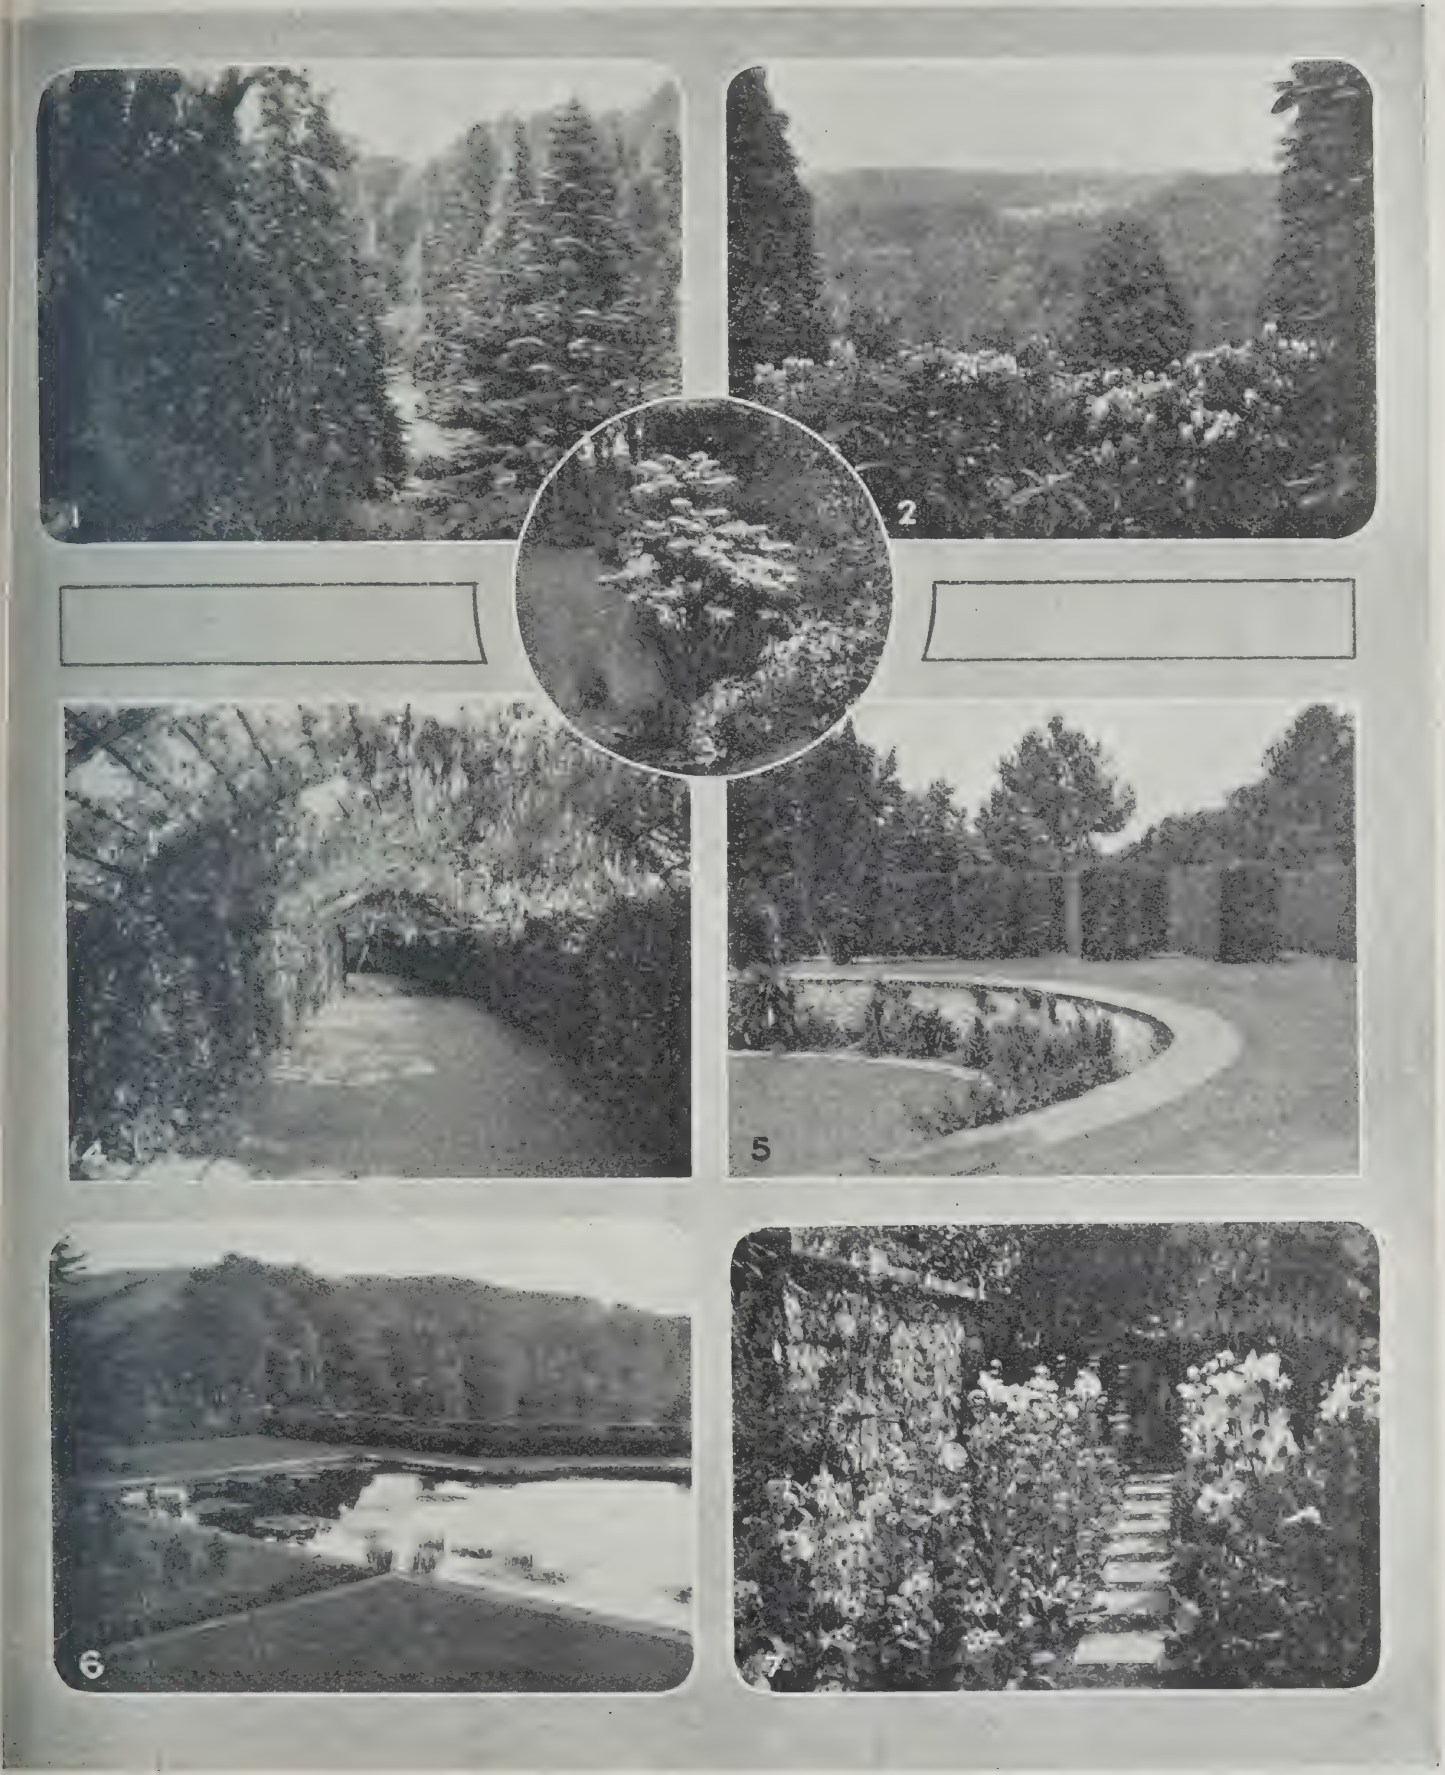
BODNANT GARDENS, NORTH WALES



1. Conifers in the Dell.
2. Bodnant from the far side of the Dell.
3. Viburnum tomentosum var. Mariesii.
4. The arched walk of Laburnum.
5. Yew hedges on the stage of the Canal Terrace.
6. The Water Lily Terrace.
7. Meconopsis Baileyi and Primulas in a sheltered spot.

The Mistletoe Bough

THERE is so much to be learned about the cultivation of the inhabitants of the garden that there is seldom much time to devote to the study of other aspects of them. The festive season gives us a few hours to follow up this interesting pursuit. There is no need to think about any plants other than those conspicuous at the moment, for to unravel the history, legendary or otherwise, of the Mistletoe can make hours of study and the perusal of many books.

Viscum album, the Common Mistletoe, is sometimes erroneously stated to be the only European species of the order Loranthaceæ. True, maybe, that no other kind can be found in Britain. But Loranthus europeus is quite common in Southern Europe, where it grows freely upon Oaks and Chestnuts. The leaves of this species are very similar to our Mistletoe, but there is a difference in that Loranthus europeus is deciduous. Again, the berries of this kind are yellow as against the white viscid fruit with which we are familiar.

Mythologists apparently have cause to doubt whether the Common Mistletoe is the original in the famous legends, including that of Balder the Beautiful. One of the chief points concerned is that the Mistletoe only attains its importance when found on the Oak. As already stated, Loranthus europeus chooses the Oak quite often in the countries where it flourishes, but we all know how seldom Viscum album is to be found on the Oak in Britain. Religious worship always favours the rare. There is no doubt that is why the shrub that never touched the ground was held up to so much reverential esteem. Continuing the thought that religion prefers the rarity, it is quite possible that our Mistletoe was, after all, the right one when it was found on the Oak. Anyway, probably on account of its importance in the legend of Balder the Beautiful, it has, right from the time of the ancient Druids to the present day, been respected, despised, or treated singularly by peoples of all nations.

SOME QUEER USES

In our own country the Mistletoe has been put to many uses other than that of decorating the house and encouraging frivolity. The Druids gathered its branches off the Oak tree with great ceremony, and distributed twigs among the people. The "Heaven-born" plant was considered to be a remedy against poisons and a safeguard against all diseases, as well as a charm against all witchery.

Coming to comparatively recent years, the Worcestershire farmers gave it to the first cow of their respective herds that gave birth to a calf in the New Year. This ensured good luck in the dairy. In Lincolnshire St. Vitus' Dance was thought to be overcome by water in which the Mistletoe fruit had been boiled.

Going to Italy we find our subject was considered to be a cure for epilepsy if carried about on the person. The theory was that as Mistletoe had never touched the ground, the bearer could not fall. Another use in that country was for the cure of ulcers. Some of the chopped up leaves were eaten, and some applied to the sore. Still another queer supposition was that Mistletoe would extinguish a fire, or any building containing it would be immune from destruction.

In Germany a piece of Mistletoe was carried by the huntsman to bring him luck in the chase; and a belief was current that it would cure green wounds.

Japanese gardeners had so much faith in the Golden Bough that they believed it made their gardens bear plentifully. The leaves were chopped up finely, much prayed over, and then mixed with seed. Most of it was scattered over the garden, whilst the remainder was eaten.

Perhaps the most peculiar belief of all was that existent in Austria, where they thought it to be a key to open all locks. A twig laid on the doorstep would also stop the householder from having nightmare.

Another name for Mistletoe in Fran
Herbe de la Croix. The Cross of
Saviour was supposed to be made of its
The plant was then a normal tree, but

Mount Usher, a lovely garden in the Wicklow Mountains

Mount Usher

IN the Wicklow Mountains is a garden
is justly called one of the most beau
on this planet. Mount Usher belong
Mr. E. H. Walpole, and I do not feel a
competent to write about such a wonde
place.

To tell of half the treasures there w
fill a large book, and it is difficult to
in a short space any idea of the real be
of the garden. The first thing that str
me was the mass of wonderful colour, no
sightly labels, and everything growing
happily and naturally, a result which c
only be achieved by one who thoroughly lo
and understood his subject. To anyone
loves beautiful flowers, plants, and trees
is, indeed, a paradise, and such an inter
ing paradise one would like to stay there
many months to see the different shrubs
plants in bloom in the different seasons.
is impossible to give a list of them all,
among the things I admired most were
Eucalypti; some of them have grown t
height of 80 feet to 100 feet, and such perf
shaped specimens, with their graceful gr
blue leaves. They make a lovely backgrou
for a garden. When I was there at the
of August, two nice trees of Brugmansia a
Datura were in full flower, with their fasc
ating bell-like blooms, one a glowing sha
of orange, and the other a soft shade of y
low; it was marvellous to see them bloomi
in the open. Lapageria rosea climbs up t
trees, and anyone is lucky who can grow t
plant with its rosy, bell-shaped blooms dro
ing in myriads and making a lovely glow
colour. Celmisias and Tricuspida
lanceolata thrive well, and drifts of Myos
tideum nobile, the beautiful Chatham Isla
Forget-me-Not, and Meconopsis Baileyi—c
there be two more beautiful blue flowers? T
species of Magnolia do well; Rhododendr
Zeylanicium from Ceylon, and the rare Bir
Betula Wilsoni, and, needless to say, the mo
attractive of all Brooms, Dorothy Walpo
originated at Mount Usher. A great char
of the garden is a river running right throu
it, and many little streams running from
to other parts, with all sorts of Ferns a
flowers hanging right down to the water
edge. Through the kindness of Mr. Walpo
members of the R.H.S. of Ireland are a
mitted to his beautiful gardens on five da
of each week, and many people must owe hi
a debt of gratitude for enabling them to vie
such a rare and magnificent collection.

DOROTHY BUCKNALL.

[We are indebted to the *Dublin Evenin*
Mail for the use of the three delightful phot
graphs of Mount Usher that accompany th
article.—ED.]

MOUNT USHER

The gardens of Mr. E. H. Walpole at Ashford, Co. Wicklow

REMINDERS FOR THE WEEK

Southern and Midland

The wild garden

Many plants which have been naturalised are now rather untidy in appearance, especially those with very large leaves, and as in many instances Snowdrops and other early-flowering bulbs are planted among them, it will be advisable to have this decaying foliage removed so that the bulbous plants, both large and small, may be seen to advantage. The present is a very good time to make fresh plantations of coarse-growing subjects which do not call for the same care as plants of a more refined nature—Funkias, Day Lilies (Hemerocallis), Lysimachias, Saxifraga peltatata, Solomon's Seal, Water Forget-me-Nots, Primulas, and King Cups; Michaelmas Daisies are plants which could still be planted.

Rubus, Rose species, and ornamental grasses

Among the former are many very handsome evergreen kinds which, allowed a fair amount of freedom, form rather beautiful carpets of attractive spiny growths and pretty leaves. Many people train these to rough poles, and in this way they are often very attractive, but there are some of them which absolutely refuse to thrive when so elevated, but which revel when left on the ground, rooting and extending quite freely.

Groups of Rose species

These are very lovely, both in flower and fruit, and require little attention except preparation of the soil before planting. I strongly recommend the following for this purpose:—Rosa rugosa in all its forms, R. rubrifolia, R. altaica, R. hispida, R. Gallica, R. Moyesii seedlings, R. Duponti, R. rubiginosa, and R. Anne de Geirstein. Split up and transplant ornamental grasses of all kinds which show loss of vigour.

Hardy Ferns

Most of these may be safely transplanted at the present time, and where from exhaustion or other reasons plants have developed signs of distress, they should be broken up and replanted in fresh soil. Most Ferns enjoy leaf-soil, and this should be generously provided. Partial shade is desirable for the majority, and plenty of space should be given to the large growing kinds such as Osmundas, Struthiopteris, and Polystichums. Christmas Roses are often very happy growing among Ferns.

What not to do

Do not tie newly-planted climbers out immediately they are planted, but allow the soil to become settled, and thus avoid suspending the plant. The same applies to newly-planted trees, which should be lightly slung to supports for the time being, their final tying being reserved for a later date when the soil has settled down. Do not prune Clematis alpina, Chimonanthus fragrans, Hamamelis, Cornus mas, Jasminum nudiflorum, Stachyurus præcox, Amygdalus nana, Forsythias, Corylopsis, Nuttalia cerasiformis, Ribes laurifolium, Pyrus japonica, Parrotias, or Staphyleas until after they have bloomed.

Christmas fare from the outdoor garden

Our Hollies (probably the finest evergreens in the world) will be in great demand this year owing to the extraordinary crops of berries, red, orange, and clear yellow, which render them so gorgeous in the open. I would, therefore, draw attention to the necessity of planting a few of those which a
most strongly while the idea is fresh in
mind, as they may now be seen in fruit
should be chosen before they have been
by the birds. Ilex Hodginsii, Wilsoni,
nocki, Camelliæfolia, Shepherdii, Mu
Aquifolium var. fructuluteo, Altaclar
are a few worthy of the notice of inte
planters and could be planted safely
Danæ laurus (or Victor's Laurel) is an
precious plant, the graceful growths of
are in great demand, not only during th
tive season, but throughout the whole y

(*By Edward Goodyear*)

A Christmas decoration: Poinsettias, Dracænas, and Cocos Palm

The fruit garden

Pruning calls for daily attention and
be pushed forward at every opportu
This will be followed by a sprayin
caustic alkali. A light dressing of basic
or approved fertiliser will then be given
the surface soil lightly pointed over, the
being carried out when it is too cold
pruning. Fruit in store must be frequ
examined, and this provides useful
during inclement weather.

Potting

No further potting of plants can use
be carried out. Any such contemplate
any rate will be all the better if left until
New Year is with us, even plants growin
warm houses. This, however, does not a
to bulbs, which may be potted up at aln
any time.

Lilies

Lilies are now being offered freely, and
should grow a few of these, which may
potted up and placed in cool houses or fr
proof frames.

Chrysanthemums

As these lose their freshness they should
cut down and the stools removed to
frames for the production of cuttings,
flowers in decay are not only offensive
injurious to fresh and later blooming kin
and liable to spread mildew.

Kitchen garden

Complete draining and alterations as so
as possible. Inspect all tools, attending to
repairs, and make a note of necessary
newals. Prepare a good stock of labels, a
during bad weather a start must be ma
with the preparation of Pea and Bean stick

The vineries

As the various houses finish off the ripe
ing of the wood, pruning should be carri
out and full advantage taken of incleme
weather to have Vines and houses thorough
cleaned. Those fortunate enough to be fr
of Mealy Bug have a comparatively easy jo
but where this pest abounds it is impossib
to be too particular in clearing the rods
all loose bark, painting them with a stro
solution of Gishurst Compound, or oth
suitable insecticide several times, removing
loose debris, and burning such at once whi
carefully limewashing walls and brickwor
Scrub all glass and woodwork with soap a
water, and do everything possible to get r
of this pest.

Peach houses

The Peach is very easily excited in
growth, and when the buds begin to swe
they are very easily knocked off, so it
always desirable to get pruning, training

Esther (Selene x concolor)

A neat flower, pale greenish yellow with broad white edge to the dorsal. Shown by Mrs. Carl Holmes, The Node, Codicote, Herts. Award of Merit

Memoria J. H. Walker

Very bold and well proportioned, with large dark maroon dorsal edged white. The pouch is reddish bronze and wings golden bronze. Shown by Armstrong and Brown

Cypripediums richly coloured formed the chief feature at the R.H.S. last meeting of the old year, when no less than 17 groups of Orchids, all of very high quality, were on view. Above are two new Cypripediums shown on this occasion

cleaning carried out while the trees are quite dormant. Be as thorough as pos- ie in the way of cleaning both trees and uses. Trees in good bearing will be bene- d by having an inch or two of the surface loosened and removed and some good n fresh loam put in in its place. Be care- not to damage the roots.

rly Tomatoes

o have ripe fruits during May a small ving should now be made, but there is no in attempting this unless a good light use with a temperature of 55 degs. to 60 gs. can be given them. Sow thinly in 4- h pots, and as soon as growth shows have m raised up on a sunny shelf quite close the roof glass. Prick off into 2-inch pots soon as large enough to handle.

akale

here will now be less difficulty in getting crowns to start than was the case six eks ago. Introduce fresh roots as often is necessary to ensure a steady supply of od tender produce. A genial, moist at- sphere and total darkness give best re- lts, a strong dry heat making the stalks gh and insipid.

hubarb

Another batch of Rhubarb should also be anted in warm quarters. It grows more pidly in darkness, but the stalks are of or colour and quality under these condi- ns. Planted in a fairly light place (under e stages of a warm greenhouse will suit) the crop will be finer and the crowns will continue in bearing much longer, so it is a matter of taste as to which method is pursued.

Planting Rhubarb out-of-doors

While plantations of Rhubarb continue to bear well for quite a number of years if well treated in the way of manure, it will eventually require to be transplanted, and the present time, if the soil is in a fit state, is quite suitable for laying down new plantations. The ground should be double-dug and plenty of good farmyard manure mixed with both bottom and top spits. Allow some 5 feet between the rows and 4 feet from plant to plant in the rows.

Attend to the Rose bushes

By reason of their being swayed backwards and forwards by the action of the wind, many Rose bushes are considerably damaged, and if not attended to may even be killed by the spring. It is desirable, therefore, carefully to go over the beds and with some old potting soil fill in the holes round the "necks" of the plants, setting each upright and then ramming the fresh soil well home with a blunt dibber. This may have to be repeated, but is well worth the little trouble entailed.

The rock garden

Usually quite a quantity of leaves and twigs get blown into the rockery, and these, if left for any length of time, will inevitably do considerable harm to many of the finer Alpines, besides being an eyesore at all times. Select a calm day, therefore, and get all the worst of this debris removed before harm results.

Planting hedges

Any work of this kind can very well be carried out during open weather. It should be remembered that much better results are had with hedge plants if the ground is properly prepared before planting begins. Deep digging and the introduction of some good fresh soil will be well repaid later.

Plant hardy trees and shrubs

This is work that can often be successfully carried out while the soil in the kitchen and flower gardens is too wet for digging. It is a mistake to imagine, as some planters seemingly do, that any kind of soil is good enough for these. It will pay where the soil is really poor to introduce a little good soil in which to give the young plants a start.

Vacant flower beds

Leaves are down for the season, and it is now in order to manure and dig deeply all vacant beds and borders and so make everything tidy for the season. Where manure is scarce, excellent results are had by the substitution of decayed garden refuse. Apply this liberally and nothing but good will result. Do not rake the surface of the beds, but leave rough so that the elements may sweeten and pulverise the soil to some depth.

C. Blair.

Preston House Gardens, Linlithgow.

Answers to Queries

***Queries**—Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

***Naming plants**—Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

***Naming fruit**—Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

FRUIT

Vines

Could you advise me as to temperature of vinery after annual cleaning. The Vines' roots are outside; also, about what time to start into growth. IGNORANT.
Bickley, Kent.

[Keep the temperature as low as possible, but do not, of course, allow frost to enter, not that a degree or two would do any harm to dormant Vines. If the Grapes are only wanted in late summer and autumn, early in February is a very suitable time for closing the house. Do not make the mistake of beginning with a high temperature. From 45 degs. to 50 degs. is about right for the first fortnight or so, afterwards gradually raising it as the days lengthen and the sap begins to rise. For early Grapes you must start now, but with the roots in an outside border the process would be rather slow.]

Old Vines

I have two Vines on the spur system, six rods to each Vine, and about 18 inches between each rod. I am thinking of cutting each alternate rod out and running up new ones next year in their places, and then, at the end of next year, cut the other three old rods out and run new ones in their places. Shall be pleased to have your advice.
REGULAR READER.

[Your method for improving your old Vines is quite a good one—up to a point. You cannot have a young rod in full bearing in one year, so if you desire to carry up six rods again you cannot do this in successive years, but must wait until the first three have attained full fruiting capacity. We are not, however, in favour of having rods only 18 inches apart, this being much too crowded. Had we the management of these Vines we would only have three rods instead of six, and would then have much better fruit. We would, as you propose, cut out every alternate rod, run up fresh young growths in their places, and a few years hence, when these young canes have come into full bearing, would cut away the other three old rods, but would not replace these with fresh ones.]

Peach trouble

(A Regular Reader).—We are not familiar with a fungus causing a black spot on the foliage of Apricot and Peach. If you would like to send us specimens of the damaged foliage, packed in a tin box, we could probably help you. Peach Scale can be killed by thoroughly spraying the trees with lime sulphur, using three quarts of the concentrated material to 10 galls. of water. The creatures not killed by this treatment should be sprayed with a good insecticide during the growing season.

Apple Scab

(Sunflower).—Your specimen fruit is affected with Apple Scab. The fungus can be controlled by spraying with lime sulphur in the pink bud stage, *i.e.*, when the flowers are showing colour but the petals are unopened. The strength at this stage is usually 1 in 29. A second spraying is given when all the petals have dropped from the flowers, and a third three weeks later. The strength of wash used for the second and third sprayings is usually 1 in 59, but certain varieties liable to spray damage are sprayed at the strength of 1 in 99.

CHRYSANTHEMUMS

Spraying Chrysanthemums

I should be so much obliged if you could tell me of a strong-spraying wash for "Red Rust," which I could use on the stools of Chrysanthemums before we take fresh cuttings.

Unfortunately, I had some new plants sent last year and they must have had the rust on them, as several of the plants have been badly attacked. However, I propose to thoroughly clean and spray the house and plants when the show of bloom is over. It is said that one can never eradicate the rust, except by burning the entire stock, but as I have several rather good Chrysanthemums (some 30 kinds), I should be sorry to destroy a collection made during several years.
Rye, Sussex. MAY Y. E. TATE.

[You should write to H. J. Jones, Ltd., Ryecroft Nurseries, Hither Green Lane, Lewisham, S.E. 13, and ask for particulars regarding their Anti-Blight Powder. We believe this preparation is very effective against Chrysanthemum Rust. Dilute Bordeaux Mixture is also sometimes effective.]

TREES AND SHRUBS

Destroying Elm tree stumps

Would you be so very kind as to tell me how best and most quickly to destroy Elm stumps and roots We have just had three large Elms felled in our garden on account of the mischief done by their immensely long roots, with which the flower beds anywhere near were quite stiff. I am very anxious to kill these roots thoroughly, and to destroy the stumps. Can it be done with saltpetre and firing We cannot dig the roots out on account of the large area they cover.
M. L. WILLIAMS.

[In such a case saltpetre would be of very little use. Drill a few large holes with an augur as deeply as possible without going right through the wood. Fill these holes with petroleum on two or three successive occasions, in this way the petroleum will penetrate to all parts of the stumps.

When thoroughly soaked, place a pile of dry wood over each stump and set it alight. Keep the fire attended to for a time and most of the stump should burn out. Another method, where such is possible, is that of blowing them out with gunpowder and time fuse, a hole being drilled fairly deep into solid wood, the charge and fuse inserted, and the hole wedged up tight and fired, but this
only be carried out by someone experi
in the matter.]

Magnolia fruiting

(R. B.).—It is not altogether unusua
Magnolias to produce fruits, and no doub
very hot, dry summer assisted them in
so. The fruits are curious looking; son
them are even more peculiar than the
which you send.

Holly not fruiting

A perfectly healthy Holly is covered
year with blossom, but never has any ber
Soil and situation are good. Can you
cate any treatment? H.
Sunderland.

[The Holly is a peculiar tree. Frequ
it is unisexual in character, and such pl
may produce pollen-bearing flowers
The fruits fail to appear if both sexes are
grown. No doubt this is the cause of
Holly not fruiting.]

VEGETABLES

Celery diseased

(A. R. P.).—It is probable that your pl
are affected with Heart-rot (see reply in i
December 7th, page 830). This troubl
encouraged by the liberal use of manu
largely nitrogenous in character. By us
phosphates and potash as advised you sho
correct this in future years.

Seaweed as manure

(S. M.).—This is quite useful for
Brassica family, but we do not agree tha
requires supplementing by kainit. Seaw
contains a good deal of potash and a g
deal of salt, which are the important
stituents of kainit. Moreover, we sho
never advise lime to be mixed with it. T
would involve a loss of nitrogen. Apply
lime in advance.

FLOWER GARDEN

Manure for flower borders

("Landale").—We do not favour the
of the two materials you name. An excell
substitute for farmyard manure is w
decayed garden refuse. If this is free fr
stones, perennial weeds, and woody su
stances it may be freely used among h
baceous plants, lightly forking it in all o
the beds or borders. A good sprinkling
bone-meal, in addition to the decayed refu
would be beneficial and lasting. If you ha
none of this material at hand, Wakele
Hop Manure is excellent, clean to use, a
beneficial to most plants. Directions for
are supplied, along with the manure.

Diseased Alpine Pinks

(W. H.).—The specimens sent for
amination are affected by a Carnation Le
Spot. If only a few plants are affected y
should take them out and burn. Sprayi
the others with a weak solution of liver
sulphur might help to check the spread
the disease. Keep as much air on the fran
as you can. In wet weather put a 3-inch p
under the lights at each corner, then yo
plants would get plenty of air and, at t
same time, be protected from rain. The Le
Spot present always gives rise to trouble
plants kept on the damp side.

GREENHOUSE

Cyclamen grubs

(R. R. Penshaw).—Your Cyclamen a
attacked by the grub of the Black Vin
Weevil, Otiorhynchus sulcatus. We a
afraid that the only control you can adopt
this period is to shake out the attacked plan
and destroy the grubs. Another year yo

d attempt to trap the adult weevil before begin to lay their eggs. A good soil ticide would kill the grubs if you could t into the pots, but we are doubtful if can do this. See Correspondence note is subject next week.

enium foliage

rs. F. Dashwood).—The specimens of enium (Pelargonium) foliage are at- ed by a mite similar to Begonia Mite. creature is not unlike Red Spider, but ler and colourless. You cannot see the with an ordinary pocket-lens, but you see numbers of them if you use a glass times. The pest can be controlled by sulphur in a Campbell's Sulphur Vapor- You can obtain this apparatus through seedsman. Full directions are sent with apparatus.

agating Carnations

I. A.).—Select sturdy but not unduly side shoots and insert firmly round the s of small pots filled with very sandy ost. If a little bottom heat can be given uch the better, but really strong heat lead to failure.

MISCELLANEOUS

len Pests

B. E., Alnwick).—Your specimens arrived safely this time, and they are imens of the so-called "Cutworms" or rface Caterpillars." This term is used over the caterpillars of a number of moths h have similar life histories. The moths erned are The Heart and Dart Moth otis exclamationis, L.), The Turnip h (Agrotis segetum), and the Yellow erwing (Agrotis pronuba). We think your specimens are the caterpillars of latter. Cutworms spend the day resting he surface soil and feed at night, usually ng through the plant attacked just at nd-level, hence the term "Cutworm." caterpillars feed more or less through- the winter and pupate in April. The hs appear in June and July. Hand-pick- is a good method of control. All plants ch show signs of attack should be mined and the surrounding soil stirred a blunt stick. The culprit can usually discovered and destroyed. In all positions re an insecticide can be used try the effect a good soil insecticide, such as naphtha- , at the rate of 2 ozs. per square yard. ead the material on the top of the soil and it in 5 inches or 6 inches deep. This is frequently confused with leather et.

nts and lime

notice in your issue of November 23rd you , in reply to "E. D. D.," that "some nts will not tolerate lime in the soil." ilst well aware that such is the case, I e never been able to find a list of those nts that are averse to lime, and, as I have ntly applied burnt lime fairly heavily to a tion of my garden, should be much obliged ou could let me know what plants to miss until the lime becomes absorbed.

JOHN H. MAXWELL.

You do not state to which section of your den you have applied lime. If your vege- le garden has been dressed you will find all your crops will do better, with the sible exception of Potatoes. A direct ap- ation of quicklime, while not affecting the ntity of the Potato crop, does not improve quality. Our warning was put into D. D.'s" reply because there are many es and shrubs which appear not to be able grow in a limestone formation or in a soil ere lime has been added in fair quantities. give a detailed list of plants averse to e would be impossible, but, broadly speaking, plants that delight in peat and leaf-soil will not tolerate lime. Most plants in the Natural Orders Ericaceæ and Vacciniaceæ do not like lime, and often refuse to grow at all where it is present. Genera which grow best away from lime are:—Rhododendron, Azalea, Kalmia, Pernettya, Erica, Gaultheria, Ledum, Arbutus, Andromeda, Vaccinium, Clethra, Dabœcia, Menziesia, Arctostaphylos, Pieris, Zenobia, Leucothœ, Lyonia. It must be pointed out that there are many exceptions in the above list, *e.g.*, Rhododendron hirsutum and R. Chamæcistus do best when lime is present. Erica cinerea and E. mediterranea thrive on chalk. Most conifers do best away from chalk, but quite a number thrive when chalk is present.]

Lawn sand

The formula for lawn sand frequently quoted consists of amm. sulph., iron sulph. (copperas), and sand in proper proportions. I take it that the sand is simply a "vehicle" for diluting and spreading the chemical components. (On heavy soil it is also, no doubt, useful in itself.) Both amm. sulph. and iron sulph. being readily soluble, would it not be equally efficacious to dissolve them in water, dilute to necessary strength, and apply to lawn when the surface is dry by means of a fine rose can, or, better still, a sprayer? If the sand is really necessary it could be spread separately, preferably before spraying. I have never seen such a means of applying "lawn sand" suggested, and I should be glad of your comments before experimenting with it. I have for the past two seasons mixed my own lawn sand, and I therefore know the difficulties connected with the thorough drying of all ingredients, and also the difficulty of spreading evenly when there is the very slightest movement in the air.

"COPPERAS."

[The sand in the formula such as you quote is used as a carrier and helps to ensure even distribution. Applying ammonium sulphate or iron sulphate in solution would not have the desired effect upon your lawn. The theory underlying the practice of using lawn sand is that salts such as ammonium sulphate and iron sulphate when applied dry to green plants burns the foliage because of the great affinity these salts have for water. The water is in the main extracted by the salts from the foliage on which it alights. The use of lawn sand is permissible because the plants which are desired have upright, narrow leaves and the salts applied do not stay on the foliage any length of time. The plants that are not desired—Clovers, Plantains, Daisy, Bugle, etc.—have relatively broad, flat leaves. The salts lodge on this class of foliage, with the result that these plants are gradually destroyed. A dressing of lawn sand is most effective if applied so that seven or eight days without rain follows a dressing of lawn sand, and is of little use if followed immediately by rain. Leave out the sand by all means if you can spread evenly the desired quantity of ammonium sulphate and iron sulphate. Fine, dry garden soil is a good substitute for sand. The effect of lawn sand applied dry is first to burn the foliage of weeds, and secondly to encourage the grasses to grow, and so fill the blank spaces left by the dead weeds.]

Seeds of Photinia villosa wanted

(Mrs. F. Olway Johnson).—These are very difficult to find, but a few are obtainable from Messrs. W. Th. Ingwersen, Ltd., Birch Farm Nursery, Sharpthorne, East Grinstead, Sussex.

Aponogeton distachyon wanted

(C. L.).—This plant is offered by V. N. Gauntlett and Co., Ltd., Chiddingfold, Surrey, and also by Messrs. Perry, Enfield, Middlesex. It may be safely planted at the present time.

Lachenalia glaucina and L. orchioides

In reply to K. C. Stanford's inquiry *re* these Lachenalias I cannot trace anyone growing them in England, and have been trying to find them for several years. Thanks to the Botanical Society of South Africa, I received seeds of both species and raised a good quantity of both, and hope in the course of time to see them in flower.

G. H. DALRYMPLE.

The Nurseries, Bartley.

SHORT REPLY

"*Ignorant.*"—You cannot successfully grow Tomatoes in an Orchid house.

TRADE NOTE

Player's Please

There are few in these days to whom a gift of cigarettes for Christmas is not acceptable. Handsomely Decorated Tins of Player's Navy Cut Cigarettes can be obtained. For the pipe smoker such old favourites as Player's Navy Cut, Player's Navy Mixture, and Player's "Airman" and "Digger" Tobaccos provide an excellent choice.

The National Carnation and Picotee Society

The above Society held its 51st Annual General Meeting at the New R.H.S. Hall, London, S.W. 1, on Saturday, December 14th, when there was a good attendance of members. The Council's 1929 Report (for nine months, as the Society's year now ends on September 30th instead of December 31st) showed that the Society was in a flourishing condition, and that the period under review had been very successful, with an addition of fifty members and affiliated societies, and a balance in hand of £70 as against £50 for the previous 12 months. The fifty-second annual exhibition held on July 18th and 19th in conjunction with the British Carnation Society was most successful, and, notwithstanding the adverse weather conditions prevailing at the time and last minute cancellation of entries, the space filled was much larger than on the initial joint occasion. The Society's thanks were accorded to the Hon. Sec. of the B.C.S., also the R.H.S. Officials for their wholehearted co-operation. It was intimated that another combined exhibition will be held in the R.H.S. Old Hall on July 15th and 16th, 1930. The Hon. Sec. reported the gift of three additional trophies for 1930—The "Lady Hudson" Cup (Open) for Clove-scented Carnations, the "Abol" Cup (Open) to be won outright for 12 vases consisting of three of each Border Carnations, Clove-scented Carnations, Picotees, and Pinks (any section), distinct varieties, three blooms or stems of each, and the "Julia B. Wells" trophy, to be won outright (Amateurs only) for Picotees. It was intimated that the Society's publication, to be known in future as "The Carnation Annual," would be issued in the New Year and would be a great improvement on previous issues and a book well worthy of the Society. At future exhibitions the Society's special medal will be awarded to all winners of Cups. The retiring President (Mr. Edmund Charrington) was unanimously re-elected with the best thanks of all for his continued support and generosity. The following were elected on the Council for three years:—Messrs. T. J. Child (Catford), S. H. Gregg (Bowes Park), A. S. Hampton (Reading), H. A. Knapton (Orpington), A. E. Mustow (Worcester Park), and F. W. Seymour (Finchley). The Hon. Sec., Mr. A. E. Amos, of Colchester, Hon. Assistant Secretary, Miss J. B. Wells, of London, and Hon. Treasurer, Captain E. M. Wilkinson, of Havant, were unanimously re-elected with aprpeciatory thanks for past services. The new appointment of Hon. Show Superintendent was filled by Mr. T. J. Child (London), and Messrs. Howard, Morris, and Crocker, of Portsmouth, were elected Hon. Auditors, whilst a hearty vote of thanks was accorded the retiring Auditors, Messrs. Burnett, Burnett, and Swayne, of Southhampton (occasioned through the Hon. Treasurer's change of address.)

Hull and East Riding Chrysanthemum Society

The Hull and East Riding Chrysanthemum Society recently held their highly successful 29th annual Show in the City Hall. Besides Chrysanthemums, there was a great show of vegetables culled from the 300 acres of land in the possession of local allotment associations. The scene in the main hall was a feast of beauty, considerably enhanced by the fine Trade Exhibits, both of local firms and those from other centres.

The judges said they had never seen exhibits so advantageously staged; there was no corner of the main hall from which the whole of the many exhibits could not be seen to good effect in every detail. Trade exhibitors put up some varied and wonderful displays. E. P. Dixon and Sons, Ltd., Hull, occupied one end of the main hall with a varied display of 'Mums, floral designs, and fruit, prominent among which was a floral lighthouse illuminated, and with the revolving lamp in action all the time. The opposite end of the hall was occupied by A. Train and Sons, Hull and Thirtleby, with banks of flowers, foliage, and plants, conspicuous among them being a new Asparagus, A. Sprengeri elegans. Trade exhibitors from other parts were represented by Sutton and Sons, with one of their usual fine displays of vegetables, common and uncommon; Kent and Brydon, of Darlington, with an exhibit solely of Potatoes, including Sefton Wonder, for which they offer prizes; Mr. Woolman, of Birmingham, with some especially fine Chrysanthemums, including Desert Song, single, Trent, White Joy, and Hugh Mitchell, Jap.; and Mr. A. G. Vinton, of Balcombe, Sussex, who had a fine display, including such varieties as Enid, G. Fox Wilson, Golden Absolute, and Balcombe Bronze, a fine terra-cotta decorative. Among the principal prizewinners were the Right Hon. T. R. Ferens, P.C.; Arnold Reckitt, Esq., Elloughton; Captain Adrian Bethell, of Rise Park; T. W. G. Hewett, Esq., Weelsby Old Hall, Grimsby; A. D. Hall Watt, Esq., Bishop Burton Hall; The Lord Hotham of Dalton Hall; Major G. L. Bennet, Grimsby; Sir Alexander MacDonald of the Isles, Bart., Thorpe Hall; Mrs. Edwin Robson, Sutton House, Sutton on Hull; and T. B. Sissons, Esq., The Grange, Willerby.

When We Were Very Young

From the first Christmas Number of Gardening Illustrated

Dried Grasses in Christmas decorations

Ornamental grasses, though beautiful, are not much appreciated by the generality of people; still many florists are now beginning to use them largely for decorative purposes; doubtless amateurs will follow suit. There is an immense variety of elegant species well suited for bouquets, and assortments of 20 or 30 varieties will be supplied by any London seedsman for a mere trifle. It is almost needless to mention that both grasses and Everlastings may be mixed with ordinary flowers, either when fresh or in a dried state. Of late years, it has become the custom to use both Immortelles and preserved autumnal foliage along with the evergreens for Christmas decorations. The Maple, Oak, and other leaves are very beautiful, varying from pale yellow through all the shades of red and brown to the deepest crimson tint imaginable and, being sold loose, they can be arranged according to fancy. With such materials some very elegant arrangements in the way of wreaths, crosses, bouquets, and vases may be made, according to the taste and ingenuity of the artist.

Keeping Walnuts for Christmas

Having tried to keep Walnuts in such a condition that the substance surrounding the kernel would peel off, say, at Christmas, or afterwards, I confess to not having been so successful as I could wish, although I have tried all the plans that I could hear of. I even tried bottling some and sinking them in water, or, rather, filling some jars with them, corking them up, and placing them in water, but the result was not satisfactory. Packing them in sand was strongly recommended some twenty or more years ago, but it was not an easy matter to get the sand out of the wrinkles of the shell, even with a brush and water. Bran did not answer at all, and dry wood ashes seemed to have an unpleasant habit of clinging to the shell, without in the least increasing the keeping qualities of the kernel. I was lately induced to try salt, and filled a jar with alternate layers of Walnuts and dry salt—a plan which I certainly prefer to sand, owing to the difficulty of getting rid of the latter; still, neither of these plans secure the fresh taste possessed by the Walnut when gathered from the tree, and the inner skin, if we may call it so, does not peel off well. I have found no plan so good as that I recommended some dozen years or more ago, but to the discovery of which I lay no claim. As, however, it may not be known to all, I will mention it here. It consists simply in keeping the nuts in as cool a place as can be had. Each day as they are wanted for use, take some and slightly crack the shell in one or two places—if a piece comes off no matter—and put them in warm water for an hour or so. Afterwards take them out and put them in cold water with a little salt in it. The cold water restores the crispness, which the warm water had in some degree injured, and the nuts eat as well or nearly so as when fresh gathered, the inner skin peeling off quite readily.—KENT.

Pitmaston Duchess Pear

This is becoming a very popular Pear; it is a free grower, and produces very fine fruit, rich and melting. One fault belonging to many of our finest Pears is that they either refuse to grow or produce such weakly wood as to be unable to perfect a crop; but this variety appears to grow well in soils of various descriptions, and I hear it highly spoken of by growers who have all the best varieties from which to select.—J. G.

—December 20th, 1879.

Ridging vacant ground

The drenching season we have experienced far and wide must have taught the majority of cultivators that the earlier this work is proceded with the better, especially soil of a retentive nature, so that it may rid itself of superfluous moisture under the drying influence of wind and any sun that may be given us during the next few months. There is no reason, as far as our knowledge lays, why soils of a light and more porous soils should not be treated similarly; such exposure to all weathers, as we well know, tends to sweeten it, and many soils are over-fed with rich manure year after year which, if opened up to the elements for a time, will eliminate whatever weather may be in store for us.

On the other hand, there are hungry soils which would benefit by intermixing a little fresh loam, lime, wood-ash, or partly-decayed leaf-soil, while in the case of a more or less clayey nature would lay more open if something in the way of a strawy character from either the stable or cow-house could be worked in between the spits, whether it be two or more, whichever each case admits. We manure and dig our ground in the of the year as a rule, as labour is none plentiful in many gardens for such work be done after the shortest day has pass Where it is otherwise the manuring of li sandy or stony soil in the early months wo provide more food for the respective cro as the goodness of manure put into ground in autumn must in some seasons washed out of existence by the time cropp comes round in the early spring. Avoid much as possible the working of the grou while in a very wet state; it is uncomforta for the men, they are lifting extra weig and cannot make the progress they would under drier conditions. Ground dug with few degrees of frost in or a drying wind p sents the ideal opportunity of performi such laborious work.

For preference, the ridges are best runni north to south, as they get the maximum sun in the short days ahead of us during next couple of months or so, and ground treated always works down most satisfacto after the winter's weather, whatever may forthcoming.

A POSTCARD

will bring you a free copy of

DISCOVERY

the magazine which presents modern knowledge with a popular appeal. This is an age of discovery, of progression in all phases of science. Are you keeping in touch with developments, or does your newspaper nowadays contain items which convey little to you?

Does Einstein's new theory mean anything more than a newspaper headline?

Do you know that a moon rocket is now actually undergoing construction in Germany?

Is the great advance in the science of food values and dietetics known to you only by the one word "vitamins"?

On these and many other subjects **DISCOVERY** can keep you informed. Its contributors are experts, but experts who can impart their knowledge in non-technical language.

They make their subjects live and invest them with an enthusiasm which the reader shares. The journal is printed on art paper, so that its many illustrations are reproduced with admirable effect.

DISCOVERY is educative without being dull.
DISCOVERY is modern and yet authoritative.
DISCOVERY is distinctive and always up-to-date.

SEND YOUR POSTCARD NOW

THE ENGLISH GRASS ORCHARD

AND THE PRINCIPLES OF FRUIT GROWING

ARTHUR H. HOARE 32s. 6d. net

gives the first complete account of a subject of rapidly increasing importance and profit. This book, which is fully illustrated, is based on wide practical experience and covers all aspects, including both the horticultural and the commercial sides of fruit growing in England.

Write for complete technical catalogue to—

ERNEST BENN LIMITED
Bouverie House, Fleet Street

MAKE YOUR GARDEN PAY

These four books are indispensable to everyone who wants to make his garden more profitable, more beautiful, and less of an anxiety.

SUCCESSFUL SPRAYING
by P. F. Fryer. 7s. 6d. net.
"This book can be strongly recommended to the grower who wants a handy volume in which he will find such information as concerns his plants set out in a concise and understandable manner."—*Journal of the Royal Horticultural Society.*

PRACTICAL SPRAYING
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
This book is one of a series of small practical handbooks written by specialists for the use of market gardeners, fruit-growers, nurserymen, etc. "Practical Spraying" describes the most effective measures to take against the various pests and diseases that ruin crops.

VIOLET CULTURE
by F. E. Dillistone, F.R.H.S. 2s. net.
This is the first book ever written explaining how to grow violets for large scale production in this country. It is full of expert information, and will prove equally valuable to the market gardener and to the amateur grower.

STRAWBERRY CULTURE
by J. W. Morton, F.N.I.A.B., F.R.H.S. 2s. 6d. net.
"The grower who cultivates a crop with brains stimulated by Mr. Morton's little book can reasonably expect to make a profit."—*Farmers' Express.*
"Of the utmost value to growers." —*East Anglian Daily Times.*

A catalogue of other books of interest and importance to the gardener will be sent free on application to—

December Flowers in the Open Air

URING all the recent gales and storms here has been a determination on the art of some of our hardy outdoor sub- ts to produce their handsome blooms in ildest profusion, the first of which is inter Jasmine (Jasminum nudiflorum), has never been more lovely. It is most ful if properly thinned and cared for, would rival the Wistaria in its season, its long, elegant arching sprays of ang yellow flowers, which continue for rs on end. Those who are satisfied with congested, gd mass of this er we so often e with know hg of its grace- eauty when ly treated, or kceptional love- as a cut flower, e of which is a deed in a sunny ow on a Decem- day. Another which arrests nostrils of rs-by at the nt time and an habitant of gar- is the Japanese nthus Aquifoli- and its purple y which are with deliciously d white flowers ne in axillary rs.

garden friend nly halts, and ms: "What a ous fragrance! e does it come ?" when a little ration reveals nyriads of tiny vers. Well- red branches of are welcomed in a cut state. Then we the handsomest of all the evergreen sters (Eleagnus macrophylla), with its silvery leaves (delightful in wind and); this shrub is flowering in the wildest sion and charging the air with its de- s fragrance. The flowers are borne in rs in the leaf axils, silvery without, v within, and not unlike a Fuchsia in , its flowery branches, and current n's trails—the latter often 5 feet in h—add beauty and variety for use with evergreens during the festive season.

s one of Marie's fine introductions from Japan. Then we have the Winter Sweet (Chimonanthus fragrans), beloved by all who care for fragrant flowers, the buds of which are already on the point of bursting; never have we seen the bushes—whether on walls or in the open—so laden with them as at the present time.

It is the practice to cut a few branches in advance of bursting and allow them to open indoors, as severe frost is liable to damage fully-opened flowers.

The Fern-leaved Clematis (C. calycina) on cool walls is a shrub of more than passing interest when laden with its drooping yellow flowers, stained with reddish-purple; indeed, when nicely situated, it is a very pleasing shrub which comes from Corsica.

Several of the Heaths are beginning to make a brave show, but all are later than usual. Here we have yet to see the first Algerian Iris, also later than usual. A few Christmas Roses are in bloom, and the beauty of Disanthus cercidifolius is now passing; Viburnum fragrans is in bloom, but has yet to reach its best.

The deliciously fragrant Chinese Witch Hazel (Hamamelis mollis) now flowering in the open at Cannizaro, Wimbledon

Hamamelis mollis

I THINK it will interest you to hear that my Hamamelis mollis is already in flower, in fact, it has been so for nearly a fortnight. This is quite a month earlier than usual, and shows the extraordinary mildness of the winter so far. S. KENNETH WILSON.

Wimbledon, December 18th.

The Shamrock Pea

This delightful little plant was badly hit last winter, but quite a number of roots survived where they nestled at the foot of a low wall on the outside of the Lily Pool, and are now flowering quite freely, the inimitable blue of their lovely pea-like flowers surpassing that of their nearest rival, Gentiana sino ornata, which carpets a large bed on the opposite side of the path. But what astonishes me most (and this in mid-December) is a few boxes of Shamrock Pea lifted in November and stood in a cold frame merely as a precaution against a repetition of last winter, when so many treasures were lost entirely. These are literally covered with twin flowers of exquisite loveliness, and lead one to consider whether such a beautiful subject would not prove remunerative if grown largely in this way, the flowers being used in the same way as Violets in addition to their graceful charm in a growing state.

A plant possessing such splendid qualities should appeal to all, and especially to those who have rock gardens, when it should be planted around the base and on the cool side of boulders, soil of good heart only being used, neither too rich nor too poor.

Planted between paving stones and especially near moist places this little gem of India's river valleys should find a congenial home. E. MARKHAM.

Sussex.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Passer domesticus

I CANNOT refrain from penning a note of thanks to Mr. Hay for his gentle, yet spirited, defence of the sparrow. Like the " deil " (as we say in Scotland) he is " no' so black as he's painted," and there are other birds for whose faults he is sometimes blamed and, alas, punished. Consider the chaffinch. A pair of chaffinches will do more damage to a bed of seedling Brassicas in half an hour than many sparrows would do in a day. What of that beautiful bud-destroyer the bullfinch? Passer, poor outcast, may be bad enough, but he does not, and apparently out of sheer mischief (not to call it devilment), lay waste and destroy the buds of Plum trees and of Damsons. He does not, as the blue tit is alleged to do, peck holes in our choicest ripening Pears; nor does he devour our Cherries, Raspberries, Strawberries, and Gooseberries, as the blackbird and the thrush most undeniably do, given opportunity. He does not, like that gaudy thief, the pheasant, consume incredible quantities of Brussels Sprouts; but, having acquired a bad name, he is persecuted. I am with Mr. Hay in agreeing that the sparrow has his faults—his vices, if you like—but he is such a jolly, argumentative, occasionally disreputable fellow, but always so cheerful, so contented, and so industrious that I have more than a sneaking liking for him. Once upon a time a lady, of whose gardens I then had charge, issued a decree against the sparrow. A sparrow-net was procured, traps were set, a bounty of 6d. per dozen was paid, in spring, for sparrow eggs. Ivy-clad walls, hay-ricks, and other sanctuaries were netted; persecution was relentlessly carried out. The numbers were, not unnaturally, greatly decreased—and then came the reaction. " I do so miss the sparrows; let them get up again." Of this permission they quickly availed themselves and never afterwards were they disturbed—the sparrow-net descended to other uses. Mr. Hay, of course, writes more particularly of town or city sparrows, but their country cousins are no whit less interesting, and I, too, am on their side, believing, as I do, that they are more sinned against than sinning. I do sincerely hope that " Worried," if he does institute a crusade (perhaps pogrom would be a better word) against Passer domesticus, will discriminate between the house sparrow and the charming little hedge sparrow (which is Accentor modularis), a perfectly harmless bird in the garden. A SCOTTISH GARDENER.

TO THE SPARROW.

Oh! Fortunate Bird,
A voice has been heard
 Defending your manners and life;
It seems in Hyde Park,
From daylight to dark,
 No bird thinks of aught but his wife.

What a lesson to man
Who, I'm told, seldom can
 Attain such a rigid exclusion;
We will spare you our seeds,
As we see how it leads
 To a worthy and righteous conclusion.

So, wake me at morn,
Though I don't like the dawn,
 At least, what I've seen as a sample;
Destroy all my flowers!
I devote my last hours
 To admiring your moral example.

ANON.

Rhododendrons in lime soil

In further reference to my note (issue December 14th, page 832) I am growing the following Chinese Rhododendrons:—Yanthinum, pseudo-yanthinum, polylepis, Yunnanense, micranthum, oreodoxa, pachytrichum, and irroratum. R. ambiguum and R. Delavayi are both killed by last winter's frost, though the latter has dwindled ever since planting. R. intricatum and R. hippophæoides grew and flowered well up to last year, but are now apparently dead. All the small-leaved Rhododendrons were seedlings when planted five years since, they are now growing well, one or two of them between 3 feet and 4 feet high. A few inches of decayed peat moss litter was dug into the border at planting time. An old outbuilding was pulled down to make room for the Rhododendron planting, so that the
contains a good amount of lime-rub
we did not trouble to sort this out. Th
drawback to all the Chinese Rhodod
that I have seen is that they start
too early in the spring and are invaria
back by the late frosts. Mine have a
shelter from the north and east, and
does not reach them until after mid-da

he protection of wild flowers

M SIR MAURICE ABBOT-ANDERSON,
C.V O.

attention has been drawn to a para-
in your issue of December 7th, page

Wanted : A Society for the
protection of rare British plants."

Herbert Cowley says : " A Society is
eing formed for the protection of wild
s. It is out to rob the children of their
cups and the cyclists of their Blue-

I, therefore, bring to your notice
a's League "?
amphlet issued by the League tells of
ms and activities, and the card which is
ut with the badge points out that we
not forgotten the rare wild flowers.
I would like to make a special point
ill be seen on F. 4 of the pamphlet)
lora's League has no desire and no
ion of robbing the children of their
cups. As regards the cyclists and their
lls. Is it not possible that they pick
and unnecessarily, and that in-
ally they are robbing everyone else of
that are public property and not in-
for their personal enjoyment only?
here we would countenance picking in
ation, but, unfortunately, this word
does not appear to be part of the wholesale picker's vocabulary.

I should take it as a great compliment and also as an act of fairness if you would kindly make our views known through the columns of your valuable publication.

MAURICE ABBOT-ANDERSON,
Founder of Flora's League.

10a, Abercorn Place,
St. John's Wood, N.W. 8.

——I have read with interest and with sympathy the correspondence in connection with the protection of wild flowers. It may be feared, however, that the formation of a society would do but little good even were it backed by legislation—and that is hardly conceivable. No doubt such a society might do something toward educating opinion regarding wild flowers, but, so long as human nature is what it is, the vandal we will have always with us. The plucking of Wood Hyacinths, of Foxgloves, of Primroses, and the like by children, who afterwards scatter their spoils by the way, is not an unnatural trait—rather, I would say, the reverse. Children rarely uproot wild flowers, and the damage done by them is not permanent. Hawkers are confirmed offenders in the latter respect. They uproot Ferns especially, and Primroses for the purpose of earning a few coppers. It is difficult to circumvent these vagrants—equally difficult it would be to ask people to refrain from purchasing such ravaged plants. At the present season many of us have to deplore ruined Holly trees, Laurels, Yews, and other shrubs which abut on public highways. During the past week I have seen motor-lorries pass in which torn-off—torn off!—boughs of Holly were lying. The drivers, delivering coal or goods, know that there is a market in the town for such; they watch their opportunity and help themselves without scruple—I daresay without realising that they are doing damage, but sure that "trink geld" will be forthcoming from some shopkeeper who is desirous of cheap Christmas "decorations." But even those who know, or ought to know, better are not free from blame. I once discovered a very fine colony of Scolopendrium crispum under an overhanging bank of a stream. Elated by my discovery, I selected two of the best and left the others—some dozens. Unfortunately, I confided my find to the farmer through whose field the stream ran—saying that many a nurseryman would pay a good price for them. Will it be believed? Next day he went with a horse and cart and cleared them out to the last plant. Since then I have made no confidants concerning any plant discoveries I have made. Within a mile from where I write I know of a shady glen in which the rare Filmy Fern (Hymenophyllum) grows sparingly; but wild horses will not drag the secret from me. Occasionally I make a solitary pilgrimage to gloat over the plants, but there they will remain so far as I am concerned. I cordially wish such a society success; but its efforts, me fears, must be educational rather than compulsory.

A SCOTTISH GARDENER.

The Pampas Grass (Gynerium argenteum)

The graceful plumes of the Pampas Grass, when well harvested and dried, have considerable value at the present season in decorative schemes. Yet it is rather surprising, when one looks around, how few people who know the plant grow it. The Pampas Grass is by no means difficult to grow, thriving, as it will do, in almost any kind of soil, even if that be of a poor and sandy description. By the sides of avenues, in shrubberies, or as isolated specimens on lawns, its feathery plumes show to much advantage, and when plants are established they require but little attention beyond an occasional top-dressing of leaf-mould or of manure during the winter. I enter my respectful protest against the practice followed by some florists of dyeing these plumes in various vivid colours—green, orange, crimson, and the like. The natural silvery-grey colour of the plumes is greatly to be preferred to any artificial hue which they are made, mistakenly, to assume.

A SCOTTISH GARDENER.

Jasminum rex flowering in the Royal Botanic Garden, Edinburgh

Beautiful autumn colouring of Michaelmas Daisies

Some Michaelmas Daisies, like Climax, after flowering, have been exceptionally beautiful for several weeks, the foliage and stems assuming a bright golden-yellow colour, adding very much to the autumn colouring in the garden, which has been so fine this season. I have never seen Aster foliage take on such a brilliant colour before. The plants are growing in a border with a north-east aspect.

Chrysanthemums of 30 years ago

Looking through my diary for 1900 I find a list of the Chrysanthemums which were grown in that year. Many of the varieties have now practically disappeared, and if a selection of the Chrysanthemums of that date may be deemed of interest it is here appended. Miss Alice Byron, Mons. C. Molin, Mrs. C. Bown, Mrs. Coombes, Western King, Viviand Morel, Mme. E. Fabre, Mme. C. Audiguier, Lady Hanham, Comte F. Lurani, William Seward, John Shrimpton, La Triomphante, Yellow La Triomphante, Louise, Vivid, Phœbus, Mrs. Greenfield, N.C.S. Jubilee, Chas. Davis, Chas. Longley, Mrs. Geo. Mileham, Souvenir de Petite Amie, Lord Salisbury, Soliel d'Octobre, Bronze Soliel, Source d'Or, Lizzie Adcock, Henry Perkins, Miss Mildred Ware, Miss Olive Miller, T. W. Pockett, F. S. Vallis, and George Penford. Doubtless there were others, but the varieties named were, for some reason which was not noted, specially mentioned. Of all the sorts given above the sole survivors, so far as I am concerned, are La Triomphante and its yellow form.

A SCOTTISH GARDENER.

Lilies after flowering

Japanese Lilies are frequently grown in pots and the open border. Their glorious flowers now being over, many amateurs are wondering how to make them flower well another year. The dead flowers should be cut away, but the stems and leaves allowed to remain as long as they are green. Give soot water once a week, but directly the leaves commence to turn yellow, withhold water entirely. Lay the pots on their sides in any dry, frost-proof shed until the time comes round to start the bulbs again in spring. Provided the soil is well drained, the bulbs in the open border may be left in the soil, but if the latter is wet and heavy the bulbs should be lifted and stored in boxes of sand or dry soil.

F. H.

Olearia Haastii, a hardy New Zealand shrub

Olearia Haastii

FLOWERS on hard-wooded things are so few in the late summer that one is all the more thankful for this good New Zealand shrub. It is the hardiest of its kind, coming from altitudes of from 4,000 feet to 5,000 feet, and is said to flourish even in the Orkney Islands. For several years it remains as a neat bush, well covered with bloom, rising later in rather more straggly form to anything from 8 feet to 10 feet. The one shown in the picture was planted about 15 years ago. It is one of the most satisfactory shrubs in London gardens. Its tenderer relation, O. Gunniana, cannot stand severe frost; it was killed to the grou
the late severe winter, and though i
grow again from the base, it means th
for two years of its pretty grey foliag
masses of little Daisy blooms in the
summer. Olearia macrodonta, grown
a little tree, was also killed down,
making good bushy growth from belo
is a fitful bloomer, only flowering freely
a hot summer.

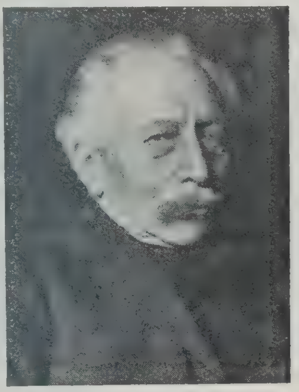
Memories and Plants

I.

“For some we loved, the loveliest and the best
That from his Vintage rolling Time hath prest
Have drunk their Cup a Round or two before
And one by one crept silently to rest.”

N the garden they live again.

William Bateson introduced many curious plants to Burford. One day he brought ' son, his god-child, a Lithops, a Stapelia, mosa pudica, and a piece of Tilandsia noides which ll hangs on rod in the ve where he ng it. The iegated Sanviera, leaf ttings of ich throw off eir white in, producing altogether een plant, ly-of-the alley with iped leaves, d the fas- nating sal- on-fringed eranium, a imæra which orts to an dinary Zonal Pelargonium, were amongst s contributions; to him we gave Begonia raf Zeppelin and the decorative Pelar- nium Pearl with its sport White Pearl. he ordinary garden plant, were it ever so re or so beautiful, left him cold, except here a brilliant mass affected him, as would e pure colour of a Japanese print or of an riental embroidery. In plant, in print, or in nbroidery he disliked shading.



William Bateson

William Rickatson Dykes was a most imulating teacher and the kindest of friends. urford is full of his plants. In addition to s Tulips, of which we have a large collec- on, there are the bearded Irises—I love armony best—the Juno Irises, Iris Wattii, olchicum montanum from Croatia, Anemone montana, Dietes spathacea, and the exquisite little Crocus, C. minimus. As these plants reach their apogee William Bateson and William Dykes live again.

William Rickatson Dykes

II.

Myrtle

“Sprig” is a delightful word which takes us back to the eighteen-seventies; rigged muslins, a sprig of Nobility, and a rig of Myrtle. All Victorian brides had a yrtle sprig in their bouquets, for is not yrtle sacred to Myrtilla, a Greek name for enus. Milton places Myrtle in the bower of ve, and Thomson compares “the lovely ung Lavinia” to a Myrtle which breathes its balmy fragrance o'er the ild.” Our Myrtles go back to my grandmother's wedding bouquet. A more modern plant commemorates Lord Lambourne, who, when Lady Lambourne died, always wore Myrtle in the place of the Malmaison.

III.

“ I sometimes think that never blows so red
The Rose as where some buried Cæsar bled;
That every Hyacinth the garden wears
Dropt in her lap from some once lovely Head.”

Omar Khayyam, it is reported, said to one of his pupils, “My tomb shall be in a spot where the north wind may scatter Roses over it,” and over his grave at Naishapur grows Rosa damascena, a cutting from which is trained on the shed in the Alpine Yard at Kew.

Lord Lambourne

Perhaps the most famous plant to be associated with a great man is Napoleon's Willow. Salix babylonica was introduced to St. Helena by General Beatson in 1810; this tree attracted Napoleon's attention, and he had a seat placed under it. In 1821 the tree was blown down, but Mme. Bertrand planted cuttings round Napoleon's grave. Cuttings were brought to England in 1823, when a plant was established in the garden of the Roebuck Tavern on Richmond Hill. The Kew cutting was struck in 1825 and grew into a tree, which was planted near the Main Gate. This, the Director tells me, is now dead, but Kew possesses trees which are direct descendants of the St. Helena plant, apparently, a male plant of the ordinary Weeping Willow. The members of the British Association when they visited St. Helena this year do not appear to have noticed a Weeping Willow, but I hope to have more information on this subject a little later on. Napoleon's Willow was planted all over London—1, Porchester Terrace; 2, Lee Place, Lewisham; Beaumont Square, Mile End; in my grandmother's garden at Ealing, and at Chatsworth.

Over the fountain of Vaucluse, in Provence, grows an ancient Briar from which, the story tells us, Petrarch plucked a Rose for Laura. We brought cuttings home, though the Rose does not appear to go back to 1337!

An authentic link with Linnæus is Sempervivum soboliferum, from the wall of the garden of Linnæus' house at Upsala, for does not Linnæus tell us of how he found it and planted it himself?

IV.

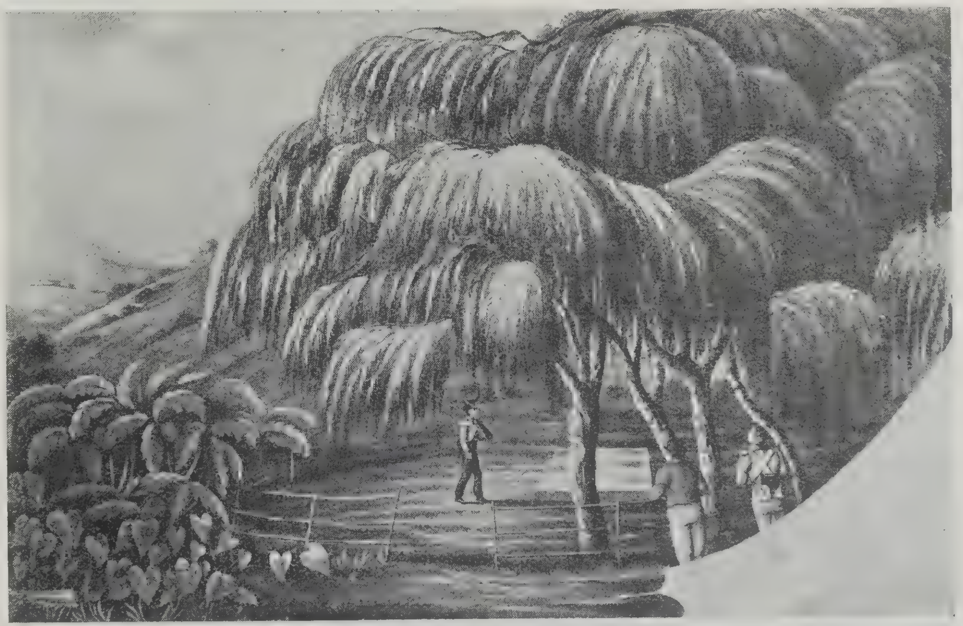
“ Lo! sweeten'd with the summer light
The full-juiced Apple, waxing over-mellow,
Drops in a silent autumn night,
All its allotted length of days,
The flower ripens in its place,
Ripens and fades, and falls, and hath no toil,
Fast-rooted in the fruitful soil.”

William Lawrence.

Japanese Maples

These plants form a wonderful and beautiful group, especially in the autumn. This year they have been glorious, and this, no doubt, is owing to the beautiful summer. Groups in the shrubbery border are very effective, and they also prove very suitable in the flower border. Their habit of growth is variable, and some of the smaller kinds are useful as isolated examples in the rock garden. In soil that is poor, growth is somewhat slow, but where the medium is good their growth is good, producing ample foliage which turns to glorious shades of colour in autumn. Some of the varieties retain their colour throughout the season.

F. H.



Napoleon's tomb at St. Helena, drawn on the spot by Capt. Marryatt, R.N., 1821

Napoleon was interred at his own request under some Willow trees near a spring of water, from which he daily sent for the water used at his table. Here he lay from May 8th, 1815, till October 15th, 1840, when his remains were removed to France. The Willow is Salix babylonica, the Weeping Willow

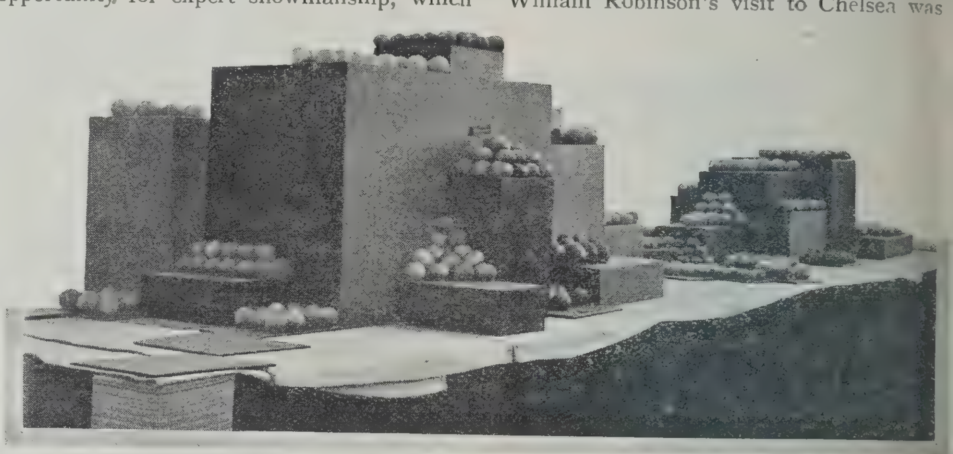
Achievemen

LOOKING back on the year's achievements in horticulture can be a very pleasant occupation, especially for the purposes of this now regular annual review, which encourages reflection upon some of the outstanding performances at shows, at trials, and in the propagation of new plants. In dealing with these horticultural high lights we brush aside for the nonce all consideration of failures and disappointments; these do not exist for us now that the year is closing, because this is also a time of looking forward. If there have been mistakes and failures we resolve not to repeat them—they are but stepping-stones in the pool of fame, upon which we have momentarily slipped—and where the report is all of progress and prosperity we shall regard this as but the harbinger of still finer prowess and of the best that is yet to be.

To march with the Daffodils and continue throughout the whole year's procession of big exhibitions of Irises, Roses, Dahlias, Carnations, and Chrysanthemums, Chelsea, York, Shrewsbury, Edinburgh, and Southport will not be expected of us; we take these big events and all that they signify of horticultural enterprise for granted, and long may they and their like flourish.

A symphony in blue

Mention must certainly be made, however, of the meritorious debut of the British Delphinium Society. It will stand out indelibly as a symphony in blue in the minds of those who rendered their homage to the flower at the R.H.S. Hall in July. It showed that masses of one genus can escape monotony, and, by skilful planning and grouping into a composite display, achieve a complete and satisfying harmony. Specialists like Blackmore and Langdon and Wm. Wells, who shared the premier honours, were given an opportunity for expert showmanship, which they utilised to the full. Among Rhododendron displays at the special show for these shrubs we recall Wallace's grand group of hardy varieties awarded the Rothschild Challenge Cup, and Gill's mammoth exhibit mounted as for a pageant of summer.



Bunyard's Apples. No dishes, no baskets

The scheme of this exhibit is obviously influenced by the cubist movement

A symphony in blue

Blackmore and Langdon's winning exhibit at the Delphinium Show

"Black" fruit

We remember with delight Bunyard's fine accomplishment with perfect Irises in a far from perfect season, to which were added a glorious group of Pæonies (we now talk of the Pæony as a coming flower), and t "break" in the exhibition of fruit in cubist setting completed a grand tri William Robinson's visit to Chelsea was many one of the big surprises of the show and his revised edition of "The Wild Garden" provided an additional reason fo adding his name to the scroll of this year' honours. The long services of G. W. Leal (R. H. Bath, Ltd.) to the Daffodil wer recognised by the award to him of the Pete Barr Memorial Cup—a most popular an thoroughly deserved honour. The Iri Society's third magnificent show found al the principals giving a very good account o themselves, but we would like to single ou Mrs. Dykes for the novel and most charmin display of her flowers. Her simple potter transfigured by harmonious hand-painte colours was an inspiration. It gives us distinct pleasure and a special sense of appropriateness to record her subsequent winnin of the Dykes Memorial Medal for Iri "Joyance."

A "close-up" of California

Mrs. Sherman Hoyt's extraordinarily vivic conception of Californian desert flora anc fauna and of the mighty Redwoods struck an entirely new note, and a slight tinge o sensationalism may be pardoned for the enterprise and skill with which it was so effectively staged.

A Dahlia garden

Another novel exhibit for which Cheal's received many congratulations was their display at the National Dahlia Show of assorted Dahlias planted in an undulating grassy mound on the floor. The restraint used here in planting was admirable, and every variety stood out in its full beauty. The galaxy of incomparable Star Dahlias has been augmented during the year by Bognor, a good bedding variety, bright rose-pink with crimson ring, Faygate, a very showy brilliant scarlet, and Margate, salmon-red suffused, tipped with rose, with yellow at base of florets. New large miniature Pæony sorts and Nagpur, a Camellia-flowered brilliant scarlet and a highly recommended variety, are promised for the coming season, as also

f the Year

their new dessert Apple King George V. ady Thornycroft x Cox's Orange Pippin), hich has the R.H.S. Award of Merit.

Further exhibits in London that we recall ith particular pleasure are Dalrymple's March group of Freesias in a variety of ew colours. The colours in his palette are mazing, but since nothing of the perfume is acrificed, only a churl will complain of the haste Freesia sporting in art shades.

ome new Alpines

Clarence Elliott, Ltd., made further notable ontributions to the flower garden in Leucocoryne ixoides odorata, Loassa acanthifolia, erbena corymbosa, and Tropæolum azureum, ll of which received the R.H.S. Award of Merit. Calceolaria Darwini was another interesting plant seen for the first time on their Gold Medal Rock Garden at Chelsea. Many ood performances by W. E. Th. Ingwersen nclude his re-introduction into cultivation of he rare Jankæa Heldreichii, Fritillaria uichiardii, Ramondias Nathalie and erbica, Ranunculus crenatus—a very fine orm from Mt. Kopravnick—and the scarce nd beautiful R. brevifolius, from the very ummit of Mt. Olympus. Other treasures ollected from the Near East which will require working up include the rare and lovely each-blossom coloured form of the true axifraga scardica.

Autumn glory

At the final Autumn Show among many ood things probably the most interesting pectacle was Mr. Lionel de Rothschild's Gold Medal group of young trees and boughs f a hundred berried and other shrubs. Here was an exhibit that drew everybody like a magnet. Autumn kept high festival in the Hall that day by this abundantly rich outpouring of her russet and ruby vintage. The ornucopia was no less lavish in the monumental display of Mr. Vicary Gibbs, whose every exhibit is an achievement in itself. Mr. Edwin Beckett, we understand, collected his ooth Gold Medal during the year.

The close of the year saw yet another Society launched, for which we predict a big uture. This was the Alpine Garden Society, oreshadowed in our pages earlier in the ear, and there are already signs of widespread interest in its development. Some enthusiasts are, even at this stage, bold enough to prophesy a boom in Alpines. In year of slumps one hesitates to hazard an opinion, but an auspicious start has been made, and a big advance in the New Year s assured.

pecial distinctions, awards, and novelties

The " Clay " Cup competition for a new Rose with the true Rose scent is always keenly contested, and the coveted trophy this ear was captured by B. R. Cant and Sons' Aroma. Their beautiful single Rose, Senorita d'Alvarez, satiny salmon-pink, with canary-yellow base, was a star at the New Roses Show of the National Rose Society, and received a Certificate of Merit. They exhibited Roses at nearly 50 shows and secured many irst prizes, gold medals, and silver cups, including the Ipswich Cup (for the second successive year) and the Canterbury Cup. The Gold Medal novelties of Alex. Dickson and Son, Gladys Benskin and Aureate, seen at the summer show of the N.R.S., were prominent among the Rose successes of the season. Golden Dawn, a vigorous yellow hybrid tea, distributed by D. Prior and Son, Ltd., and which they regard as the most outstanding introduction among yellows for many years, secured an Award of Merit at the Autumn Show of the society. This firm's dwarf Polyantha, Jack Hobbs, which had already received the R.H.S. Certificate, was granted a similar award at the International Test Gardens, Portland, Oregon, after a two-years' trial. The Rose is velvety orange-scarlet, with picotee edge, semi-double, and perpetual flowering. The Wigan Cup for autumn shown Roses, another much-desired trophy, this time went north to Th. Robinson and Son, of Nottingham.

Another jubilee

Dobbie's Sweet Peas lifted Gold Medals in London and Norwich, and, for the third time in succession, the Eastbourne Cup at the National Sweet Pea Show. We are glad of this opportunity and we know that readers will join with us in conveying heartiest congratulations to Mr. William Cuthbertson, who this year celebrates his jubilee with the enterprising and popular house of Dobbie and Co. Over 20 new Roses competed for the Nickerson Cup at the N.R.S. summer show, Dobbie's Duchess of Atholl being the winner. The R.H.S. also gave it an Award of Merit. The Abol Challenge Trophy at the Royal Caledonian (Edinburgh) Show is offered for an exhibit demonstrating the greatest post-war advance in any one family of horticultural species. This high honour was bestowed on the new Orchid-flowered Dahlias shown by Dobbie's. Further success among Potatoes was represented by their twelfth Gold Medal from the R.H.S. at the Autumn Vegetable Show.

Jankæa Heldreichii, re-introduced from Mt. Olympus

To enumerate the long list of Kelway's successes and novelties would exceed the limits of our space. Gold Medals at the Royal Cornwall, York Gala, Cheltenham Floral, Royal Welsh, Shrewsbury, and Southport are a few of their distinctions for Gladioli, Pæonies, and herbaceous plants Various of these have been selected for trial at Wisley. Among a host of good things we ought to mention at least the following three: Antirrhinum Kelway's Volcano, which has been described as the most brilliant of all Snapdragons, is of a pure self-colour, bright rich scarlet, and of vivid flame-colour in sunlight, and promises to achieve a wide popularity; His Majesty Pæony is a wonderful new colour in these flowers, having incurved outer petals of richest maroon-crimson, surrounding scarlet central petals with bronze-yellow reflexes—a most attractive and distinctive variety; Kelway's Lovely is a grand semi-double Delphinium of a delicate milky lavender and sky-blue with large white eye, and is one of the largest-flowered Delphiniums yet raised.

Two outstanding Delphiniums are among the year's achievements of Hewitt and Co., Ltd. Pompadour, granted the Award of Merit at the Delphinium Show, has a tall, imposing spike of spiral habit, the inner petals being gentian blue with a buff eye, the whole tinted with paler blue; this had a very good press. Hewitt's Superb, a 6-feet grower, was selected for trial at Wisley. This has perfect semi-double flowers of pale-blue suffused pink, with cinnamon eye.

A new race of Dahlias

A very considerable array of novelties in all departments is to be accredited to Unwin's, of Histon, and of special interest is the new and valuable race of dwarf bedding Hybrid Dahlias, which, by their easy cultivation and effectiveness, may be said to raise Dahlias to the level of popular half-hardy annuals. Seed of these is offered for the first time. Growth rarely exceeds 2 feet; they are early, very free, seldom require staking, and their delightful range of colours makes them a decided acquisition for July bedding. Principal awards for their Gladioli were a Gold Medal and many first prizes at the R.H.S. Gladiolus exhibition, large Gold Medal and Championship Silver Trophy (for the second year) at the British Gladiolus Society's Show, and large Gold Medals at Southport (fifth successive year), Shrewsbury, and Leicester.

Special Chrysanthemum successes were those of H. J. Jones', Ryecroft Nurseries, three Gold Medals with successive exhibits at the R.H.S. and the Gold Medal group of Keith Luxford at the National Chrysanthemum Show, which included a sterling novelty and First Class Certificated buff exhibition flower in Rise of Day. The Melba, a primrose-yellow sport from the popular Japanese exhibition variety Louisa Pockett, and Friendly Rival, the deepest of yellow incurving varieties, will be distributed in February. H. Shoesmith, with his usual consistency, brought many good introductions before the judges and collected no less than Awards of Merit for 14 of them.

W. H. Simpson and Sons, the originators of numerous Antirrhinums of distinction will distribute four of the year's special successes next season. Chief among these is C. H. Herbert, a very robust, pure old gold, large-pipped variety spoken very well of by the Park superintendents who have been trying it out; selected for trial at Wisley it received there the Award of Merit. Others are Huntsman, a tall, self-scarlet sport from R. F. Felton, and White Wings, which can be recommended to admirers of tall whites with a close-set spike. R.H.S. Awards of Merit were gained by their short-jointed, free-cropping early Tomato Radio, Cauliflower All-the-Year-Round (an early, medium, and late cropper), Lettuce Continuity, and Dwarf Bean Canadian Wonder Improved (First Class Certificate in trials under glass).

At the Lupin trials of the R.H.S. we believe that they headed the list by obtaining awards for Exquisite, Northern King, Highlander, and Etna, and eight varieties Highly Commended. Isaac House and Son are still persevering with their excellent strain of Scabiosa caucasica, and several novelties are announced. Their Pentstemon heterophyllus True Blue and the Blue Pimpernel Anagallis Moselli Vilmoriniana took the fancy of many at Chelsea. The Gold Medal for Sweet Peas at Chelsea was awarded to the monster grand group of R. Bolton and Sons, who followed up this success by Gold Medals at Harrogate, Ipswich, and Saffron Walden.

There may not be anything spectacular about Toogood and Sons' achievements this year, but they are of a solid and eminently practical nature all the same, and consist chiefly of improved vegetables, like Roscoff Early Broccoli, Blood Royal (Globe) Beet, Toogood's Early Market Forcing Lettuce (under glass only), Early French Breakfast Radish, and Cauliflower All Seasons. Their Viola Avalanche is a pure white, coming true from seed, a compact plant and first-class variety for bedding.

Blackmore and Langdon began the year well with a Gold Medal for their January display of Cyclamen persicum at the R.H.S., and in addition to their triumph of three first prizes in the three principal classes at the Delphinium Show, F.C.C.'s for Blue Gown, Lady Bath, Lady Emslie Carr, and Lady Eleanor, A.M.'s for Mrs. Paul Nelke and Lady Elizabeth; their Delphiniums obtained two R.H.S. Gold Medals and first prize at the Royal Harrogate; their Begonias R.H.S. Gold Medal and Silver Cup, large Gold Medals at Shrewsbury and Southport, first prizes at York Gala and Harrogate, and Award of Merit for Mrs. Raeburn Mann.

After creating a sensation among the Poets here, Mr. F. A. Secrett exhibited at the International Daffodil Show in Holland for the first time the Award of Merit Poeticus ornatus varieties Red Rim and Wide Wing, and obtained similar awards there, as also for the bright red-cupped Incomparabilis Naomi and that fine Barri J. K. Ramsbottom. Huon, a very early Poet; Edgar Thurston, a very early yellow Trumpet (selected for trial at Wisley); Finality, a Poet Narcissus; and May Glory all obtained R.H.S. Awards of Merit. The last two named secured this distinction at Chelsea, and are, therefore, among the very latest to flower.

Among other British bulb successes were those of The Welsh Bulb Fields who, at Haarlem, secured awards for six varieties of their own raising. Gold Medals were gained at the Midland (in addition to awards for Daffodils Mrs. Watts and Jorrocks) and at the Royal Botanical, Manchester.

One looked to Ernest Ballard for special novelties among Michaelmas Daisies and was not disappointed. His new-comers are the early-flowering Pink Pearl, a large, beautifully fringed, delicate pink, with broad rays and small eye, and Snow Sprite, a very dwarf mid-season Nova-Belgii, of branching habit, flowering freely down to the ground, and blooms semi-double white.

The all-round excellence and keenest rivalry among the trade Carnation exhibits is reflected in the Gold Medals awarded at the British Carnation Society's Show in November to C. Engelmann, Stuart Low, and Allwood Brothers. The "Daily Mail" Gold Cup for the best scented Carnation again went to Mavis, raised by Walter Hemus, Ltd.

Several new plants of special interest have been offered by Gavin Jones, among which were noted Rosa Damascena, the Rose of Omar Khayyam; Papaver Phenomenal, a remarkable oriental; Echinacea Letchworth, a striking blood-crimson cone flower; Clematis macropetala from China; Aquilegia fragrans, introduced by him through seed from Kashmir, Centaurea stricta, found in the Alps; Dagenophora montana, a composite from Tasmania; Ononis cenisia, a choice and scarce Rest Harrow; Tunica Saxifraga fl. rosea pl., a prostrate and dainty treasure raised at Letchworth.

Chelsea rock

Of "Chelsea" one could hark back to so much according to individual preferences, but amid the many examples generally admired or worthily judged as typical pieces of the real "Chelsea" one must pay a tribute to Gavin Jones for his intrepidity among the "rocks." It was greatly daring of him to experiment in an entirely new métier, and whether you liked it or not you could not help but feel that you were in the presence of a masterpiece, and we hope that more such innovations are in store for us on the rock embankments of the future. Whitelegg's "best yet," a typical piece of work, made a grand foil to it.

Sutton's display of annuals was on a still more grand and prodigal scale, and once again outdistanced all rivals for Chelsea's Blue Riband, the Sherwood Cup.

Sutton's big year

Sutton and Sons' "bag" of Gold Medals for 1929, in addition to the Sherwood Cup and Gold Medal for the third time in nine years, was 14 for Sweet Peas, five for annuals and other flowers, 10 for vegetables, and three for Potatoes. At the R.H.S. Vegetable Show customer exhibitors of the produce of Sutton's seeds scored amazingly with 32 out of 35 first prizes, the R.H.S. Challenge Cup, the Sutton Cup, and 1st 2nd, and 3rd prizes, Silver Cup and 1st, 2nd, and 3rd prizes, and many other successes.

Carter's grand group of Sweet Peas and florists' flowers was, as usual, one of the outstanding exhibits at Chelsea and obtained the Gold Medal. Many other awards were obtained throughout the country, notable among these being the Gold Medal of the National Sweet Pea Society for Flaming June, and the R.H.S. of Ireland's Award of Merit for their "Fruit" Tomato.

Laxton's new Apple Epicure (Cox's Orange x Wealthy) which was reserved for the Bunyard Cup for the best new seedling Apple last year, had this award confirmed last October. Advance, an early red dessert, is another good novelty of high colour with the Cox's flavour. A new Plum, said to be the earliest with the Greengage flavour, Blue Tit (Czar x Greengage), is self-fertile and a heavy cropper.

Among the amateurs

A word must be said for the amateurs, who really need an issue to themselves for us to do anything like justice to their performances, which, in Orchids, Irises, Carnations, and other classes, compare very favourably with the best work of the professionals Many hundreds of successful exhibitors i all parts of the country were recipients o the GARDENING ILLUSTRATED Medal, which i offered yearly as a first prize at most o the principal shows. We again have to congratulate Mr. G. L. Pilkington for hi achievement of the Runciman Challenge Cu award for the best exhibit of an amateur a the Iris Society's Show, in addition to th Silver Medal of the American Iris Society To Mr. W. J. Caparne and Mr. Frank Gals worthy we pay our tribute for their remarkable collections of flower paintings at thi show. Mr. W. B. Cranfield has dominate in Ferns, and at Southport collected th chief trophy and most of the first prizes i this class. Viscount Hambleden was th Sutton Cup winner at the Autumn Vegetabl Show. At the Orchids Show Mr. F. J. Hanbury secured the Gold Medal and Silve Challenge Cup presented by Baron Schroder and for his group Mr. R. Paterson won th Orchids Challenge Cup. Lord Howard d Walden's Cup at the Carnation Show, a well as Stuart Low's Novelty Cup, went t Lady Emslie Carr. The Reginald Cory Cu for 100 blooms was awarded to Mr. Samue Wallrock.

Lady Aberconway and the Hon. H. D McLaren, whose exhibits, large or small, are always distinguished, gave of their best in their display group of uncommon plants and shrubs at Chelsea. A Gold Medal was awarded this, one of the choicest delights o the show. And so we might go on ad infinitum. As we single out a few successes as they have come at random into the mind, we are conscious of our injustice to numerous equally worthy accomplishments which fickle memory has slighted. We must leave our readers in a mood of reminiscence, as they themselves pass the year in review and fill in the gaps according to their own judgment, because the year's horticultural round is seen from almost as many points of the compass as there are points of view, and even as "many a flower is born to blush unseen," so countless meritorious performances among flowers, fruit, and vegetables must necessarily go unhonoured and unsung.

RUSLIN LIEVES.

Endive

In the preparation of winter salads some good Endive is indispensable, and for use in late autumn and winter requires protection from frost. The best way is to lift and plant in cold frames. This operation should be carried out not later than the third week in October. Place the plants moderately thick together in any fairly good garden soil, taking care to lift the plants with as good balls as possible. The soil at this season being quite moist, no water will be required. As damp is the greatest enemy to Endive in frames, the leaves must be kept as dry as possible by giving air on all favourable occasions. When the weather is very damp or showery, the lights must be kept over the plants, but propped up with a large flowerpot at the back. On fine days remove the lights entirely, but replace them in the evening. When frost prevails the lights and also the frame must be well protected by any covering material that is handy. F. H.

Seakale and Chicory

Roots of these should be prepared and planted in borders or deep boxes in the Mushroom house or other warm house where it can be kept in the dark. If the plants are dewed over occasionally the results will be more satisfactory; it must, however, be in the form of a light mist.

Anticipation

By T. Hay, M V.O , V.M.H., Superintendent, Hyde Park

HIS word was no sooner written than I vas assailed by an uneasy feeling that it night have a more subtle and compre- nve interpretation than is generally given ; I then consulted the dictionary, and ry be confessed here that my bookshelf eak in dictionaries. The first one re- rl to was entitled " A Concise Pocket onary, price 1s. 6d." Here the meaning r title was given as " to anticipate; a aste "—a rendering which was of little In these days of high prices no doubt s a mistake to expect much for a miser- ighteenpence.

tionary No. 2 purported to be " A Com- Dictionary and Companion for the ," price not stated, and although a much bulky volume, strange to say the same words given in Dictionary No. 1 were repeated. Plagiarism is evidently ram- among dictionary compilers.

then paid a visit to the local Public ary, and here one might revel in dic- ries and reference books literally by the At my request the courteous attendant ed me the redoubtable " Webster." e, as I expected, " Anticipation " had y a whole coloum all to itself, embel- d with quotations from the poets and ics. It also provided the exact value of vord in every department of knowledge. ng a multitude of other synonyms and itions it may mean " foresight," " prior eption, " intuitive prevision," " appre- ion," " forestalling," " a previous im- sion," etc., etc., and, most curious of all, title has a legal significance—this being as " expectations under a will."

make short, then, what might well be ng story, the word " anticipation " as here simply means a consideration of things as may give pleasure and interest e near future, but readers who prefer the rendering, that is, " expectations under ll, are quite entitled to have it, and the is here expressed that all their expecta- may be speedily realised.

e all know how entangling a subject ny can be, particularly when it comes to naming of plants, but I am now con- ed that it is simplicity itself when com- d to the possibilities of our everyday uage.

rdeners are busy people, and when the ogues arrive they prefer those which con- on page one the names of all plants new ncommon. There is little amusement in ng through from " Abutilon " to gopetalum " in the mere hope of finding ffer of a golden yellow Sweet Pea, a rose- red form of Romneya Coulteri, or a blue ia. There should be some advantage in having brought together some news e plants that may be expected to interest delight us in 1930, and the plants ioned here may be additional to the good provided by our many enterprising hardy merchants.

ide of place must be given to the new nopsis—M. regia—from Nepal, which been fully described in the September of the " Journal of Botany " by Mr. aylor. It has all the appearance of being eat addition to this fascinating and popu- genus. M. regia, even without flowers, be a lovely plant. Its affinity is with uperba, but the flowers are yellow, while of M. superba are white. It is probable from the Nepal collection of seeds there be a second new species of Meconopsis, his the botanists will decide.

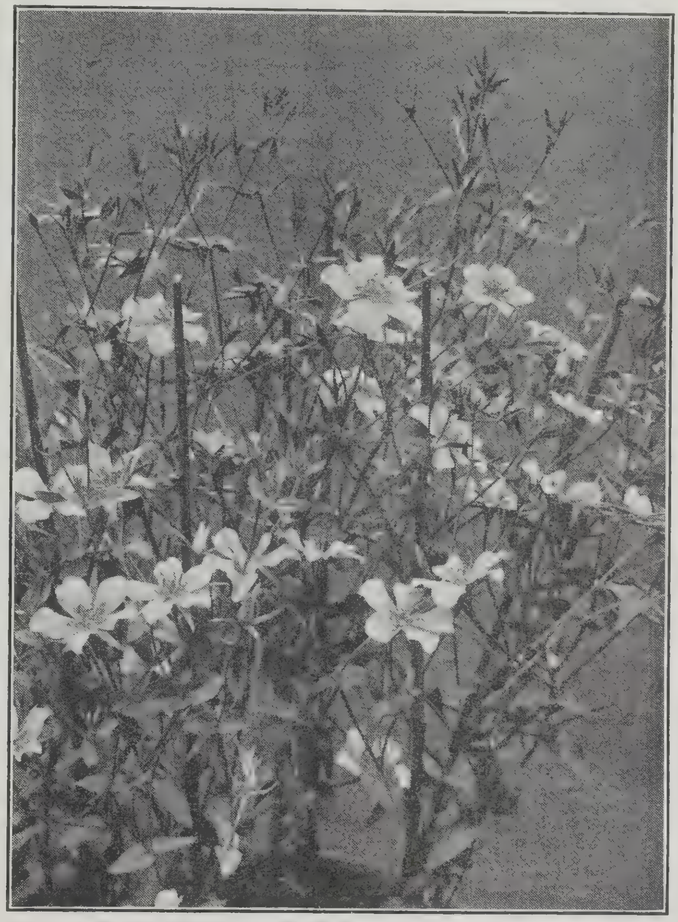
e Gentiana ornata of Wallich has been raised successfully. It is a plant new to cultivation, but it has arrived too late to carry its great name with dignity, as it will not compare in beauty with its Chinese cousin, nor with the peerless G. Farreri, but this Nepal Gentian will be a very pretty companion to both of these famous species. Gentiana Kurroo—the true plant—has also been raised in quantity and will soon be much more plentiful than it has been for many years.

Of the Nepal Primulas raised there may be one or more that are new to gardens, and if not, there will be an increase of stock of some that are never too plentiful.

Among other interesting Cape plants that may reasonably be expected to blossom in the coming season is Aristea capitata. It is many years since this plant has flowered here, and few of us have seen its long, arching wands of gentian-blue flowers.

We may also hope to see Gerbera asplenifolia and several other additions to the Cape composites. Caryopteris Wallichiana has germinated in plenty, and the dried specimens of this plant give good reason to hope that it will be as fine as any, if not the best member of this attractive family.

There is a splendid sheet of specimens at South Kensington of Mutisia subulata, a bright scarlet-flowered species, and plants are now of good size in several gardens. The recent arrival of living plants of this species direct from Chili makes this a certainty in 1930.



Sabbatia campestris

A half-hardy annual that has come to stay. Native of Arkansas and the Red River, it inhabits the open prairies, spangling them with bright pink star-shaped flowers with clear yellow centres

From Nepal and Kashmir have come two Morinas, M. Coulteriana, which has yellow flowers, and M. polyphylla, a dainty, pretty species very rarely seen in gardens.

Paraquilegia cæspitosa—the Isopyrum of some authors—looks happy in a young state, and may prove a nice addition to the rock garden.

Anemone tetrasepala is said to be a first-class species, and this, it is hoped, will be of sufficient strength to flower in 1930.

Many more interesting Himalayan plants will also show their merits and faults at an early date.

The Cape Anemone—A. Capensis—is at last here and in fine, healthy, vigorous specimens. This is said to be one of the finest of Anemones, and is beautifully figured in " A Book of South African Flowers," by Messrs. Bolus, Barclay, and Steer.

There are strong clumps of Campanula rupestris to be seen up and down the land. Farrer praises this species highly. It is one of which a good deal is expected.

The present year has proved rich in the production of new or forgotten Pentstemon species, as the Award List of the R.H.S. will show, and 1930 should give us several species that promise well from their botanical descriptions in the floras. If Lagotis glauca is half as pretty an Alpine as Royle's picture declares it to be, it will be a gem. The same may be said of Primula macrophylla, which is now with us in plenty.

The charms of Sabbatia campestris have already been appreciated in spite of its slow growth and trouble during its infancy. We may hope that S. dodecandra and S. angularis will be more easy : they are both said to be showy plants, and both species have

REMINDERS FOR THE WEEK

Southern and Midland

Lawns

Give lawns and grass paths a hard sweeping now that all leaves have fallen, in readiness for their annual dressing, which may consist of fine soil, wood ash, soot, and on grass inclined to be mossy add freshly slaked lime. Soil which has been discarded from potting will answer, providing a percentage of freshly-chopped loam is added to it. The whole should be passed through a ¾-inch sieve and be mixed as follows: 1 cart-load of soil (or 12 barrow-loads), 4 barrows of wood ash, 1 bushel each of soot and lime. Mix thoroughly and apply to the lawns with an even spread, which should average ½ inch to ¾ inch in depth. Previous to its application, however, the lawn should receive a surface dressing of sulphate of ammonia at the rate of 2 ozs. to each sq. yard; this will effect a vast improvement upon impoverished lawns, which will prove conspicuous immediately the grass begins to grow in spring.

Shrubs

Azalea and Rhododendron beds and those of other shrubs are in need of attention at this season as they usually become collecting stations for all kinds of drifting leaves, in addition to their own. Lilies are often planted freely in beds of the former, for which reason it is not advisable to dig among them even in the lightest form; something, however, must be done to improve their appearance, especially those bordering lawns, and to prevent their leaves from dispersing all over the place. The best method is that of scattering surplus soil over the surface of the leaves, as this not only keeps them in place, but hastens their decay to the great benefit of the shrubs and Lilies and leaves the beds presentable.

Crocus and Snowdrops

These do remarkably well beneath Azaleas, and a top dressing such as that described above improves them considerably.

Cutting flowers

Sprays of Winter Sweet (Chimonanthus fragrans), Jasminum nudiflorum, and similar winter-blooming flowers if cut and placed in a cool room whilst in the advanced bud stage open their flowers beautifully, and when secured in this way prevent disappointment, as the fully expanded blooms are destroyed in a single night.

Bare spaces

The foreground of trees and shrubs retained for the purpose of growing masses of annuals and other flowers should now be dressed with a little manure and deeply dug in order that such may be worked by frost and thereby cleansed somewhat, and those spaces now occupied with autumn-sown annuals should be given an occasional dusting of soot as a check to slugs.

Gooseberries

Keep a sharp watch on these from this date as birds often play havoc with their buds about this time of the year, just as they do with Forsythias and Prunus Pissardii before one realizes what is happening. Should attacks commence, the bushes should be sprayed with a bitter substance, such as Quassia Extract, and repeated if the attacks persist.

Digging, trenching, and manuring

This work is more or less constant in the kitchen garden now, but during inclement weather roots in store must be sorted, and, where not already done, the seed of the various kinds of Potatoes and Artichokes must be selected and laid out thinly on shelves where they may green and harden. Early kinds of Potatoes intended for forcing must be placed in a warm house to sprout; it will be advisable to keep them away from the glass.

Perpetual flowering Carnations

If these have been well and strongly grown they will not only sustain themselves through the many dull, dark days of the coming month, but will produce a good display of flowers. A cool, fresh, buoyant atmosphere must be the order, a crack of air being left on most of the time, always remembering that a close, humid house will favour the development of disease. Secure nice healthy cuttings when available, and thereby obtain a few good early plants for blooming in large pots.

Arum Lilies

Plants now developing flower spikes will appreciate a little feeding, either of liquid or artificial manure, as these take a lot out of the plants; it is also well to bear in mind that in Nature is a water plant, therefore do not allow the plants to suffer from want of moisture at any time during growth.

Strawberries for forcing

These should be plunged in ashes up to the rims of their pots in cold frames without delay, as failure to do so will result in a lot of split pots. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Daffodils in pots

If these were potted at the time advised in these notes, the pots will now be well filled with roots and the tops should be making a little growth, in which case it is advisable to have them removed from the "plunge" and set in a cold frame. That is, of course, if the weather be mild and open. For the first two or three days a mat should be thrown over the lights, but later all light possible and a little air should be given. At the end of a fortnight place the pots of bulbs in a slightly heated pit or greenhouse.

Do not force unduly

On no account employ strong heat for these Daffodils, especially at first, or the chances are the flower-stems will never appear. While the soil must never get really dry, it is bad for this plant to keep it constantly sodden from frequent applications of water. A light, airy structure will give flowers of fine colour and substance.

Early vineries

Where fairly early ripe fruit is desired it will now be necessary to close the ventilators, providing, of course, that the Vines have been pruned and dressed and the house cleaned. It is wrong to start away with a high temperature, a gentle warmth of 45 degs. to 50 degs. being ample for the first fortnight or so. Well damp floors, etc., so as to maintain a nice genial atmosphere in the house. Beware of dryness at the roots, but, at the same time, do not constantly saturate the soil.

Manuring and digging

With the long-continued wet of the present autumn and winter these important jobs have been sadly hindered, and it is seldom that I have seen so little of the soil turned up at this season. It will be necessary, therefore, to take full advantage of any favourable sp
get arrears worked off.

Fruit trees on walls

The necessary pruning of these and
fastening to the walls should, if the we
be reasonably mild, be carried out. I
walls are properly wired the fastening is
an easy and expeditious matter, but w
the old-fashioned nailing is still in vogu
work is both slow and tedious, and in r
cold weather almost impossible of b
carried out.

During inclement weather

There are many days during our w
season when it is impossible for the ou
staffs to stand out, so advantage shoul
taken at such times to get various item
through that might otherwise be left
until they were urgently required, when r
valuable time would be lost putting the
rights. Tools of all kinds should be cle
and closely examined to see that they a
good working order. Such things as wo
rakes should be re-toothed where neces
lawn-mowers thoroughly cleaned and
and, if not working properly, sent to
maker for overhaul.

What may be made

Provided with a saw, square, and ham
with, of course, suitable wood and nails,
handy man can soon put together the n
sary number of cutting-boxes, and also r
old ones where necessary. Wooden t
are very cheap, but with a good plane
soft, clean wood, it is easy to turn out r
bers of these of various sizes. Birch be
are always in demand about a garden,
quantity of these should also be made.

Other necessary items

Stakes of all kinds should be sorted
tied in suitable bundles, and any requirin
be repointed attended to in this respect.
saves much time when staking is in
swing. Wheelbarrows look much better
do not get sodden if left out if given a c
of coats of paint.

The seed order

The annual deluge of seed-lists has be
and the sooner one gets going among t
selecting the various items it is intende
grow in the coming season, the better it
be for all concerned. Early ordering en
everything ordered being received, wh
also ensures that all seeds are at hand
the time comes for sowing, and it will
be a short time until several kinds have
got in. The seedsman will, also, bless
early "orderer." C. BLA

Preston House Gardens, Linlithgow.

Jasione humilis

The Jasiones are not greatly prized by t
who crave after rare or exceedingly c
rock plants, yet in most rock gardens of
size there are places where a good pla
Jasione humilis—one of the best of the d
species—may be accommodated with
vantage. It has been well said that
Jasiones aim at being Globularias, but
are short of attaining that goal, nor are
Phyteumas, but occupy a place between
two. This species, which is only abo
inches in height, is a neat little plant
many heads of pretty blue flowers prod
in summer. J. humilis is quite hardy,
may be raised from seeds or propagate
division. S. ARNOT

ardening Illustrated 50 years ago

When We Were Very Young

Are old fruit trees worth saving?

MY experience leads me to say
"Never cut down an old tree
unless it is quite dead." I have
any large old fruit trees, of which
me twenty or thirty were trans-
anted twenty years ago. All of them
ere grafted with other sorts of
pples, and, with the exception of one,
hich died, all are doing well, and are
ne trees. I have also several espalier
pple trees, some of which are a hun-
ed years old, and, having been
afted afresh, have done well,
pecially one, an old Pomme Roy.
his tree having exhibited symptons of
cay, and having also become afflicted
ith American blight, was, some seven
eight years ago, grafted in two
aces, an operation which has given
so much new life and vigour that
st season it bore twelve bushels of
pples of the Pomme Roy kind, and
ne bushel on the grafts, and this from
n espalier more than a hundred years
d! Therefore, an orchard of old trees
ight be kept for many generations in
ill flourishing and fruiting condition,
erely by fresh grafting any trees that
ow symptons of decay. The new grafts
ut into the old tree have grown with
much vigour that three faggots have
en removed, yet the space out of
hich they were cut is hardly visible.
e do not, however, as a rule, prune
pple trees here; on the contrary, all
ings are permitted to grow as they
ill. The old tree of which I more
rticularly speak is 60 feet in height,
vering the walk, arbour-like, and
nning its branches through the ever-
een shrubs on both sides. On other
d trees here the grafts grew quite as
gorously as on the one just alluded to,
t they have been partly shortened.
R. W., *Reading.*

Woodcut from the first volume of "Gardening Illustrated"

Rare trees and shrubs at Wimborne

ave received a copy of a catalogue of
and shrubs from W. J. Marchant, of
er's Hill Nursery, Stapehill, Wimborne.
more than a catalogue, it is a work of
nce of 88 pages, and is a model of cor-
omenclature, spelling, and descriptions,
from a most interesting collection of
nd uncommon plants.

s firm is a young one, and has done
ers in the short time it has been in
ess.

ke the genus Berberis. Over 110
s, varieties, and hybrids are listed, and
careful study of this genus has resulted
e plants being true to name. Over 50
easters are listed, and their autumn
y in foliage and berry is emphasised and
ciated. There is a good collection of
species. The Prunus and Pyrus sections.
oth have been very carefully classified,
grown in quantity here. The rarer
include Acer nikoense, A. Sieboldian-
Anopteris glandulosa, Banksia quercifolia, the true Berberis Sieboldii Boldoa fragrans, Fothergillas, Eucryphias, a fine collection of Gaultherias. But why go on mentioning names when you can obtain a copy of the catalogue? It is free, but I would gladly pay for it, as surely it is far too good a list to distribute broadcast.

After studying the list I was determined to pay the nurseries a visit, and did so, and found an afternoon with the proprietor all too short. Mr. Marchant was up to his neck lifting and despatching orders, but very kindly put himself at my disposal and showed me his stock—he is a real plant-lover, and knows his plants, and ever ready to learn and to teach. I felt ashamed at having taken up so much of his time and got so much information out of him and at the end of it bought so few plants in return, but my garden is tiny and full to its limit. What struck me about the place was the health of the plants. I found the ground is trenched 3 feet, is of a light nature, and there is abundant leafmould on the place. The plants lift from the open ground with a mass of fibrous roots.

The rarer plants are grown in pots and kept plunged in frames which are shaded in very hot weather by laths.

The Prunus and Pyrus have made fine growth in spite of the intense and prolonged drought; thorough cultivation has proved its value there this past summer. The stock of Prunus subhirtella autumnalis is a very large one, and all plants are on their own roots.

I came away amazed at Mr. Marchant's knowledge and his skill as a propagator, and I think when the second catalogue is printed there will be a good many more items included of still rarer plants, as there were hundreds of pots of seeds of rare things from all over the world which in time will, I hope, be available to our gardens. F. D. T.

Ranunculus nyssanus

It is now a good number of years since I first grew Ranunculus nyssanus. It is still little known in gardens, and does not even find a place in many large and fairly complete works of reference, although offered in some catalogues. It is, however, described in Farrer's "The English Rock Garden," as "a handsome thing." It is of running habit, and, if left alone, will soon cover a good space, but it must not be allowed to trail among smaller choice plants. It has hairy, fur-like leaves, above which are borne the flowers on 1 foot high stems in May. These are of a golden yellow, and are quite good in their way, although some consider the blooms are too like those of our native R. acris. R. nyssanus seems rather indifferent to sun or shade, moisture or dry soil, but evidently grows and flowers better in a moist place with a little shade, and is increased by division.

S. ARNOTT.

Overhaul roots in store

The various root crops stored for the win
should have an occasional look over,
showing the least sign of decay being
moved. Seed Potatoes should also be gi
attention, as should Apples and Pears in
fruit room.

Planting Apples

tical advice—Pitfalls to avoid and
e importance of correct labelling.

E notes given below are, in the main,
attempt to answer several corre-
ondents who have written to us on the
subject, and while we are not going to
vith the actual planting operations,
of the points discussed should serve a
purpose.

e first place, we would ask the planter
d the reply given to "Experimenter"
November 16th issue of GARDENING
RATED upon the question of Apple
, because the choice of the correct
for the purpose in view seems to be
e game.

OF TREE TO PLANT.—This question
be answered without taking into con-
ion local conditions. Standard and
andard trees are the types to use for
ng in grass. They are slow to come
earing, but on reaching maturity large
for many years can be expected. The
mistake is to plant this type too closely.
planted at 10 feet to 12 feet apart the
ook to have plenty of room, but in ten
he trees require thinning, and another
e is then often committed by attempt-
keep the trees within the space avail-
y drastic pruning. Such treatment re-
in more growth and unfruitful trees.
y-five feet to 40 feet apart, according
iety, is the correct distance to plant
pe of tree.

the open garden, bush trees are the
l type in use, although in large estab-
nts half-standards are often per-
le. If bush type trees are used see that
es have a clean stem 2 feet in height.
istance apart of planting must vary,
ane's Prince Albert on Malling No. 1
requires at most 12 feet; Bramley's
ng on the same stock requires at least
that distance. In very small gardens
-trained trees are undoubtedly the
plant. Walls or fences clothed with
trees give excellent results, and no
is too small for this class of tree.
ees should be planted 2 feet apart and
angle of 45 degs. At this angle a
r length of stem can be obtained on a
height of wall or fence, and, what is
nore important, the lower buds of the
break better.

IETIES TO PLANT.—This is a very vexed
on and one about which few are agreed.
st gardens the real problem is to pro-
supply of fruit for kitchen and dessert
s long a period as possible. Even this
so straightforward as it would appear;
the problem could be solved by sitting
with a catalogue and selecting a good
so that the period August to the fol-
June was covered. If this were done
would be some years in which some
s would be Appleless because all varie-
not crop every year. The best re-
re got by choosing enough varieties of
consistent croppers to cover the period
The varieties should be as few as is
there is no advantage and some dis-
age in having too many varieties.
conditions influence the selection of
es, and we would urge our readers to
exactly what varieties suit the soil and
t. It is far better to grow a suitable
well than to waste many years in try-
grow something which does not like
il. All wish to grow Cox's Orange
, but a well-grown Allington is better
badly-grown Cox.

RECT LABELLING.—Many plant Apples
en promptly lose the names. As the
ome into bearing a desire to know the
is raised. Samples are collected and
sent to this, that, or another authority. If the variety is a largely grown commercial sort and the specimens sent are typical the naming is fairly easy. Those who know Apples best will be the first to admit that to name varieties is generally guesswork, and that the easiest way of being sure of the variety is to keep it labelled. We should be saved much work if this was always done. Incorrect labelling from the nursery does on occasion happen, but it is rare with a good firm. If doubt arises as to a variety being true to name an expert can usually say whether or no it is correct.

ANIMAL DAMAGE.—All newly planted trees should be protected from rabbits and hares. Valuable trees can be ruined in a night by these creatures, and not only are the trees ruined, but a year's growth is lost, because one must start again.

SHELTER.—Apples, like most other plants, do not like exposed situations. Wind is the cause of many failures, and it is not generally realised that it is the S.W., W., and N.W. winds that are most to be feared. N. and E. winds do little damage to Apples.

Apricots on walls

BOTH Peaches and Apricots gave good accounts of themselves last summer, the trees carrying full crops. Of the richness and lusciousness of well-ripened Apricots there can be no two questions, and it is surprising they are not more frequently met with in amateurs' gardens. Apricots can only be grown in this country as trained trees on walls, houses, or closed fences in the warm parts of the country. East and west aspects are suitable, but those of south-east or south-west are to be preferred, whilst in the northern parts a southern aspect is essential. The Apricot will succeed in any good garden soil or loam; if rather sandy than otherwise the better. Soils of a strong, clayey nature do not suit it, but these may be improved by the addition of light garden soil, sand, or lime-rubble. In adding any of these, incorporate them thoroughly with the natural soil before planting the trees. The ground must be well drained, and if not naturally so it must be drained in the usual way. There is no need for wide borders, 3 feet to 5 feet being quite broad enough. My plan is to confine the roots to this width by cutting a trench the whole length of the border at this distance from the wall and two spits deep. By this system the trees are prevented from growing too strongly, and when the roots are confined they are better supplied with water and liquid nourishment in dry weather, and carrying heavy crops of fruit.

I consider the best time for planting to be the end of September or commencement of October, as the soil is then warm, and fresh roots form before winter and will start more vigorously in spring than when planted later. Early planting, however, is not absolutely essential, and so long as the soil is not frozen, the trees may be planted all through the winter, but not later than the middle of February. The best trees to plant are the dwarf fan-trained, inserting them 12 feet apart. Some growers, I know, advise a greater space, but Apricots, unfortunately, are liable to go off partially or wholly in a most unaccountable manner, and the gap is then not so difficult to fill with a young tree. To secure a greater crop a fan-trained standard or rider may be planted between the dwarf-trained trees.

The fruit is produced on shoots of the preceding summer's growth, and also on spurs two or more years old. Train the main branches to diverge equally, say, 10 inches or 12 inches apart, and when extended far enough they may be sub-divided so as to be the same distance apart again, repeating this as the tree extends. Some young wood may then be laid in between the main branches, and this wood frequently produces the finest fruit. Spurs should be allowed to form along the branches, but not too thickly, and any young shoots which push from them to two or three buds when they have attained a few inches in length should be pinched back. All the pruning required in winter is to cut back any long spurs or shoots passed over in the growing season. For fastening the shoots to the wall, the finest things are the lead-headed malleable wall nails, which, although holding the branch or shoot firmly, allow it to expand. Shreds which harbour so many insects are entirely done away with.

As the blossoms of the Apricot appear early in the season they are liable to be cut off by frost, therefore protection must be given at this critical time. I find the best means of protecting both Apricots and Peaches is to fix a strong, stout wire stretched very tightly just under the coping. Hessian curtains are then run on this, reaching nearly to the ground. The curtains are hung on the wire with brass hooks, which slide backwards and forwards as required. At every 6 feet or 7 feet poles are fixed to prevent the curtains blowing against the trees. This protection is well worth fixing up, as the curtains can be run in front of the trees in a few minutes. If protected from frost, Apricots set their fruit thickly, therefore thinning must be liberally carried out. Leave the largest and best shaped fruits for the crop; the thinnings may be used for tarts. The trees, when carrying heavy crops, must be kept moist, and in dry weather have copious supplies of water and liquid nourishment. Insects are often troublesome, one of the worst being a small, light-green caterpillar which does great injury to the leaves. The only remedy is to go over the trees daily, squeeze all leaves that are curled, and so destroy the caterpillars. Scale also attacks the trees and must be destroyed with an insecticide when the trees are dormant. Aphis is sometimes troublesome during summer and is best destroyed by fumigation under sheeting temporarily put up, selecting a quiet evening for the operation. Whole branches of the Apricot sometimes die off without any apparent cause. Some attribute this to sunstroke, some to severe frost. My experience teaches me that the cause is allowing the roots to become too dry in hot weather. Three good varieties are Moorpark, Hemskirk, and Shipley.

Restrictions on Potato planting

The Ministry of Agriculture has recently had under consideration the question of what further steps could be taken to guard against the appearance of Wart Disease in the important Potato-growing areas around Boston and Wisbech. A considerable quantity of the produce of the Potato fields in this district is exported every year to other countries for use as seed, but the trade is dependent on the continued freedom of the producing districts from Wart Disease, because practically all the importing countries require a certificate from the Ministry that there has been no case of Wart Disease within at least 5 kilometres of the place where the Potatoes were grown. A slight outbreak, even one in a cottage garden, in the producing districts would, therefore, result in stopping the export of Potatoes from an area of about 30 square miles, and a few such outbreaks might entirely prevent the export of Potatoes from the whole of this important district.

More than 90 per cent. of the outbreaks of Wart Disease recorded in this country have occurred in private gardens and allotments, and it was considered that an additional safeguard would be provided by the issue of an

Order restricting Potato planting in such premises to certified stocks of immune varieties, *i.e.*, Potatoes which are the subject of a "True Stock" certificate. This suggestion was favourably received by the two National Societies representing allotment holders and by the Minister's Potato Advisory Committee, which is comprised of representatives of all the important associations interested in the Potato trade; this Committee recommended that action on the lines indicated should be taken.

The Minister has accordingly made the Wart Disease of Potatoes (Amendment) Order of 1929, which comes into force on January 1st, 1930. It applies to the following area:—The administrative county of Lincoln (parts of Holland), including the Borough of Boston; the Petty Sessional Division of Wisbech and the Borough of Wisbech in the administrative county of the Isle of Ely, and the Petty Sessional Division of Freebridge Marshland, and the Borough of King's Lynn in the administrative county of Norfolk. Within this area the planting is prohibited in any allotment not exceeding a quarter of an acre in extent, or in any private garden, of any Potatoes which are not certified stocks of an approved immune variety. Exceptions from this requirement have, however, been made in respect of (1) the following five early varieties, which are not immune from the disease:—Sharpe's Express, Eclipse, Epicure, May Queen, and Duke of York; (2) Potatoes of immune varieties saved from the crop grown on the same land in the previous year; and (3) before June 30th, 1930, any Potatoes saved from the crop grown on the same land in 1929.

Copies of the Order and lists of the approved immune varieties may be obtained on application to the Secretary, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W. 1.

The Potato crop

The yield per acre of Potatoes is estimated at 6·9 tons which, although ⅘ ton above the ten years' average is about ⅓ ton lower than the record yield of 1928. There is, however, an increase in the acreage, and the resulting total production is consequently higher than the heavy crop of last year, being estimated at 3,588,000 tons, as compared with 3,513,000 tons in 1928. The best average yields per acre were obtained in Norfolk where the average of 9·9 tons was 2·6 tons per acre above the average for the county, and in the Isle of Ely where the yield of 8·1 tons per acre was 1·5 tons above the county average.

Shelter hedges of evergreen

On a windy day one can enjoy the garden better when walking in the shelter of a Yew hedge that protects our choice plants. As a hedge plant on boundaries the Yew is too poisonous to live-stock, but in the garden it may be safely employed. Provided the site is deeply dug and manured, the Yew is not so slow-growing as some imagine. If the young plants are kept clean and a dressing of nitrate of soda given during the growing period, their rate of progress will be fairly rapid. Another good hedge plant is Berberis stenophylla, a close grower, and very prickly. After flowering it can be cut back to restrict to hedge proportions. Viburnum tinus (Laurustinus) also makes a good shelter hedge. Not only is it evergreen, but flowers the winter through. From time to time cut it back into shape like the Berberis. Cupressus macrocarpa also makes an excellent screen.

F. H.

Belladonna Lilies

BELLADONNA LILIES are justly claimed to be amongst the most beautiful of autumn-flowering bulbous plants. Coming from South Africa it is reasonable to suggest that they are not hardy in all parts of this country except in the southern and western counties. It is possible, however, to grow them successfully inland. A site should be chosen for them on the south side of a house or wall, where the plants will receive the full benefit of the reflected heat and sunshine. This is essential for the ripening process, to enable the production of the delicate pink and white clusters of flowers, which are borne on stout, leafless scapes, from 1½ feet to 3 feet high, arising from the large Pear-shaped bulbs. Flowering after the leaves have disappeared, there is naturally an interval of nakedness before they throw up their scapes. In early autumn there is an absence of rich colours among hardy plants such as Belladonna Lilies provide, hence they are all the more worthy of cultivation with a view to providing a display of bloom in early autumn. Besides the typical form, there are several important varieties of Amaryllis Belladonna known respectively as A. B. maxima, A. B. blanda, and A. B. kewensis, all of which are distinct and of excellent merit. The three varieties above mentioned are characterised by a more vigorous habit, freedom of flowering, and richer colour than the typical kind, the latter having dwarfer scapes bearing flowers of a paler hue. There is also a variety called A. B. alba. In addition to the above there are a number of varieties said to be bigeneric hybrids between Brunsvigia Josephinæ, a many-flowered bulbous plant from the Cape of Good Hope, and Amaryllis Belladonna. When deciding to plant Belladonna Lilies, a suitable site should be selected and the ground thoroughly prepared. The soil should be taken out to a depth of about 3 feet, and 6 inches of broken bricks or other material placed at the bottom form drainage. Then cover with a g layer of half-rotted manure to keep drainage open, which ultimately will as in feeding the plants. If the natural soi poor or unsuitable it will be advisable replace it with good fibrous loam, leaf-s and sand in suitable proportions. This sho be made firm by treading as the work filling-in proceeds. Plant the bulbs in sn groups about 1 foot apart. If the sp allotted allows for more than one row, clumps in the second row should be al nately planted with those in the first. Ins the bulbs 6 inches to 8 inches deep and co them with sharp sand to keep them fr rotting. A good time to plant is during summer after the foliage has died do when root action commences before flower-stems are sent up. They may also planted in autumn after flowering. Onc border has been planted it should be severely alone for a number of years as plants are impatient of removal or distu ance of any kind and slow to recover.

During dry weather, and when plants are making growth, an occasio soaking of clear water and liquid-man will be very beneficial. As the plants be to push forth new leaves in the ea spring they should be given protection fr spring frosts. The bloom in the autumn dependent on the freedom and the heal condition of these, so that injury to leaves should be carefully avoided. Rem the foliage as it ripens off, and clean border before the blooms begin to p through the soil. Although Belladonna Li are reputed to be somewhat erratic and certain in their flowering—largely attrib able to climatic conditions prevailing in t country—these sun and warmth-loving s jects well repay for the periods of waiti and enrich the garden with one of the b of early autumn blooming plants in seas when they do well.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants be named should send fair examples of each— stem, leaf, flower, or fruit. (Snippets of lea and points of shoots are useless.) Not more th four plants should be sent in any one week by t same correspondent. Where more than one ki is sent they should be numbered. Of conifers t cones should always be sent.*

Naming fruit—*Several specimens in differe stages of colour and size of the same kind grea assist in its determination. Single, unripe, deformed specimens are difficult to name. do not undertake to name more than fo varieties at one time.*

Twelve good early flowering Chrysanthemums

(King's Co.).—The varieties referred to on page 819, issue December 7th, 1929, could be obtained of Messrs. H. J. Jones, Ltd., Ryecroft Nursery, Lewisham, S.E., or any other well-known Chrysanthemum specialist.

NAMES OF PLANTS

Mrs. A. B., Ilnacullin.—1, Pinus Pinaster (Maritime Pine), native of the Mediterranean region; 2, Pinus montana, native of Central and S.E. Europe, common in cultivation; 3, Pinus contorta with rather large cones, native of Western N. America, approaching var. Murrayana; 4, Pinus halepensis, native of Mediterranean region, rare in cultivation.

C. E. M., Thurlestone.—Osmanthus illicifolius syn. O. Fortunei. Yes; these flowers which are produced in autumn are white a fragrant.

NAMES OF FRUITS

Wm. B., Essex.—1, Northern Greening; Beauty of Hants.; 3, Wellington (Du melow's Seedling).

A. K., Aston.—1, Lady Henniker; Northern Greening; 3, Hubbard's Pearma 4, Golden Pippin; 5, Scarlet Nonpareil; Paroquet.

Peg.—1, King Harry; 2, Yorksh Beauty; 3, Nonpareil; 4, Pear Gansel-Seck 5, Pear Catillac (small fruit); 6, Pear Bu Dumont (small fruit).

"OXFORD ROADLESS" BARROWS

are ideal for carrying loads over soft and uneven ground which an ordinary wheelbarrow cannot face satisfactorily

A HIGH-GRADE PRODUCTION CONSTRUCTED OF THOROUGHLY SEASONED TIMBER

The following are extracts from a few of the many appreciative letters received:

"The barrows have been in daily use for the past five months under all conditions, viz.: over rough, smooth, and boggy ground, and we have pleasure in testifying to their efficiency."

"I have nothing but praise for your Creeper tracks, especially on a three-creeper truck which you made for me a year ago, and I cannot speak too highly of its work."

" We now have a good many of these barrows in use, and they are a great saving in labour. We would not be without them for anything."

"Nearly twelve months ago we purchased a barrow fitted with one of your track wheels. We found this very useful, and far superior to the old style of wheel."
